  The projection must have a sufficient number of buddy projections and all nodes must be up before starting a refresh
WARNING 4468: Projection <store.p_store_orders_b1> is not available for query processing. Execute the select start_refresh() function to copy data into this projection.
  The projection must have a sufficient number of buddy projections and all nodes must be up before starting a refresh
CREATE PROJECTION
=> SELECT export_objects(", 'store.p_store_orders_b0');
...
CREATE PROJECTION store.p_store_orders_b0 /*+basename(p_store_orders)*/
(
  product_key,
  product_version,
  store_key,
  order_number
)
AS
SELECT store_orders_fact.product_key,
       store_orders_fact.product_version,
       store_orders_fact.store_key,
       store_orders_fact.order_number
FROM store.store_orders_fact
ORDER BY store_orders_fact.product_key,
         store_orders_fact.product_version,
         store_orders_fact.store_key,
         store_orders_fact.order_number
SEGMENTED BY hash(store_orders_fact.product_key, store_orders_fact.product_version, store_orders_fact.store_key, store_orders_fact.order_number)
ALL NODES OFFSET 0;

SELECT MARK_DESIGN_KSAFE(1);

(1 row)

```

As shown in the EXPORT_OBJECTS output, Vertica stores the result sets of the two MATCH_COLUMNS calls in the new projection's DDL. Later changes in the anchor table DDL have no effect on this projection.

REGEXP_COUNT

Returns the number times a regular expression matches a string.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

Important

If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_COUNT ( string-expression, pattern [, position [, regexp-modifier]... ] )
```

Parameters

string-expression

The **VARCHAR** or **LONG VARCHAR** expression to evaluate for matches with the regular expression specified in ***pattern*** . If ***string-expression*** is in the **__raw__** column of a flex or columnar table, cast the string to a **LONG VARCHAR** before searching for ***pattern*** .

pattern

The regular expression to match against *string-expression*. The regular expression must conform with [Perl regular expression syntax](#).

position

The number of characters from the start of the string where the function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the *n*th character you specify.

Default: 1

regexp-modifier

One or more single-character flags that modify how the regular expression *pattern* is matched to *string-expression*:

- **b**: Treat strings as binary octets, rather than UTF-8 characters.
- **c** (default): Force the match to be case sensitive.
- **i**: Force the match to be case insensitive.
- **m**: Treat the string to match as multiple lines. Using this modifier, the start of line (`^`) and end of line (`$`) regular expression operators match line breaks (`\n`) within the string. Without the **m** modifier, the start and end of line operators match only the start and end of the string.
- **n**: Match the regular expression operator (`.`) to a newline (`\n`). By default, the `.` operator matches any character except a newline.
- **x**: Add comments to regular expressions. The **x** modifier causes the function to ignore all un-escaped space characters and comments in the regular expression. Comments start with hash (`#`) and end with a newline (`\n`). All spaces in the regular expression to be matched in strings must be escaped with a backslash (`\`).

Examples

Count the number of occurrences of the substring **an** in the specified string (**a man, a plan, a canal: Panama**):

```
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', 'an');
REGEXP_COUNT
-----
         4
(1 row)
```

Find the number of occurrences of the substring **an**, starting with the fifth character.

```
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', 'an',5);
REGEXP_COUNT
-----
         3
(1 row)
```

Find the number of occurrences of a substring containing a lower-case character followed by **an**:

```
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', '[a-z]an');
REGEXP_COUNT
-----
         3
(1 row)
```

REGEXP_COUNT specifies the **i** modifier, so it ignores case:

```
=> SELECT REGEXP_COUNT('a man, a plan, a canal: Panama', '[a-z]an', 1, 'i');
REGEXP_COUNT
-----
         4
```

REGEXP_ILIKE

Returns true if the string contains a match for the regular expression. REGEXP_ILIKE is similar to the [LIKE](#), except that it uses a case insensitive regular expression, rather than simple wildcard character matching.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

Important
If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_ILIKE ( string-expression, pattern )
```

Parameters

string-expression

The **VARCHAR** or **LONG VARCHAR** expression to evaluate for matches with the regular expression specified in *pattern* . If *string-expression* is in the `__raw__` column of a flex or columnar table, cast the string to a **LONG VARCHAR** before searching for *pattern* .

pattern

The regular expression to match against *string-expression* . The regular expression must conform with [Perl regular expression syntax](#) .

Examples

This example creates a table containing several strings to demonstrate regular expressions.

1. Create table `longvc` with a single, long varchar column `body` , and insert data with distinct characters:

```
=> CREATE table longvc(body long varchar (1048576));
CREATE TABLE

=> insert into longvc values ('Ha берегу пустынных волн');
=> insert into longvc values ('Voin syödä lasia, se ei vahingoita minua');
=> insert into longvc values ('私はガラスを食べられます。それは私を傷つけません。');
=> insert into longvc values ('Je peux manger du verre, ça ne me fait pas mal. ');
=> insert into longvc values ('zésbaésbaa');
=> insert into longvc values ('Out of the frying pan, he landed immediately in the fire');

=> SELECT * FROM longvc;
      body
-----
Ha берегу пустынных волн
Voin syödä lasia, se ei vahingoita minua
私はガラスを食べられます。それは私を傷つけません。
Je peux manger du verre, ça ne me fait pas mal.
zésbaésbaa
Out of the frying pan, he landed immediately in the fire
(6 rows)
```

2. Pattern match table rows containing the character `ç` :

```
=> SELECT * FROM longvc where regexp_ilike(body, 'ç');
      body
-----
Je peux manger du verre, ça ne me fait pas mal.
(1 row)
```

3. Select all rows that contain the characters `A / a` :

```
=> SELECT * FROM longvc where regexp_ilike(body, 'A');
      body
-----
Je peux manger du verre, ça ne me fait pas mal.
Voin syödä lasia, se ei vahingoita minua
zésbaésbaa
(3 rows)
```

4. Select all rows that contain the characters `O / o` :

```
=> SELECT * FROM longvc where regexp_ilike(body, 'O');
      body
-----
```

```
Voin syödä lasia, se ei vahingoita minua
Out of the frying pan, he landed immediately in the fire
(2 rows)
```

REGEXP_INSTR

Returns the starting or ending position in a string where a regular expression matches. REGEXP_INSTR returns 0 if no match for the regular expression is found in the string.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

Important
If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_INSTR ( string-expression, pattern
              [, position [, occurrence [, return-position [, regexp-modifier ]... [, captured-subexp ]]] )
```

Parameters

string-expression

The **VARCHAR** or **LONG VARCHAR** expression to evaluate for matches with the regular expression specified in *pattern* . If *string-expression* is in the `__raw__` column of a flex or columnar table, cast the string to a **LONG VARCHAR** before searching for *pattern* .

pattern

The regular expression to match against *string-expression* . The regular expression must conform with [Perl regular expression syntax](#) .

position

The number of characters from the start of the string where the function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the * n *th character you specify.

Default: 1

occurrence

Controls which occurrence of a pattern match in the string to return. By default, the function returns the position of the first matching substring. Use this parameter to find the position of subsequent matching substrings. For example, setting this parameter to 3 returns the position of the third substring that matches the pattern.

Default: 1

return-position

Sets the position within the string to return. Using the default position (0), the function returns the string position of the first character of the substring that matches the pattern. If you set *return-position* to 1, the function returns the position of the first character after the end of the matching substring.

Default: 0

regexp-modifier

One or more single-character flags that modify how the regular expression *pattern* is matched to *string-expression* :

- **b** : Treat strings as binary octets, rather than UTF-8 characters.
- **c** (default): Force the match to be case sensitive.
- **i** : Force the match to be case insensitive.
- **m** : Treat the string to match as multiple lines. Using this modifier, the start of line (`^`) and end of line (`$`) regular expression operators match line breaks (`\n`) within the string. Without the **m** modifier, the start and end of line operators match only the start and end of the string.
- **n** : Match the regular expression operator (`.`) to a newline (`\n`). By default, the `.` operator matches any character except a newline.
- **x** : Add comments to regular expressions. The **x** modifier causes the function to ignore all un-escaped space characters and comments in the regular expression. Comments start with hash (`#`) and end with a newline (`\n`). All spaces in the regular expression to be matched in

strings must be escaped with a backslash (\).

captured-subexp

The captured subexpression whose position to return. By default, the function returns the position of the first character in *string* that matches the regular expression. If you set this value from 1 – 9, the function returns the subexpression captured by the corresponding set of parentheses in the regular expression. For example, setting this value to 3 returns the substring captured by the third set of parentheses in the regular expression.

Default: 0

Note

The subexpressions are numbered left to right, based on the appearance of opening parenthesis, so nested regular expressions. For example, in the regular expression `\s*(w+\s+(w+))`, subexpression 1 is the one that captures everything but any leading whitespaces.

Examples

Find the first occurrence of a sequence of letters starting with the letter **e** and ending with the letter **y** in the specified string (**easy come, easy go**).

```
=> SELECT REGEXP_INSTR('easy come, easy go','e\w*y');
REGEXP_INSTR
-----
          1
(1 row)
```

Starting at the second character (**2**), find the first sequence of letters starting with the letter **e** and ending with the letter **y** :

```
=> SELECT REGEXP_INSTR('easy come, easy go','e\w*y',2);
REGEXP_INSTR
-----
         12
(1 row)
```

Starting at the first character (**1**), find the second sequence of letters starting with the letter **e** and ending with the letter **y** :

```
=> SELECT REGEXP_INSTR('easy come, easy go','e\w*y',1,2);
REGEXP_INSTR
-----
         12
(1 row)
```

Find the position of the first character after the first whitespace:

```
=> SELECT REGEXP_INSTR('easy come, easy go','\s',1,1,1);
REGEXP_INSTR
-----
          6
(1 row)
```

Find the position of the start of the third word in a string by capturing each word as a subexpression, and returning the third subexpression's start position.

```
=> SELECT REGEXP_INSTR('one two three','(w+)\s+(w+)\s+(w+)', 1,1,0,',3);
REGEXP_INSTR
-----
          9
(1 row)
```

REGEXP_LIKE

Returns true if the string matches the regular expression. REGEXP_LIKE is similar to the [LIKE](#), except that it uses regular expressions rather than simple wildcard character matching.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

Important

If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_LIKE ( string-expression, pattern [, regex-modifier]... )
```

Parameters

string-expression

The **VARCHAR** or **LONG VARCHAR** expression to evaluate for matches with the regular expression specified in *pattern* . If *string-expression* is in the `__raw__` column of a flex or columnar table, cast the string to a **LONG VARCHAR** before searching for *pattern* .

pattern

The regular expression to match against *string-expression* . The regular expression must conform with [Perl regular expression syntax](#) .

regex-modifier

One or more single-character flags that modify how the regular expression *pattern* is matched to *string-expression* :

- **b** : Treat strings as binary octets, rather than UTF-8 characters.
- **c** (default): Force the match to be case sensitive.
- **i** : Force the match to be case insensitive.
- **m** : Treat the string to match as multiple lines. Using this modifier, the start of line (`^`) and end of line (`$`) regular expression operators match line breaks (`\n`) within the string. Without the **m** modifier, the start and end of line operators match only the start and end of the string.
- **n** : Match the regular expression operator (`.`) to a newline (`\n`). By default, the `.` operator matches any character except a newline.
- **x** : Add comments to regular expressions. The **x** modifier causes the function to ignore all un-escaped space characters and comments in the regular expression. Comments start with hash (`#`) and end with a newline (`\n`). All spaces in the regular expression to be matched in strings must be escaped with a backslash (`\`).

Examples

Create a table that contains several strings:

```
=> CREATE TABLE t (v VARCHAR);
CREATE TABLE
=> CREATE PROJECTION t1 AS SELECT * FROM t;
CREATE PROJECTION
=> COPY t FROM stdin;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> aaa
>> Aaa
>> abc
>> abc1
>> 123
>> \.
=> SELECT * FROM t;
  v
-----
aaa
Aaa
abc
abc1
123
(5 rows)
```

Select all records from table `t` that contain the letter `a` :

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'a');
```

```
v  
-----  
Aaa  
aaa  
abc  
abc1  
(4 rows)
```

Select all rows from table `t` that start with the letter `a` :

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'^a');
```

```
v  
-----  
aaa  
abc  
abc1  
(3 rows)
```

Select all rows that contain the substring `aa` :

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'aa');
```

```
v  
-----  
Aaa  
aaa  
(2 rows)
```

Select all rows that contain a digit.

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'d');
```

```
v  
-----  
123  
abc1  
(2 rows)
```

Select all rows that contain the substring `aaa` .

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'aaa');
```

```
v  
-----  
aaa  
(1 row)
```

Select all rows that contain the substring `aaa` using case-insensitive matching.

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'aaa', 'i');
```

```
v  
-----  
Aaa  
aaa  
(2 rows)
```

Select rows that contain the substring `a b c` .

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'a b c');
```

```
v  
----  
(0 rows)
```

Select rows that contain the substring `a b c` , ignoring space within the regular expression.

```
=> SELECT v FROM t WHERE REGEXP_LIKE(v,'a b c','x');
v
-----
abc
abc1
(2 rows)
```

Add multi-line rows to table `t`:

```
=> COPY t FROM stdin RECORD TERMINATOR '!';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> Record 1 line 1
>> Record 1 line 2
>> Record 1 line 3!
>> Record 2 line 1
>> Record 2 line 2
>> Record 2 line 3!
>> \.
```

Select rows from table `t` that start with the substring `Record` and end with the substring `line 2`.

```
=> SELECT v from t WHERE REGEXP_LIKE(v,'^Record.*line 2$');
v
---
(0 rows)
```

Select rows that start with the substring `Record` and end with the substring `line 2`, treating multiple lines as separate strings.

```
=> SELECT v from t WHERE REGEXP_LIKE(v,'^Record.*line 2$', 'm');
v
-----
Record 2 line 1
Record 2 line 2
Record 2 line 3
Record 1 line 1
Record 1 line 2
Record 1 line 3
(2 rows)
```

REGEXP_NOT_ILIKE

Returns true if the string does not match the case-insensitive regular expression.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

Important

If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_NOT_ILIKE ( string-expression, pattern )
```

Parameters

string-expression

The `VARCHAR` or `LONG VARCHAR` expression to evaluate for matches with the regular expression specified in *pattern*. If *string-expression* is in the `__raw__` column of a flex or columnar table, cast the string to a `LONG VARCHAR` before searching for *pattern*.

pattern

The regular expression to match against *string-expression*. The regular expression must conform with [Perl regular expression syntax](#).

Examples

1. Create a table (`longvc`) with a single, long varchar column (`body`). Then, insert data with some distinct characters, and query the table contents:

```
=> CREATE table longvc(body long varchar (1048576));
CREATE TABLE

=> insert into longvc values ('Ha бepeгy пyстынных волн');
=> insert into longvc values ('Voin syödä lasia, se ei vahingoita minua');
=> insert into longvc values ('私はガラスを食べられます。それは私を傷つけません。');
=> insert into longvc values ('Je peux manger du verre, ça ne me fait pas mal. ');
=> insert into longvc values ('zésbaésbaa');

=> SELECT * FROM longvc;
      body
-----
Ha бepeгy пyстынных волн
Voin syödä lasia, se ei vahingoita minua
私はガラスを食べられます。それは私を傷つけません。
Je peux manger du verre, ça ne me fait pas mal.
zésbaésbaa
(5 rows)
```

2. Find all rows that do not contain the character `ç` :

```
=> SELECT * FROM longvc where regexp_not_ilike(body, 'ç');
      body
-----
Voin syödä lasia, se ei vahingoita minua
zésbaésbaa
Ha бepeгy пyстынных волн
私はガラスを食べられます。それは私を傷つけません。
(4 rows)
```

3. Find all rows that do not contain the substring `a` :

```
=> SELECT * FROM longvc where regexp_not_ilike(body, 'a');
      body
-----
Ha бepeгy пyстынных волн
私はガラスを食べられます。それは私を傷つけません。
(2 rows)
```

REGEXP_NOT_LIKE

Returns true if the string does not contain a match for the regular expression. REGEXP_NOT_LIKE is a case sensitive regular expression.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

Important

If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_NOT_LIKE ( string-expression, pattern )
```

Parameters

string-expression

The **VARCHAR** or **LONG VARCHAR** expression to evaluate for matches with the regular expression specified in *pattern* . If *string-expression* is in the `__raw__` column of a flex or columnar table, cast the string to a **LONG VARCHAR** before searching for *pattern* .

pattern

The regular expression to match against *string-expression* . The regular expression must conform with [Perl regular expression syntax](#) .

Examples

1. Create a table (`longvc`) with the LONG VARCHAR column `body` . Then, insert data with some distinct characters and query the table contents:

```

=> CREATE table longvc(body long varchar (1048576));
CREATE TABLE

=> insert into longvc values ('На берегу пустынных волн');
=> insert into longvc values ('Voin syödä lasia, se ei vahingoita minua');
=> insert into longvc values ('私はガラスを食べられます。それは私を傷つけません。');
=> insert into longvc values ('Je peux manger du verre, ça ne me fait pas mal. ');
=> insert into longvc values ('zésbaésbaa');

=> SELECT * FROM longvc;
      body
-----
На берегу пустынных волн
Voin syödä lasia, se ei vahingoita minua
私はガラスを食べられます。それは私を傷つけません。
Je peux manger du verre, ça ne me fait pas mal.
zésbaésbaa
(5 rows)

```

2. Use **REGEXP_NOT_LIKE** to return rows that do not contain the character ç :

```

=> SELECT * FROM longvc where regexp_not_like(body, 'ç');
      body
-----
Voin syödä lasia, se ei vahingoita minua
zésbaésbaa
На берегу пустынных волн
私はガラスを食べられます。それは私を傷つけません。
(4 rows)

```

3. Return all rows that do not contain the characters *ö and *ä :

```

=> SELECT * FROM longvc where regexp_not_like(body, '.*ö.*ä');
      body
-----
Je peux manger du verre, ça ne me fait pas mal.
zésbaésbaa
На берегу пустынных волн
私はガラスを食べられます。それは私を傷つけません。
(4 rows)

```

4. Pattern match all rows that do not contain the characters z and *ésbaa :

```

=> SELECT * FROM longvc where regexp_not_like(body, 'z.*ésbaa');
      body
-----
Je peux manger du verre, ça ne me fait pas mal.
Voin syödä lasia, se ei vahingoita minua
zésbaésbaa
На берегу пустынных волн
私はガラスを食べられます。それは私を傷つけません。
(5 rows)

```

REGEXP_REPLACE

Replaces all occurrences of a substring that match a regular expression with another substring. REGEXP_REPLACE is similar to the [REPLACE](#) function, except it uses a regular expression to select the substring to be replaced.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

Important

If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_REPLACE ( string-expression, target  
[, replacement [, position [, occurrence[...] [, regexp-modifier]]]] )
```

Parameters

string-expression

The **VARCHAR** or **LONG VARCHAR** expression to evaluate for matches with the regular expression specified in *pattern* . If *string-expression* is in the `__raw__` column of a flex or columnar table, cast the string to a **LONG VARCHAR** before searching for *pattern* .

pattern

The regular expression to match against *string-expression* . The regular expression must conform with [Perl regular expression syntax](#) .

replacement

The string to replace matched substrings. If you do not supply a *replacement* , the function deletes matched substrings. The replacement string can contain backreferences for substrings captured by the regular expression. The first captured substring is inserted into the replacement string using `\1` , the second `\2` , and so on.

position

The number of characters from the start of the string where the function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the *n* -th character you specify.

Default: 1

occurrence

Controls which occurrence of a pattern match in the string to replace. By default, the function replaces all matching substrings. For example, setting this parameter to 3 replaces the third matching instance.

Default: 1

regexp-modifier

One or more single-character flags that modify how the regular expression *pattern* is matched to *string-expression* :

- **b** : Treat strings as binary octets, rather than UTF-8 characters.
- **c** (default): Force the match to be case sensitive.
- **i** : Force the match to be case insensitive.
- **m** : Treat the string to match as multiple lines. Using this modifier, the start of line (`^`) and end of line (`$`) regular expression operators match line breaks (`\n`) within the string. Without the **m** modifier, the start and end of line operators match only the start and end of the string.
- **n** : Match the regular expression operator (`.`) to a newline (`\n`). By default, the `.` operator matches any character except a newline.
- **x** : Add comments to regular expressions. The **x** modifier causes the function to ignore all un-escaped space characters and comments in the regular expression. Comments start with hash (`#`) and end with a newline (`\n`). All spaces in the regular expression to be matched in strings must be escaped with a backslash (`\`).

How Oracle handles subexpressions

Unlike Oracle, Vertica can handle an unlimited number of captured subexpressions, while Oracle is limited to nine.

In Vertica, you can use `\10` in the replacement pattern to access the substring captured by the tenth set of parentheses in the regular expression. In Oracle, `\10` is treated as the substring captured by the first set of parentheses, followed by a zero. To force this Oracle behavior in Vertica, use the `\g` back reference and enclose the number of the captured subexpression in curly braces. For example, `\g{1}0` is the substring captured by the first set of parentheses followed by a zero.

You can also name captured subexpressions to make your regular expressions less ambiguous. See the [PCRE](#) documentation for details.

Examples

Find groups of word characters—letters, numbers and underscore—that end with **thy** in the string **healthy, wealthy, and wise** , and replace them with nothing.

```
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise', '\w+thy');  
REGEXP_REPLACE  
-----  
, , and wise  
(1 row)
```

Find groups of word characters ending with **thy** and replace with the string **something** .

```
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise', 'w+thy', 'something');
       REGEXP_REPLACE
-----
something, something, and wise
(1 row)
```

Find groups of word characters ending with **thy** and replace with the string **something** starting at the third character in the string.

```
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise', 'w+thy', 'something', 3);
       REGEXP_REPLACE
-----
hesomething, something, and wise
(1 row)
```

Replace the second group of word characters ending with **thy** with the string **something** .

```
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise', 'w+thy', 'something', 1, 2);
       REGEXP_REPLACE
-----
healthy, something, and wise
(1 row)
```

Find groups of word characters ending with **thy** capturing the letters before the **thy** , and replace with the captured letters plus the letters **ish** .

```
=> SELECT REGEXP_REPLACE('healthy, wealthy, and wise', '(w+)thy', '\1ish');
       REGEXP_REPLACE
-----
healish, wealish, and wise
(1 row)
```

Create a table to demonstrate replacing strings in a query.

```
=> CREATE TABLE customers (name varchar(50), phone varchar(11));
CREATE TABLE
=> CREATE PROJECTION customers1 AS SELECT * FROM customers;
CREATE PROJECTION
=> COPY customers FROM stdin;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> Able, Adam|17815551234
>> Baker,Bob|18005551111
>> Chu,Cindy|16175559876
>> Dodd,Dinara|15083452121
>> \.
```

Query the customers, using REGEXP_REPLACE to format phone numbers.

```
=> SELECT name, REGEXP_REPLACE(phone, '(\d)(\d{3})(\d{3})(\d{4})',
'\1-(\2) \3-\4') as phone FROM customers;
   name | phone
-----+-----
Able, Adam | 1-(781) 555-1234
Baker,Bob | 1-(800) 555-1111
Chu,Cindy | 1-(617) 555-9876
Dodd,Dinara | 1-(508) 345-2121
(4 rows)
```

REGEXP_SUBSTR

Returns the substring that matches a regular expression within a string. If no matches are found, REGEXP_SUBSTR returns NULL. This is different from an empty string, which the function can return if the regular expression matches a zero-length string.

This function operates on UTF-8 strings using the default locale, even if the locale is set otherwise.

Important
If you port a regular expression query from an Oracle database, remember that Oracle considers a zero-length string to be equivalent to NULL, while Vertica does not.

Syntax

```
REGEXP_SUBSTR ( string-expression, pattern  
[, position [, occurrence [, regexp-modifier [, captured-subexp]]... ] )
```

Parameters

string-expression

The **VARCHAR** or **LONG VARCHAR** expression to evaluate for matches with the regular expression specified in *pattern* . If *string-expression* is in the `__raw__` column of a flex or columnar table, cast the string to a **LONG VARCHAR** before searching for *pattern* .

pattern

The regular expression to match against *string-expression* . The regular expression must conform with [Perl regular expression syntax](#) .

position

The number of characters from the start of the string where the function should start searching for matches. By default, the function begins searching for a match at the first (leftmost) character. Setting this parameter to a value greater than 1 begins searching for a match at the *n* -th character you specify.

Default: 1

occurrence

Controls which occurrence of a pattern match in the string to return. By default, the function returns the first matching substring. For example, setting this parameter to 3 returns the third matching instance.

Default: 1

regexp-modifier

One or more single-character flags that modify how the regular expression *pattern* is matched to *string-expression* :

- **b** : Treat strings as binary octets, rather than UTF-8 characters.
- **c** (default): Force the match to be case sensitive.
- **i** : Force the match to be case insensitive.
- **m** : Treat the string to match as multiple lines. Using this modifier, the start of line (`^`) and end of line (`$`) regular expression operators match line breaks (`\n`) within the string. Without the **m** modifier, the start and end of line operators match only the start and end of the string.
- **n** : Match the regular expression operator (`.`) to a newline (`\n`). By default, the `.` operator matches any character except a newline.
- **x** : Add comments to regular expressions. The **x** modifier causes the function to ignore all un-escaped space characters and comments in the regular expression. Comments start with hash (`#`) and end with a newline (`\n`). All spaces in the regular expression to be matched in strings must be escaped with a backslash (`\`).

captured-subexp

The group to return. By default, the function returns all matching groups. For example, setting this value to 3 returns the substring captured by the third set of parentheses in the regular expression.

Default: 0

Note

The subexpressions are numbered left to right, based on the appearance of opening parenthesis, so nested regular expressions . For example, in the regular expression `\s*(\w+\s+(\w+))` , subexpression 1 is the one that captures everything but any leading whitespaces.

Examples

Select the first substring of letters that end with **thy** .

```
=> SELECT REGEXP_SUBSTR('healthy, wealthy, and wise', '\w+thy');
REGEXP_SUBSTR
-----
healthy
(1 row)
```

Select the first substring of letters that ends with **thy** starting at the second character in the string.

```
=> SELECT REGEXP_SUBSTR('healthy, wealthy, and wise', '\w+thy', 2);
REGEXP_SUBSTR
-----
ealthy
(1 row)
```

Select the second substring of letters that ends with **thy** .

```
=> SELECT REGEXP_SUBSTR('healthy, wealthy, and wise', '\w+thy', 1, 2);
REGEXP_SUBSTR
-----
wealthy
(1 row)
```

Return the contents of the third captured subexpression, which captures the third word in the string.

```
=> SELECT REGEXP_SUBSTR('one two three', '(\w+)\s+(\w+)\s+(\w+)', 1, 1, ', 3');
REGEXP_SUBSTR
-----
three
(1 row)
```

Text search functions

This section contains text search functions specific to Vertica.

In this section

- [DELETE_TOKENIZER_CONFIG_FILE](#)
- [GET_TOKENIZER_PARAMETER](#)
- [READ_CONFIG_FILE](#)
- [SET_TOKENIZER_PARAMETER](#)

DELETE_TOKENIZER_CONFIG_FILE

Deletes a tokenizer configuration file.

Syntax

```
SELECT v_txtindex.DELETE_TOKENIZER_CONFIG_FILE (USING PARAMETERS proc_oid='proc_oid', confirm={true | false });
```

Parameters

confirm = [true | false]

Boolean flag. Indicates that the configuration file should be removed even if the tokenizer is still in use.

True — Force deletion of the tokenizer when the used parameter value is True.

False — Delete tokenizer if the used parameter value is False.

Default: False

proc_oid

A unique identifier assigned to a tokenizer when it is created. Users must query the system table vs_procedures to get the proc_oid for a given tokenizer name. See [Configuring a tokenizer](#) for more information.

Examples

The following example shows how you can use DELETE_TOKENIZER_CONFIG_FILE to delete the tokenizer configuration file:

```
=> SELECT v_txtindex.DELETE_TOKENIZER_CONFIG_FILE (USING PARAMETERS proc_oid='45035996274126984');
DELETE_TOKENIZER_CONFIG_FILE
```

```
-----
t
(1 row)
```

GET_TOKENIZER_PARAMETER

Returns the configuration parameter for a given tokenizer.

Syntax

```
SELECT v_txtindex.GET_TOKENIZER_PARAMETER(parameter_name USING PARAMETERS proc_oid=proc_oid);
```

Parameters

parameter_name

Name of the parameter to be returned.

One of the following:

- `stopWordsCaseInsensitive`
- `minorSeparators`
- `majorSeparators`
- `minLength`
- `maxLength`
- `ngramsSize`
- `used`

proc_oid

A unique identifier assigned to a tokenizer when it is created. Users must query the system table `vs_procedures` to get the `proc_oid` for a given tokenizer name. See [Configuring a tokenizer](#) for more information.

Examples

The following examples show how you can use `GET_TOKENIZER_PARAMETER`.

Return the stop words used in a tokenizer:

```
=> SELECT v_txtindex.GET_TOKENIZER_PARAMETER('stopwordscaseinsensitive' USING PARAMETERS proc_oid='45035996274126984');
getTokenizerParameter
-----
devil,TODAY,the,fox
(1 row)
```

Return the major separators used in a tokenizer:

```
=> SELECT v_txtindex.GET_TOKENIZER_PARAMETER('majorseparators' USING PARAMETERS proc_oid='45035996274126984');
getTokenizerParameter
-----
{}()&[]
(1 row)
```

READ_CONFIG_FILE

Reads and returns the key-value pairs of all the parameters of a given tokenizer.

You must use the `OVER()` clause with this function.

Syntax

```
SELECT v_txtindex.READ_CONFIG_FILE(USING PARAMETERS proc_oid=proc_oid) OVER ()
```

Parameters

proc_oid

A unique identifier assigned to a tokenizer when it is created. Users must query the system table `vs_procedures` to get the `proc_oid` for a given tokenizer name. See [Configuring a tokenizer](#) for more information.

Examples

The following example shows how you can use READ_CONFIG_FILE to return the parameters associated with a tokenizer:

```
=> SELECT v_txtindex.READ_CONFIG_FILE(USING PARAMETERS proc_oid='45035996274126984') OVER();
      config_key | config_value
-----+-----
majorseparators | {}()&[]
stopwordscaseinsensitive | devil,TODAY,the,fox
(2 rows)
```

SET_TOKENIZER_PARAMETER

Configures the tokenizer parameters.

Important

`\n`, `\t`, `\r` must be entered as Unicode using Vertica notation, `U&'000D'`, or using Vertica escaping notation, `E\r'`. Otherwise, they are taken literally as two separate characters. For example, `"\` & `"r"`.

Syntax

```
SELECT v_txtindex.SET_TOKENIZER_PARAMETER (parameter_name, parameter_value USING PARAMETERS proc_oid='proc_oid')
```

Parameters

parameter_name

Name of the parameter to be configured.

Use one of the following:

- **stopwordsCaseInsensitive** : List of stop words. All the tokens that belong to the list are ignored. Vertica supports separators and stop words up to the first 256 Unicode characters.
If you want to define a stop word that contains a comma or a backslash, then it needs to be escaped.
For example: `"Dear Jack\,` `"Dear Jack\\`
Default: `"` (empty list)
- **majorSeparators** :List of major separators. Enclose in quotes with no spaces between.
Default: `E' []<>(){}|!;:''* & ? + \r\n\t'`
- **minorSeparators** : List of minor separators. Enclose in quotes with no spaces between.
Default: `E'/:=@.-$#%_'`
- **minLength** — Minimum length a token can have, type Integer. Must be greater than 0.
Default: `'2'`
- **maxLength** : Maximum length a token can be. Type Integer. Cannot be greater than 1024 bytes. For information about increasing the token size, see [Text search parameters](#).
Default: `'128'`
- **ngramsSize** : Integer value greater than zero. Use only with ngram tokenizers.
Default: `'3'`
- **used** : Indicates when a tokenizer configuration cannot be changed. Type Boolean. After you set used to `True`, any calls to `setTokenizerParameter` fail.
You must set the parameter `used` to `True` before using the configured tokenizer. Doing so prevents the configuration from being modified after being used to create a text index.
Default: `False`

parameter_value

The value of a configuration parameter.

If you want to disable `minorSeparators` or `stopWordsCaseInsensitive`, then set their values to `"`.

proc_oid

A unique identifier assigned to a tokenizer when it is created. Users must query the system table `vs_procedures` to get the `proc_oid` for a given tokenizer name. See [Configuring a tokenizer](#) for more information.

Examples

The following examples show how you can use SET_TOKENIZER_PARAMETER to configure stop words and separators.

Configure the stop words of a tokenizer:

```
=> SELECT v_txtindex.SET_TOKENIZER_PARAMETER('stopwordsCaseInsensitive', 'devil,TODAY,the,fox' USING PARAMETERS
proc_oid='45035996274126984');
SET_TOKENIZER_PARAMETER
```

```
-----
t
(1 row)
```

Configure the major separators of a tokenizer:

```
=> SELECT v_txtindex.SET_TOKENIZER_PARAMETER('majorSeparators','E{ }()&[]' USING PARAMETERS proc_oid='45035996274126984');
SET_TOKENIZER_PARAMETER
```

```
-----
t
(1 row)
```

Mathematical functions

Some of these functions are provided in multiple forms with different argument types. Except where noted, any given form of a function returns the same data type as its argument. The functions working with [DOUBLE PRECISION](#) data could vary in accuracy and behavior in boundary cases depending on the host system.

In this section

- [ABS](#)

- [SIGN](#)
- [SIN](#)
- [SINH](#)
- [SQRT](#)
- [TAN](#)
- [TANH](#)
- [TRUNC](#)
- [WIDTH_BUCKET](#)

ABS

Returns the absolute value of the argument. The return value has the same data type as the argument..

Behavior type

[Immutable](#)

Syntax

```
ABS ( expression )
```

Arguments

expression

Resolves to a value of type INTEGER or DOUBLE PRECISION.

Examples

```
SELECT ABS(-28.7);
abs
-----
28.7
(1 row)
```

ACOS

Returns a DOUBLE PRECISION value representing the trigonometric inverse cosine of the argument.

Behavior type

[Immutable](#)

Syntax

```
ACOS ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
SELECT ACOS (1);
acos
-----
0
(1 row)
```

ACOSH

Returns a DOUBLE PRECISION value that represents the inverse (arc) hyperbolic cosine of the function argument.

Behavior type

[Immutable](#)

Syntax

```
ACOSH ( expression )
```

Arguments

expression

Resolves to a value of type INTEGER or DOUBLE PRECISION ≥ 1.0 , otherwise returns NaN.

Examples

```
=> SELECT acosh(4);
acosh
-----
2.06343706889556
(1 row)
```

ASIN

Returns a DOUBLE PRECISION value representing the trigonometric inverse sine of the argument.

Behavior type

[Immutable](#)

Syntax

```
ASIN ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
SELECT ASIN(1);
  asin
-----
1.5707963267949
(1 row)
```

ASINH

Returns a DOUBLE PRECISION value that represents the inverse (arc) hyperbolic sine of the function argument.

Behavior type

[Immutable](#)

Syntax

```
ASINH ( expression )
```

Arguments

expression

Resolves to a value of type INTEGER or DOUBLE PRECISION.

Examples

```
=> SELECT asinh(2.85);
  asinh
-----
1.76991385902105
(1 row)
```

ATAN

Returns a DOUBLE PRECISION value representing the trigonometric inverse tangent of the argument.

Behavior type

[Immutable](#)

Syntax

```
ATAN ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
SELECT ATAN(1);
  atan
-----
0.785398163397448
(1 row)
```

ATAN2

Returns a DOUBLE PRECISION value representing the trigonometric inverse tangent of the arithmetic dividend of the arguments.

Behavior type

[Immutable](#)

Syntax

```
ATAN2 ( quotient, divisor )
```

Arguments

quotient

Resolves to a value of type DOUBLE PRECISION representing the quotient.

divisor

Resolves to a value of type DOUBLE PRECISION representing the divisor.

Examples

```
SELECT ATAN2(2,1);
  ATAN2
-----
 1.10714871779409
(1 row)
```

ATANH

Returns a DOUBLE PRECISION value that represents the inverse hyperbolic tangent of the function argument.

Behavior type

[Immutable](#)

Syntax

```
ATANH ( expression )
```

Arguments

expression

Resolves to a value of type INTEGER or DOUBLE PRECISION between -1.0 and +1.0, inclusive, otherwise returns NaN.

Examples

```
=> SELECT atanh(-0.875);
  atanh
-----
-1.35402510055111
(1 row)
```

CBRT

Returns the cube root of the argument. The return value has the type DOUBLE PRECISION.

Behavior type

[Immutable](#)

Syntax

```
CBRT ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
SELECT CBRT(27.0);
  cbrt
-----
 3
(1 row)
```

CEILING

Rounds up the returned value up to the next whole number. For example, given arguments of 5.01 and 5.99, CEILING returns 6. CEILING is the opposite of [FLOOR](#), which rounds down the returned value.

Behavior type

[Immutable](#)

Syntax

```
CEIL[ING] ( expression )
```

Arguments

expression

Resolves to an INTEGER or DOUBLE PRECISION value.

Examples

```
=> SELECT CEIL(-42.8);
CEIL
-----
-42
(1 row)
SELECT CEIL(48.01);
CEIL
-----
49
(1 row)
```

COS

Returns a DOUBLE PRECISION value that represents the trigonometric cosine of the passed parameter.

Behavior type

[Immutable](#)

Syntax

```
COS ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
SELECT COS(-1);
COS
-----
0.54030230586814
(1 row)
```

COSH

Returns a DOUBLE PRECISION value that represents the hyperbolic cosine of the passed parameter.

Behavior type

[Immutable](#)

Syntax

```
COSH ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
=> SELECT COSH(-1);
COSH
-----
1.54308063481524
```

COT

Returns a DOUBLE PRECISION value representing the trigonometric cotangent of the argument.

Behavior type

[Immutable](#)

Syntax

```
COT ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
SELECT COT(1);
```

```
    cot
```

```
-----
```

```
0.642092615934331
```

```
(1 row)
```

DEGREES

Converts an expression from [radians](#) to fractional degrees, or from degrees, minutes, and seconds to fractional degrees. The return value has the type DOUBLE PRECISION.

Behavior type

[Immutable](#)

Syntax

```
DEGREES ( { radians | degrees, minutes, seconds } )
```

Arguments

radians

Unit of angular measure. 2π radians is equal to a full rotation.

degrees

Unit of angular measure, equal to 1/360 of a full rotation.

minutes

Unit of angular measurement, representing 1/60 of a degree.

seconds

Unit of angular measurement, representing 1/60 of a minute.

Examples

```
SELECT DEGREES(0.5);
```

```
    DEGREES
```

```
-----
```

```
28.6478897565412
```

```
(1 row)
```

```
SELECT DEGREES(1,2,3);
```

```
    DEGREES
```

```
-----
```

```
1.034166666666667
```

```
(1 row)
```

DISTANCE

Returns the distance (in kilometers) between two points. You specify the latitude and longitude of the starting point and the ending point. You can also specify the radius of curvature for greater accuracy when using an ellipsoidal model.

Behavior type

[Immutable](#)

Syntax

```
DISTANCE ( lat0, lon0, lat1, lon1 [, radius-of-curvature ] )
```

Arguments

lat0

Starting point latitude.

lon0

Starting point longitude.

lat1

Ending point latitude

lon1

Ending point longitude.

radius-of-curvature

Radius of the earth's curvature at the midpoint between the starting and ending points. This argument allows for greater accuracy when using an ellipsoidal earth model. If you omit this argument, DISTANCE uses the WGS-84 average r1 radius, about 6371.009 km.

Examples

This example finds the distance in kilometers for 1 degree of longitude at latitude 45 degrees, assuming earth is spherical.

```
SELECT DISTANCE(45,0,45,1);
DISTANCE
-----
78.6262959272162
(1 row)
```

DISTANCEV

Returns the distance (in kilometers) between two points using the Vincenty formula. Because the Vincenty formula includes the parameters of the WGS-84 ellipsoid model, you need not specify a radius of curvature. You specify the latitude and longitude of both the starting point and the ending point. This function is more accurate, but will be slower, than the DISTANCE function.

Behavior type

[Immutable](#)

Syntax

```
DISTANCEV (lat0, lon0, lat1, lon1);
```

Arguments

lat0

Specifies the latitude of the starting point.

lon0

Specifies the longitude of the starting point.

lat1

Specifies the latitude of the ending point.

lon1

Specifies the longitude of the ending point.

Examples

This example finds the distance in kilometers for 1 degree of longitude at latitude 45 degrees, assuming earth is ellipsoidal.

```
SELECT DISTANCEV(45,0, 45,1);
distanceV
-----
78.8463347095916
(1 row)
```

EXP

Returns the exponential function, e to the power of a number. The return value has the same data type as the argument.

Behavior type

[Immutable](#)

Syntax

```
EXP ( exponent )
```

Arguments

exponent

Resolves to a value of type INTEGER or DOUBLE PRECISION.

Examples

```
SELECT EXP(1.0);
```

```
exp
```

```
-----
```

```
2.71828182845905
```

```
(1 row)
```

FLOOR

Rounds down the returned value to the previous whole number. For example, given arguments of 5.01 and 5.99, FLOOR returns 5. FLOOR is the opposite of [CEILING](#), which rounds up the returned value.

Behavior type

[Immutable](#)

Syntax

```
FLOOR ( expression )
```

Arguments

expression

Resolves to an INTEGER or DOUBLE PRECISION value.

Examples

```
=> SELECT FLOOR((TIMESTAMP '2005-01-17 10:00' - TIMESTAMP '2005-01-01') / INTERVAL '7');
```

```
FLOOR
```

```
-----
```

```
2
```

```
(1 row)
```

```
=> SELECT FLOOR(-42.8);
```

```
FLOOR
```

```
-----
```

```
-43
```

```
(1 row)
```

```
=> SELECT FLOOR(42.8);
```

```
FLOOR
```

```
-----
```

```
42
```

```
(1 row)
```

Although the following example looks like an INTEGER, the number on the left is 2^{49} as an INTEGER, while the number on the right is a FLOAT:

```
=> SELECT 1<<49, FLOOR(1 << 49);
```

```
?column? | floor
```

```
-----+-----
```

```
562949953421312 | 562949953421312
```

```
(1 row)
```

Compare the previous example to:

```
=> SELECT 1<<50, FLOOR(1 << 50);
```

```
?column? | floor
```

```
-----+-----
```

```
1125899906842624 | 1.12589990684262e+15
```

```
(1 row)
```

HASH

Calculates a hash value over the function arguments, producing a value in the range $0 \leq x < 2^{63}$.

The **HASH** function is typically used to segment a projection over a set of cluster nodes. The function selects a specific node for each row based on the values of the row columns. The **HASH** function distributes data evenly across the cluster, which facilitates optimal query execution.

Behavior type

[Immutable](#)

Syntax

```
HASH ( { * | expression[,...] } )
```

Arguments

* | ***expression*** [...]

One of the following:

- * (asterisk)

Specifies to hash all columns in the queried table.

- ***expression***

An expression of any data type. Functions that are included in ***expression*** must be deterministic. If specified in a projection's [hash segmentation clause](#), each expression typically resolves to a [column reference](#).

Examples

```
=> SELECT HASH(product_price, product_cost) FROM product_dimension
   WHERE product_price = '11';
   hash
-----
4157497907121511878
1799398249227328285
3250220637492749639
(3 rows)
```

See also

[Hash segmentation clause](#)

LN

Returns the natural logarithm of the argument. The return data type is the same as the argument.

Behavior type

[Immutable](#)

Syntax

```
LN ( expression )
```

Arguments

expression

Resolves to a value of type INTEGER or DOUBLE PRECISION.

Examples

```
SELECT LN(2);
   ln
-----
0.693147180559945
(1 row)
```

LOG

Returns the logarithm to the specified base of the argument. The data type of the return value is the same data type as the passed parameter.

Behavior type

[Immutable](#)

Syntax

```
LOG ( [ base, ] expression )
```

Arguments

base

Specifies the base (default is base 10)

expression

Resolves to a value of type INTEGER or DOUBLE PRECISION.

Examples

```
=> SELECT LOG(2.0, 64);
LOG
-----
 6
(1 row)
SELECT LOG(100);
LOG
-----
 2
(1 row)
```

LOG10

Returns the base 10 logarithm of the argument, also known as the *common logarithm*. The data type of the return value is the same as the data type of the passed parameter.

Behavior type

[Immutable](#)

Syntax

```
LOG10 ( expression )
```

Arguments

expression

Resolves to a value of type INTEGER or DOUBLE PRECISION.

Examples

```
=> SELECT LOG10(30);
LOG10
-----
1.47712125471966
(1 row)
```

MOD

Returns the remainder of a division operation.

Behavior type

[Immutable](#)

Syntax

```
MOD( expression1, expression2 )
```

Arguments

expression1

Resolves to a [numeric data type](#) that specifies the dividend.

expression2

Resolves to a numeric data type that specifies the divisor.

Computation rules

When computing `MOD(expression1 , expression2)`, the following rules apply:

- If either *expression1* or *expression2* is the null value, then the result is the null value.
- If *expression2* is zero, then an exception condition is raised: data exception — division by zero.
- Otherwise, the result is the unique exact numeric value *R* with scale 0 (zero) such that all of the following are true:
 - *R* has the same sign as *expression2*.
 - The absolute value of *R* is less than the absolute value of *expression1*.
 - $expression2 = expression1 * K + R$ for some exact numeric value *K* with scale 0 (zero).

Examples

```
SELECT MOD(9,4);
```

```
mod
-----
  1
(1 row)
```

```
SELECT MOD(10,3);
```

```
mod
-----
  1
(1 row)
```

```
SELECT MOD(-10,3);
```

```
mod
-----
 -1
(1 row)
```

```
SELECT MOD(-10,-3);
```

```
mod
-----
 -1
(1 row)
```

```
SELECT MOD(10,-3);
```

```
mod
-----
  1
(1 row)
```

```
=> SELECT MOD(6,2,0);
```

```
ERROR 3117: Division by zero
```

PI

Returns the constant pi (P), the ratio of any circle's circumference to its diameter in Euclidean geometry The return type is DOUBLE PRECISION.

Behavior type

[Immutable](#)

Syntax

```
PI()
```

Examples

```
SELECT PI();
```

```
pi
-----
3.14159265358979
(1 row)
```

POWER

Returns a [DOUBLE PRECISION](#) value representing one number raised to the power of another number.

Behavior type

[Immutable](#)

Syntax

```
POW[ER] ( expression1, expression2 )
```

Arguments

expression1

Resolves to a DOUBLE PRECISION value that represents the base.

expression2

Resolves to a DOUBLE PRECISION value that represents the exponent.

Examples

```
SELECT POWER(9.0, 3.0);
power
-----
 729
(1 row)
```

RADIANS

Returns a DOUBLE PRECISION value representing an angle expressed in radians. You can express the input angle in [DEGREES](#), and optionally include minutes and seconds.

Behavior type

[Immutable](#)

Syntax

```
RADIANS (degrees [, minutes, seconds])
```

Arguments

degrees

Unit of angular measurement, representing 1/360 of a full rotation.

minutes

Unit of angular measurement, representing 1/60 of a degree.

seconds

Unit of angular measurement, representing 1/60 of a minute.

Examples

```
SELECT RADIANS(45);
RADIANS
-----
0.785398163397448
(1 row)

SELECT RADIANS (1,2,3);
RADIANS
-----
0.018049613347708
(1 row)
```

RANDOM

Returns a uniformly-distributed random [DOUBLE PRECISION](#) value x , where $0 \leq x < 1$.

Typical pseudo-random generators accept a seed, which is set to generate a reproducible pseudo-random sequence. Vertica, however, distributes SQL processing over a cluster of nodes, where each node generates its own independent random sequence.

Results depending on RANDOM are not reproducible because the work might be divided differently across nodes. Therefore, Vertica automatically generates truly random seeds for each node each time a request is executed and does not provide a mechanism for forcing a specific seed.

Behavior type

[Volatile](#)

Syntax

```
RANDOM()
```

Examples

In the following example, RANDOM returns a float ≥ 0 and < 1.0 :

```
SELECT RANDOM();
```

```
random
```

```
-----  
0.211625560652465
```

```
(1 row)
```

RANDOMINT

Accepts and returns an integer between 0 and the integer argument *expression* -1.

Typical pseudo-random generators accept a seed, which is set to generate a reproducible pseudo-random sequence. Vertica, however, distributes SQL processing over a cluster of nodes, where each node generates its own independent random sequence.

Results depending on RANDOM are not reproducible because the work might be divided differently across nodes. Therefore, Vertica automatically generates truly random seeds for each node each time a request is executed and does not provide a mechanism for forcing a specific seed.

Behavior type

[Volatile](#)

Syntax

```
RANDOMINT ( expression )
```

Arguments

expression

Resolves to a positive [INTEGER](#) between 1 and $2^{63} - 1$, inclusive. If you supply a negative value or *expression* > 1, Vertica returns an error.

Examples

In the following example, the result is an INTEGER ≥ 0 and < *expression*, randomly chosen from the set {0,1,2,3,4}.

```
=> SELECT RANDOMINT(5);
```

```
RANDOMINT
```

```
-----  
3
```

```
(1 row)
```

RANDOMINT_CRYPTO

Accepts and returns an INTEGER value from a set of values between 0 and the specified function argument -1. For this cryptographic random number generator, Vertica uses RAND_bytes to provide the random value.

Behavior type

[Volatile](#)

Syntax

```
RANDOMINT_CRYPTO ( expression )
```

Arguments

expression

Resolves to a positive integer between 1 and $2^{63} - 1$, inclusive.

Examples

In the following example, RANDOMINT_CRYPTO returns an INTEGER ≥ 0 and less than the specified argument 5, randomly chosen from the set {0,1,2,3,4}.

```
=> SELECT RANDOMINT_crypto(5);
```

```
RANDOMINT_crypto
```

```
-----  
3
```

```
(1 row)
```

ROUND

Rounds a value to a specified number of decimal places, retaining the original precision and scale. Fractions greater than or equal to .5 are rounded up. Fractions less than .5 are rounded down (truncated).

Behavior type

[Immutable](#)

Syntax

```
ROUND ( expression [, places ] )
```

Arguments

expression

Resolves to a value of type **NUMERIC** or **DOUBLE PRECISION (FLOAT)** .

places

An **INTEGER** value. When *places* is a positive integer, Vertica rounds the value to the right of the decimal point using the specified number of places. When *places* is a negative integer, Vertica rounds the value on the left side of the decimal point using the specified number of places.

Notes

Using **ROUND** with a **NUMERIC** datatype returns **NUMERIC** , retaining the original precision and scale.

```
=> SELECT ROUND(3.5);
ROUND
-----
 4.0
(1 row)
```

Examples

```
=> SELECT ROUND(2.0, 1.0) FROM dual;
ROUND
-----
 2.0
(1 row)
=> SELECT ROUND(12.345, 2.0);
ROUND
-----
12.350
(1 row)
=> SELECT ROUND(3.4444444444444444);
ROUND
-----
3.0000000000000000
(1 row)
=> SELECT ROUND(3.14159, 3);
ROUND
-----
 3.14200
(1 row)
=> SELECT ROUND(1234567, -3);
ROUND
-----
1235000
(1 row)
=> SELECT ROUND(3.4999, -1);
ROUND
-----
 0.0000
(1 row)
```

The following example creates a table with two columns, adds one row of values, and shows sample rounding to the left and right of a decimal point.

```
=> CREATE TABLE samplround (roundcol1 NUMERIC, roundcol2 NUMERIC);
```

```
CREATE TABLE
```

```
=> INSERT INTO samplround VALUES (1234567, .1234567);
```

```
OUTPUT
```

```
-----  
1  
(1 row)
```

```
=> SELECT ROUND(roundcol1,-3) AS pn3, ROUND(roundcol1,-4) AS pn4, ROUND(roundcol1,-5) AS pn5 FROM samplround;
```

```
pn3 | pn4 | pn5  
-----+-----+-----  
1235000.0000000000000000 | 1230000.0000000000000000 | 1200000.0000000000000000  
(1 row)
```

```
=> SELECT ROUND(roundcol2,3) AS p3, ROUND(roundcol2,4) AS p4, ROUND(roundcol2,5) AS p5 FROM samplround;
```

```
p3 | p4 | p5  
-----+-----+-----  
0.1230000000000000 | 0.1235000000000000 | 0.1234600000000000  
(1 row)
```

SIGN

Returns a DOUBLE PRECISION value of -1, 0, or 1 representing the arithmetic sign of the argument.

Behavior type

[Immutable](#)

Syntax

```
SIGN ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
SELECT SIGN(-8.4);
```

```
sign  
-----  
-1  
(1 row)
```

SIN

Returns a DOUBLE PRECISION value that represents the trigonometric sine of the passed parameter.

Behavior type

[Immutable](#)

Syntax

```
SIN ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
SELECT SIN(30 * 2 * 3.14159 / 360);
```

```
SIN  
-----  
0.499999616987256  
(1 row)
```

SINH
Returns a DOUBLE PRECISION value that represents the hyperbolic sine of the passed parameter.

Behavior type

[Immutable](#)

Syntax

```
SINH ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
=> SELECT SINH(30 * 2 * 3.14159 / 360);
```

```
    SINH
```

```
-----  
0.547852969600632
```

SQRT

Returns a DOUBLE PRECISION value representing the arithmetic square root of the argument.

Behavior type

[Immutable](#)

Syntax

```
SQRT ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
SELECT SQRT(2);
```

```
    sqrt
```

```
-----  
1.4142135623731
```

```
(1 row)
```

TAN

Returns a DOUBLE PRECISION value that represents the trigonometric tangent of the passed parameter.

Behavior type

[Immutable](#)

Syntax

```
TAN ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
=> SELECT TAN(30);
```

```
    TAN
```

```
-----  
-6.40533119664628
```

```
(1 row)
```

TANH

Returns a DOUBLE PRECISION value that represents the hyperbolic tangent of the passed parameter.

Behavior type

[Immutable](#)

Syntax

```
TANH ( expression )
```

Arguments

expression

Resolves to a value of type DOUBLE PRECISION.

Examples

```
=> SELECT TANH(-1);
      TANH
-----
-0.761594155955765
```

TRUNC

Returns the *expression* value fully truncated (toward zero). Supplying a *places* argument truncates the expression to the number of decimal places you indicate.

Behavior type

[Immutable](#)

Syntax

```
TRUNC ( expression [, places ] )
```

Arguments

expression

Resolves to a value of type **NUMERIC** or **DOUBLE PRECISION (FLOAT)** .

places

INTEGER value:

- Positive: Vertica truncates the value to the right of the decimal point.
- Negative: Vertica truncates the value on the left side of the decimal point.

Notes

Using **TRUNC** with a **NUMERIC** datatype returns **NUMERIC** , retaining the original precision and scale.

```
=> SELECT TRUNC(3.5);
      TRUNC
-----
      3.0
(1 row)
```

Examples

```
=> SELECT TRUNC(42.8);
      TRUNC
-----
      42.0
(1 row)
=> SELECT TRUNC(42.4382, 2);
      TRUNC
-----
      42.4300
(1 row)
```

The following example creates a table with two columns, adds one row of values, and shows sample truncating to the left and right of a decimal point.

```
=> CREATE TABLE sampletrunc (truncol1 NUMERIC, truncol2 NUMERIC);
```

```
CREATE TABLE
```

```
=> INSERT INTO sampletrunc VALUES (1234567, .1234567);
```

```
OUTPUT
```

```
-----  
 1  
(1 row)  
  
=> SELECT TRUNC(truncol1,-3) AS p3, TRUNC(truncol1,-4) AS p4, TRUNC(truncol1,-5) AS p5 FROM sampletrunc;
```

```
      p3      |      p4      |      p5  
-----+-----+-----  
1234000.0000000000000000 | 1230000.0000000000000000 | 1200000.0000000000000000  
(1 row)
```

```
=> SELECT TRUNC(truncol2,3) AS p3, TRUNC(truncol2,4) AS p4, TRUNC(truncol2,5) AS p5 FROM sampletrunc;
```

```
      p3      |      p4      |      p5  
-----+-----+-----  
0.123000000000000000 | 0.123400000000000000 | 0.123450000000000000  
(1 row)
```

WIDTH_BUCKET

Constructs equiwidth histograms, in which the histogram range is divided into intervals (buckets) of identical sizes. In addition, values below the low bucket return 0, and values above the high bucket return *bucket-count* + 1. Returns an integer value.

Behavior type

[Immutable](#)

Syntax

```
WIDTH_BUCKET ( expression, hist-min, hist-max, bucket-count )
```

Arguments

expression

The expression for which the histogram is created. This expression must resolve to a numeric or datetime value or a value that can be implicitly converted to a numeric or datetime value. If *expression* evaluates to null, then the *expression* returns null.

hist-min

Resolves to the low boundary of *bucket-count*, a non-null numeric or datetime value.

hist-max

Resolves to the high boundary of *bucket-count*, a non-null numeric or datetime value.

bucket-count

Resolves to an INTEGER constant that indicates the number of buckets.

Notes

- WIDTH_BUCKET divides a data set into buckets of equal width. For example, Age = 0–20, 20–40, 40–60, 60–80. This is known as an equiwidth histogram.
- When using WIDTH_BUCKET pay attention to the minimum and maximum boundary values. Each bucket contains values equal to or greater than the base value of that bucket, so that age ranges of 0–20, 20–40, and so on, are actually 0–19.99 and 20–39.999.
- WIDTH_BUCKET accepts the following data types: (FLOAT and/or INTEGER), (TIMESTAMP and/or DATE and/or TIMESTAMPTZ), or (INTERVAL and/or TIME).

Examples

The following example returns five possible values and has three buckets: 0 [Up to 100), 1 [100–300), 2 [300–500), 3 [500–700), and 4 [700 and up):

```
SELECT product_description, product_cost, WIDTH_BUCKET(product_cost, 100, 700, 3);
```

The following example creates a nine-bucket histogram on the annual_income column for customers in Connecticut who are female doctors. The results return the bucket number to an *income* column, divided into eleven buckets, including an underflow and an overflow. Note that if customers had annual incomes greater than the maximum value, they would be assigned to an overflow bucket, 10:

```
SELECT customer_name, annual_income, WIDTH_BUCKET (annual_income, 100000, 1000000, 9) AS "Income"
FROM public.customer_dimension WHERE customer_state='CT'
AND title='Dr.' AND customer_gender='Female' AND household_id < '1000'
ORDER BY "Income";
```

In the following result set, the reason there is a bucket 0 is because buckets are numbered from 1 to `bucket_count` . Anything less than the given value of `hist_min` goes in bucket 0, and anything greater than the given value of `hist_max` goes in the bucket `bucket_count+1` . In this example, bucket 9 is empty, and there is no overflow. The value 12,283 is less than 100,000, so it goes into the underflow bucket.

customer_name	annual_income	Income
Joanna A. Nguyen	12283	0
Amy I. Nguyen	109806	1
Juanita L. Taylor	219002	2
Carla E. Brown	240872	2
Kim U. Overstreet	284011	2
Tiffany N. Reyes	323213	3
Rebecca V. Martin	324493	3
Betty . Roy	476055	4
Midori B. Young	462587	4
Martha T. Brown	687810	6
Julie D. Miller	616509	6

NULL-handling functions

NULL-handling functions take arguments of any type, and their return type is based on their argument types.

In this section

- [COALESCE](#)
- [IFNULL](#)
- [ISNULL](#)
- [NULLIF](#)
- [NULLIFZERO](#)
- [NVL](#)
- [NVL2](#)
- [ZEROIFNULL](#)

COALESCE

Returns the value of the first non-null expression in the list. If all expressions evaluate to null, then `COALESCE` returns null.

`COALESCE` conforms to the ANSI SQL-92 standard.

Behavior type

[Immutable](#)

Syntax

```
COALESCE ( { * | expression[,...] } )
```

Arguments

* | `expression` [...]

One of the following:

- `*` (asterisk)
Evaluates all columns in the queried table.
- `expression`
An expression of any data type. Functions that are included in `expression` must be deterministic.

Examples

COALESCE returns the first non-null value in each row that is queried from table `lead_vocalists` . Note that in the first row, COALESCE returns an empty string.

```
=> SELECT quote_nullable(fname)fname, quote_nullable(lname)lname,
       quote_nullable(coalesce (fname, lname)) "1st non-null value" FROM lead_vocalists ORDER BY fname;
fname | lname | 1st non-null value
-----+-----+-----
"     | 'Sting' | "
'Diana' | 'Ross' | 'Diana'
'Grace' | 'Slick' | 'Grace'
'Mick' | 'Jagger' | 'Mick'
'Steve' | 'Winwood' | 'Steve'
NULL | 'Cher' | 'Cher'
(6 rows)
```

See also

- [CASE expressions](#)
- [ISNULL](#)

IFNULL

Returns the value of the first non-null expression in the list.

IFNULL is an alias of [NVL](#).

Behavior type

[Immutable](#)

Syntax

```
IFNULL ( expression1 , expression2 );
```

Parameters

- If * *expression1* *is null, then IFNULL returns *expression2*.
- If * *expression1* *is not null, then IFNULL returns *expression1*.

Notes

- [COALESCE](#) is the more standard, more general function.
- IFNULL is equivalent to ISNULL.
- IFNULL is equivalent to COALESCE except that IFNULL is called with only two arguments.
- [ISNULL\(a,b\)](#) is different from *x IS NULL* .
- The arguments can have any data type supported by Vertica.
- Implementation is equivalent to the CASE expression. For example:

```
CASE WHEN expression1 IS NULL THEN expression2
ELSE expression1 END;
```

- The following statement returns the value 140:

```
SELECT IFNULL(NULL, 140) FROM employee_dimension;
```

- The following statement returns the value 60:

```
SELECT IFNULL(60, 90) FROM employee_dimension;
```

Examples

```
=> SELECT IFNULL (SCORE, 0.0) FROM TESTING;
IFNULL
-----
100.0
87.0
.0
.0
.0
(5 rows)
```

See also

- [CASE expressions](#)
- [COALESCE](#)
- [NVL](#)
- [ISNULL](#)

ISNULL

Returns the value of the first non-null expression in the list.

ISNULL is an alias of [NVL](#).

Behavior type

[Immutable](#)

Syntax

```
ISNULL ( expression1 , expression2 );
```

Parameters

- If * *expression1* *is null, then ISNULL returns *expression2*.
- If * *expression1* *is not null, then ISNULL returns *expression1*.

Notes

- [COALESCE](#) is the more standard, more general function.
- ISNULL is equivalent to COALESCE except that ISNULL is called with only two arguments.
- [ISNULL\(a,b\)](#) is different from [x IS NULL](#) .
- The arguments can have any data type supported by Vertica.
- Implementation is equivalent to the CASE expression. For example:

```
CASE WHEN expression1 IS NULL THEN expression2
ELSE expression1 END;
```

- The following statement returns the value 140:

```
SELECT ISNULL(NULL, 140) FROM employee_dimension;
```

- The following statement returns the value 60:

```
SELECT ISNULL(60, 90) FROM employee_dimension;
```

Examples

```
SELECT product_description, product_price,
ISNULL(product_cost, 0.0) AS cost
FROM product_dimension;
```

product_description	product_price	cost
Brand #59957 wheat bread	405	207
Brand #59052 blueberry muffins	211	140
Brand #59004 english muffins	399	240
Brand #53222 wheat bread	323	94
Brand #52951 croissants	367	121
Brand #50658 croissants	100	94
Brand #49398 white bread	318	25
Brand #46099 wheat bread	242	3
Brand #45283 wheat bread	111	105
Brand #43503 jelly donuts	259	19

- [CASE expressions](#)
- [COALESCE](#)
- [NVL](#)

NULLIF

Compares two expressions. If the expressions are not equal, the function returns the first expression (expression1). If the expressions are equal, the function returns null.

Behavior type

[Immutable](#)

Syntax

```
NULLIF( expression1, expression2 )
```

Parameters

expression1

Is a value of any data type.

expression2

Must have the same data type as * *expr1* * or a type that can be implicitly cast to match *expression1* . The result has the same type as *expression1* .

Examples

The following series of statements illustrates one simple use of the NULLIF function.

Creates a single-column table *t* and insert some values :

```
CREATE TABLE t (x TIMESTAMPTZ);
INSERT INTO t VALUES('2009-09-04 09:14:00-04');
INSERT INTO t VALUES('2010-09-04 09:14:00-04');
```

Issue a select statement:

```
SELECT x, NULLIF(x, '2009-09-04 09:14:00 EDT') FROM t;
   x      | nullif
-----+-----
2009-09-04 09:14:00-04 |
2010-09-04 09:14:00-04 | 2010-09-04 09:14:00-04
SELECT NULLIF(1, 2);
NULLIF
-----
1
(1 row)
SELECT NULLIF(1, 1);
NULLIF
-----
(1 row)
SELECT NULLIF(20.45, 50.80);
NULLIF
-----
20.45
(1 row)
```

NULLIFZERO

Evaluates to NULL if the value in the column is 0.

Syntax

```
NULLIFZERO(expression)
```

Parameters

expression

(INTEGER, DOUBLE PRECISION, INTERVAL, or NUMERIC) Is the string to evaluate for 0 values.

Examples

The TESTING table below shows the test scores for 5 students. Note that test scores are missing for S. Robinson and K. Johnson (NULL values appear in the Score column.)

```
=> SELECT * FROM TESTING;
```

```
  Name | Score
-----+-----
J. Doe | 100
R. Smith | 87
L. White | 0
S. Robinson |
K. Johnson |
(5 rows)
```

The SELECT statement below specifies that Vertica should return any 0 values in the Score column as Null. In the results, you can see that Vertica returns L. White's 0 score as Null.

```
=> SELECT Name, NULLIFZERO(Score) FROM TESTING;
```

```
  Name | NULLIFZERO
-----+-----
J. Doe | 100
R. Smith | 87
L. White |
S. Robinson |
K. Johnson |
(5 rows)
```

NVL

Returns the value of the first non-null expression in the list.

Behavior type

[Immutable](#)

Syntax

```
NVL ( expression1 , expression2 );
```

Parameters

- If * *expression1* *is null, then NVL returns *expression2*.
- If * *expression1* *is not null, then NVL returns *expression1*.

Notes

- [COALESCE](#) is the more standard, more general function.
- NVL is equivalent to COALESCE except that NVL is called with only two arguments.
- The arguments can have any data type supported by Vertica.
- Implementation is equivalent to the CASE expression:

```
CASE WHEN expression1 IS NULL THEN expression2
ELSE expression1 END;
```

Examples

expression1 is not null, so NVL returns *expression1*:

```
SELECT NVL('fast', 'database');
```

```
nvl
-----
fast
(1 row)
```

expression1 is null, so NVL returns *expression2*:

```
SELECT NVL(null, 'database');
```

```
nvl
-----
database
(1 row)
```

expression2 is null, so NVL returns *expression1*:

```
SELECT NVL('fast', null);
```

```
nvl  
-----  
fast  
(1 row)
```

In the following example, expression1 (title) contains nulls, so NVL returns expression2 and substitutes 'Withheld' for the unknown values:

```
SELECT customer_name, NVL(title, 'Withheld') as title  
FROM customer_dimension  
ORDER BY title;
```

```
customer_name | title  
-----+-----  
Alexander I. Lang | Dr.  
Steve S. Harris | Dr.  
Daniel R. King | Dr.  
Luigi I. Sanchez | Dr.  
Duncan U. Carcetti | Dr.  
Meghan K. Li | Dr.  
Laura B. Perkins | Dr.  
Samantha V. Robinson | Dr.  
Joseph P. Wilson | Mr.  
Kevin R. Miller | Mr.  
Lauren D. Nguyen | Mrs.  
Emily E. Goldberg | Mrs.  
Darlene K. Harris | Ms.  
Meghan J. Farmer | Ms.  
Bettercare | Withheld  
Ameristar | Withheld  
Initech | Withheld  
(17 rows)
```

See also

- [CASE expressions](#)
- [COALESCE](#)
- [ISNULL](#)
- [NVL2](#)

NVL2

Takes three arguments. If the first argument is not NULL, it returns the second argument, otherwise it returns the third argument. The data types of the second and third arguments are implicitly cast to a common type if they don't agree, similar to [COALESCE](#).

Behavior type

[Immutable](#)

Syntax

```
NVL2 ( expression1 , expression2 , expression3 );
```

Parameters

- If *expression1* is not null, then NVL2 returns *expression2* .
- If *expression1* is null, then NVL2 returns *expression3* .

Notes

Arguments two and three can have any data type supported by Vertica.

Implementation is equivalent to the CASE expression:

```
CASE WHEN expression1 IS NOT NULL THEN expression2 ELSE expression3 END;
```

Examples

In this example, expression1 is not null, so NVL2 returns expression2:

```
SELECT NVL2('very', 'fast', 'database');
nvl2
-----
fast
(1 row)
```

In this example, expression1 is null, so NVL2 returns expression3:

```
SELECT NVL2(null, 'fast', 'database');
nvl2
-----
database
(1 row)
```

In the following example, expression1 (title) contains nulls, so NVL2 returns expression3 ('Withheld') and also substitutes the non-null values with the expression 'Known':

```
SELECT customer_name, NVL2(title, 'Known', 'Withheld')
as title
FROM customer_dimension
ORDER BY title;
 customer_name | title
-----+-----

(17 rows)
```

See also

- [CASE expressions](#)
- [COALESCE](#)
- [COALESCE](#)

ZEROIFNULL

Evaluates to 0 if the column is NULL.

Syntax

```
ZEROIFNULL(expression)
```

Parameters

expression

String to evaluate for NULL values, one of the following data types:

- INTEGER
- DOUBLE PRECISION
- INTERVAL
- NUMERIC

Examples

The following query returns scores for five students from table `test_results` , where `Score` is set to 0 for L. White, and null for S. Robinson and K. Johnson:

```
=> SELECT Name, Score FROM test_results;
  Name  | Score
-----+-----
J. Doe  | 100
R. Smith | 87
L. White | 0
S. Robinson |
K. Johnson |
(5 rows)
```

The next query invokes `ZEROIFNULL` on column `Score` , so Vertica returns 0 for for S. Robinson and K. Johnson:

```
=> SELECT Name, ZEROIFNULL (Score) FROM test_results;
  Name  | ZEROIFNULL
-----+-----
J. Doe  | 100
R. Smith | 87
L. White | 0
S. Robinson | 0
K. Johnson | 0
(5 rows)
```

You can also use `ZEROIFNULL` in [PARTITION BY expressions](#) , which must always resolve to a non-null value. For example:

```
CREATE TABLE t1 (a int, b int) PARTITION BY (ZEROIFNULL(a));
CREATE TABLE
```

Vertica invokes this function when it partitions table `t1` , typically during a load operation. During the load, the function checks the data of the `PARTITION BY` expression—in this case, column `a` —for null values. If encounters a null value in a given row, it sets the partition key to 0, instead of returning with an error.

Performance analysis functions

The functions in this section support profiling and analyzing database and query performance.

In this section

- [Profiling functions](#)
- [Statistics management functions](#)
- [Workload management functions](#)

Profiling functions

This section contains profiling functions specific to Vertica.

In this section

- [CLEAR_PROFILING](#)
- [DISABLE_PROFILING](#)
- [ENABLE_PROFILING](#)
- [SHOW_PROFILING_CONFIG](#)

CLEAR_PROFILING

Clears from memory data for the specified profiling type.

Note

Vertica stores profiled data in memory, so profiling can be memory intensive depending on how much data you collect.

This is a meta-function. You must call meta-functions in a top-level `SELECT` statement.

Behavior type

[Volatile](#)

Syntax

```
CLEAR_PROFILING( 'profiling-type' [, 'scope'] )
```

Parameters

profiling-type

The type of profiling data to clear:

- **session** : Clear profiling for basic session parameters and lock time out data.
- **query** : Clear profiling for general information about queries that ran, such as the query strings used and the duration of queries.
- **ee** : Clear profiling for information about the execution run of each query.

scope

Specifies at what scope to clear profiling on the specified data, one of the following:

- **local** : Clear profiling data for the current session.
- **global** : Clear profiling data across all database sessions.

Examples

The following statement clears profiled data for queries:

```
=> SELECT CLEAR_PROFILING('query');
```

See also

- [DISABLE_PROFILING](#)
- [ENABLE_PROFILING](#)
- [SHOW_PROFILING_CONFIG](#)
- [Profiling database performance](#)

DISABLE_PROFILING

Disables for the current session collection of profiling data of the specified type. For detailed information, see [Enabling profiling](#).

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
DISABLE_PROFILING( 'profiling-type' )
```

Parameters

profiling-type

The type of profiling data to disable:

- **session** : Disables profiling for basic session parameters and lock time out data.
- **query** : Disables profiling for general information about queries that ran, such as the query strings used and the duration of queries.
- **ee** : Disables profiling for information about the execution run of each query.

Examples

The following statement disables profiling on query execution runs:

```
=> SELECT DISABLE_PROFILING('ee');
DISABLE_PROFILING
-----
EE Profiling Disabled
(1 row)
```

See also

- [CLEAR_PROFILING](#)
- [ENABLE_PROFILING](#)
- [SHOW_PROFILING_CONFIG](#)

ENABLE_PROFILING

Enables collection of profiling data of the specified type for the current session. For detailed information, see [Enabling profiling](#).

Note

Vertica stores session and query profiling data in memory, so profiling can be memory intensive, depending on how much data you collect.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
ENABLE_PROFILING( 'profiling-type' )
```

Parameters

profiling-type

The type of profiling data to enable:

- **session** : Enable profiling for basic session parameters and lock time out data.
- **query** : Enable profiling for general information about queries that ran, such as the query strings used and the duration of queries.
- **ee** : Enable profiling for information about the execution run of each query.

Examples

The following statement enables profiling on query execution runs:

```
=> SELECT ENABLE_PROFILING('ee');
      ENABLE_PROFILING
```

```
-----
EE Profiling Enabled
(1 row)
```

See also

- [CLEAR_PROFILING](#)
- [DISABLE_PROFILING](#)
- [SHOW_PROFILING_CONFIG](#)

SHOW_PROFILING_CONFIG

Shows whether profiling is enabled.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Stable](#)

Syntax

```
SHOW_PROFILING_CONFIG ()
```

Examples

The following statement shows that profiling is enabled globally for all profiling types (session, execution engine, and query):

```
=> SELECT SHOW_PROFILING_CONFIG();
      SHOW_PROFILING_CONFIG
```

```
-----
Session Profiling: Session off, Global on
EE Profiling:      Session off, Global on
Query Profiling:  Session off, Global on
(1 row)
```

See also

- [CLEAR_PROFILING](#)
- [DISABLE_PROFILING](#)
- [ENABLE_PROFILING](#)
- [Profiling database performance](#)

Statistics management functions

This section contains Vertica functions for collecting and managing table data statistics.

In this section

- [ANALYZE_EXTERNAL_ROW_COUNT](#)
- [ANALYZE_STATISTICS](#)
- [ANALYZE_STATISTICS_PARTITION](#)
- [DROP_EXTERNAL_ROW_COUNT](#)
- [DROP_STATISTICS](#)
- [DROP_STATISTICS_PARTITION](#)
- [EXPORT_STATISTICS](#)
- [EXPORT_STATISTICS_PARTITION](#)
- [IMPORT_STATISTICS](#)
- [VALIDATE_STATISTICS](#)

ANALYZE_EXTERNAL_ROW_COUNT

Calculates the exact number of rows in an external table. [ANALYZE_EXTERNAL_ROW_COUNT](#) runs in the background.

Note

You cannot calculate row counts on external tables with [DO_TM_TASK](#).

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
ANALYZE_EXTERNAL_ROW_COUNT ('[[[database.]schema.]table-name ]')
```

Parameters

[**database .**] **schema**

Database and [schema](#) . The default schema is [public](#) . If you specify a database, it must be the current database.

table-name

Specifies the name of the external table for which to calculate the exact row count. If you supply an empty string, Vertica calculate the exact number of rows for all external tables.

Privileges

Any INSERT/UPDATE/DELETE privilege on the external table

Examples

Calculate the exact row count for all external tables:

```
=> SELECT ANALYZE_EXTERNAL_ROW_COUNT('');
```

Calculate the exact row count for table [loader_rejects](#) :

```
=> SELECT ANALYZE_EXTERNAL_ROW_COUNT('loader_rejects');
```

See also

- [Collecting database statistics](#)
- [DROP_EXTERNAL_ROW_COUNT](#)

ANALYZE_STATISTICS

Collects and aggregates data samples and storage information from all nodes that store projections associated with the specified table. The function skips columns of [complex data types](#) . You can set the scope of the collection at several levels:

- Database
- Table

- Table column

By default, Vertica analyzes multiple columns in a single-query execution plan, depending on resource limits. This multi-column analysis reduces plan execution latency and speeds up analysis of relatively small tables with many columns.

Vertica writes statistics to the database catalog. The query optimizer uses this collected data to create query plans. Without this data, the query optimizer assumes uniform distribution of data values and equal storage usage for all projections.

You can cancel statistics collection with CTRL+C or by calling [INTERRUPT_STATEMENT](#).

ANALYZE_STATISTICS is an alias of the function ANALYZE_HISTOGRAM, which is no longer documented.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
ANALYZE_STATISTICS ('[[[database.]schema.]table]' [, 'column-list' [, percent ]])
```

Returns

0—Success

If an error occurs, refer to [vertica.log](#) for details.

Arguments

[[database .] schema]. table

Table on which to collect data. If set to an empty string, Vertica collects statistics for all database tables and their projections. The default schema is [public](#). If you specify a database, it must be the current database.

column-list

Comma-delimited list of columns in *table*, typically predicate columns. Vertica narrows the scope of the data collection to the specified columns. Columns of complex types are not supported.

If you alter a table to add a column and populate its contents with either default or other values, call ANALYZE_STATISTICS on this column to get the most current statistics.

percent

Percentage of data to read from disk (not the amount to analyze), a float between 0 and 100. The default value is 10.

Analyzing a higher percentage takes proportionally longer to process, but produces a higher level of sampling accuracy.

Privileges

Non-superuser:

- Schema: USAGE
- Table: One of INSERT, DELETE, or UPDATE

Restrictions

- Vertica supports ANALYZE_STATISTICS on [local and global temporary tables](#). In both cases, you can obtain statistics only on tables that are created with the option [ON COMMIT PRESERVE ROWS](#). Otherwise, Vertica deletes table content when committing the current transaction, so no table data is available for analysis.
- Vertica collects no statistics from the following projections:
 - Live aggregate and Top-K projections
 - Projections that are defined to include a SQL function within an expression
- Vertica collects no statistics on columns of [ARRAY](#), [SET](#), or [ROW](#) types.

Examples

See [Collecting table statistics](#).

See also

[ANALYZE_STATISTICS_PARTITION](#)

ANALYZE_STATISTICS_PARTITION

Collects and aggregates data samples and storage information for a range of partitions in the specified table. Vertica writes the collected statistics to the database catalog.

You can cancel statistics collection with CTRL+C or meta-function [INTERRUPT_STATEMENT](#).

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
ANALYZE_STATISTICS_PARTITION ('[[database.]schema.]table', 'min-range-value', 'max-range-value' [, 'column-list' [, percent ]])
```

Returns

0: Success

If an error occurs, refer to [vertica.log](#) for details.

Parameters

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

table

Table on which to collect data.

min-range-value

max-range-value

Minimum and maximum value of partition keys to analyze, where *min-range-value* must be \leq *max-range-value*. To analyze one partition, *min-range-value* and *max-range-value* must be equal.

column-list

Comma-delimited list of columns in *table*, typically a predicate column. Vertica narrows the scope of the data collection to the specified columns.

percent

Float value between 0 and 100 that specifies what percentage of data to read from disk (not the amount of data to analyze). If you omit this argument, Vertica sets the percentage to 10.

Analyzing more than 10 percent disk space takes proportionally longer to process, but produces a higher level of sampling accuracy.

Privileges

Non-superuser:

- Schema: USAGE
- Table: One of INSERT, DELETE, or UPDATE

Requirements and restrictions

The following requirements and restrictions apply to ANALYZE_STATISTICS_PARTITION:

- The table must be partitioned and cannot contain unpartitioned data.
- The table partition expression must specify a single column. The following expressions are supported:
 - Expressions that specify only the column—that is, partition on all column values. For example:

```
PARTITION BY ship_date GROUP BY CALENDAR_HIERARCHY_DAY(ship_date, 2, 2)
```
 - If the column is a [DATE](#) or [TIMESTAMP/TIMESTAMPZ](#), the partition expression can specify a [supported date/time function](#) that returns that column or any portion of it, such as month or year. For example, the following partition expression specifies to partition on the year portion of column *order_date*:

```
PARTITION BY YEAR(order_date)
```
 - Expressions that perform addition or subtraction on the column. For example:

```
PARTITION BY YEAR(order_date) -1
```
- The table partition expression cannot coerce the specified column to another data type.
- Vertica collects no statistics from the following projections:
 - Live aggregate and Top-K projections
 - Projections that are defined to include an SQL function within an expression

Examples

See [Collecting partition statistics](#).

DROP_EXTERNAL_ROW_COUNT

Removes external table row count statistics compiled by [ANALYZE_EXTERNAL_ROW_COUNT](#). [DROP_EXTERNAL_ROW_COUNT](#) runs in the background.

Caution

Statistics can be time consuming to regenerate.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
DROP_EXTERNAL_ROW_COUNT ('[[[database.]schema.]table-name ]');
```

Parameters

schema

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

table-name

The external table for which to remove the exact row count. If you specify an empty string, Vertica drops the exact row count statistic for all external tables.

Privileges

- INSERT/UPDATE/DELETE privilege on table
- USAGE privilege on schema that contains the table

Examples

Drop row count statistics for external table [loader_rejects](#) :

```
=> SELECT DROP_EXTERNAL_ROW_COUNT('loader_rejects');
```

See also

[Collecting database statistics](#)

[DROP_STATISTICS](#)

Removes statistical data on database projections previously generated by [ANALYZE_STATISTICS](#). When you drop this data, the Vertica optimizer creates query plans using default statistics.

Caution

Regenerating statistics can incur significant overhead.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
DROP_STATISTICS ('[[[database.]schema.]table]' [, 'category' [, '[column-list]']])
```

Parameters

[[database](#) .] [schema](#)

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

table

Table on which to drop statistics. If set to an empty string, Vertica drops statistics for all database tables and their projections.

category

Category of statistics to drop, one of the following:

- [ALL](#) (default): Drop all statistics, including histograms and row counts.
- [HISTOGRAMS](#) : Drop only histograms. Row count statistics remain.

column-list

Comma-delimited list of columns in *table* , typically predicate columns. Vertica narrows the scope of dropped statistics to the specified columns. If you omit this parameter or supply an empty string, Vertica drops statistics on all columns.

Privileges

Non-superuser:

- Schema: USAGE
- Table: One of INSERT, DELETE, or UPDATE

Examples

Drop all base statistics for the table `store.store_sales_fact` :

```
=> SELECT DROP_STATISTICS('store.store_sales_fact');
DROP_STATISTICS
-----
          0
(1 row)
```

Drop statistics for all table projections:

```
=> SELECT DROP_STATISTICS ("");
DROP_STATISTICS
-----
          0
(1 row)
```

See also

[DROP_STATISTICS_PARTITION](#)

`DROP_STATISTICS_PARTITION`

Removes statistical data on database projections previously generated by [ANALYZE_STATISTICS_PARTITION](#) . When you drop this data, the Vertica optimizer creates query plans using table-level statistics, if available, or default statistics.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
DROP_STATISTICS_PARTITION ('[[database.]schema.]table', '[min-range-value]', '[max-range-value]' [, category [, '[column-list]'] ] )
```

Parameters

[*database* .] *schema*

Database and [schema](#) . The default schema is `public` . If you specify a database, it must be the current database.

table

Table on which to drop statistics.

min-range-value max-range-value

The minimum and maximum value of partition keys on which to drop statistics, where *min-range-value* must be \leq *max-range-value* . If you supply empty strings for both parameters, Vertica drops all partition-level statistics for this table or the specified columns.

Important

The range of keys to drop must be equal to, or a superset of, the full range of partitions previously analyzed by [ANALYZE_STATISTICS_PARTITION](#) . If the range omits any analyzed partition, [DROP_STATISTICS_PARTITION](#) drops no statistics.

category

The category of statistics to drop, one of the following:

- `BASE` (default): Drop histograms and row counts (min/max column values, histogram).
- `HISTOGRAMS` : Drop only histograms. Row count statistics remain.
- `ALL` : Drop all statistics.

column-list

A comma-delimited list of columns in *table* , typically predicate columns. Vertica narrows the scope of dropped statistics to the specified

columns. If you omit this parameter or supply an empty string, Vertica drops statistics on all columns.

Privileges

Non-superuser:

- Schema: USAGE
- Table: One of INSERT, DELETE, or UPDATE

See also

[DROP_STATISTICS](#)

[EXPORT_STATISTICS](#)

Generates statistics in XML format from data previously collected by [ANALYZE_STATISTICS](#). Before you export statistics, collect the latest data by calling [ANALYZE_STATISTICS](#).

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Stable](#)

Syntax

```
EXPORT_STATISTICS ('[ filename ]' [, 'table-spec' [, 'column[,...]']])
```

Arguments

filename

Specifies where to write the generated XML. If *filename* already exists, EXPORT_STATISTICS overwrites it. If you supply an empty string, EXPORT_STATISTICS writes the XML to standard output.

table-spec

Specifies the table on which to export projection statistics:

```
[[database.]schema.]table
```

The default schema is `public`. If you specify a database, it must be the current database.

If *table-spec* is omitted or set to an empty string, Vertica exports all statistics for the database.

column

The name of a column in *table-spec*, typically a predicate column. You can specify multiple comma-delimited columns. Vertica narrows the scope of exported statistics to the specified columns.

Privileges

Superuser

Restrictions

EXPORT_STATISTICS does not export statistics for LONG data type columns.

Examples

The following statement exports statistics on the VMart example database to a file:

```
=> SELECT EXPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/vmart_stats.xml');
EXPORT_STATISTICS
```

```
-----
Statistics exported successfully
(1 row)
```

The next statement exports statistics on a single column (price) from a table named food:

```
=> SELECT EXPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/price.xml', 'food.price');
EXPORT_STATISTICS
```

```
-----
Statistics exported successfully
(1 row)
```

See also

- [EXPORT_STATISTICS_PARTITION](#)

- [DROP_STATISTICS](#)
- [IMPORT_STATISTICS](#)
- [VALIDATE_STATISTICS](#)
- [Collecting database statistics](#)
- [Best practices for statistics collection](#)

EXPORT_STATISTICS_PARTITION

Generates partition-level statistics in XML format from data previously collected by [ANALYZE_STATISTICS_PARTITION](#).

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Stable](#)

Syntax

```
EXPORT_STATISTICS_PARTITION ([ 'filename' ], 'table-spec', 'min-range-value', 'max-range-value' [, 'column[,...]'] )
```

Arguments

filename

Specifies where to write the generated XML. If *filename* already exists, EXPORT_STATISTICS_PARTITION overwrites it. If you supply an empty string, the function writes to standard output.

table-spec

Specifies the table on which to export partition statistics:

```
[[database.]schema.]table
```

The default schema is `public`. If you specify a database, it must be the current database.

min-range-value , **max-range-value**

The minimum and maximum value of partition keys on which to export statistics, where *min-range-value* must be \leq *max-range-value*.

Important

The range of keys to export must be equal to, or a superset of, the full range of partitions previously analyzed by ANALYZE_STATISTICS_PARTITION. If the range omits any analyzed partition, EXPORT_STATISTICS_PARTITION exports no statistics.

column

The name of a column in *table*, typically a predicate column. You can specify multiple comma-delimited columns. Vertica narrows the scope of exported statistics to the specified columns.

Privileges

Superuser

Restrictions

EXPORT_STATISTICS_PARTITION does not export statistics for LONG data type columns.

See also

[EXPORT_STATISTICS](#)

IMPORT_STATISTICS

Imports statistics from the XML file that was generated by [EXPORT_STATISTICS](#). Imported statistics override existing statistics for the projections that are referenced in the XML file.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Stable](#)

Syntax

```
IMPORT_STATISTICS ( 'filename' )
```

Parameters

filename

The path and name of an XML input file that was generated by [EXPORT_STATISTICS](#).

Privileges

Superuser

Restrictions

- **IMPORT_STATISTICS** imports only valid statistics. If the source XML file has invalid statistics for a specific column, those statistics are not imported and Vertica throws a warning. If the statistics file has an invalid structure, the import operation fails. To check a statistics file for validity, run [VALIDATE_STATISTICS](#).
- **IMPORT_STATISTICS** returns warnings for LONG data type columns, as the source XML file generated by **EXPORT_STATISTICS** contains no statistics for columns of that type.

Examples

Import the statistics for the VMart database from an XML file previously created by **EXPORT_STATISTICS** :

```
=> SELECT IMPORT_STATISTICS('/opt/vertica/examples/VMart_Schema/vmart_stats.xml');
      IMPORT_STATISTICS
-----
Importing statistics for projection date_dimension_super column date_key failure (stats did not contain row counts)
Importing statistics for projection date_dimension_super column date failure (stats did not contain row counts)
Importing statistics for projection date_dimension_super column full_date_description failure (stats did not contain row counts)
...
(1 row)
```

See also

- [ANALYZE_STATISTICS](#)
- [EXPORT_STATISTICS](#)

VALIDATE_STATISTICS

Validates statistics in the XML file generated by [EXPORT_STATISTICS](#).

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Stable](#)

Syntax

```
VALIDATE_STATISTICS ( 'XML-file' )
```

Parameters

XML-file

the path and name of the XML file that contains the statistics to validate.

Privileges

Superuser

Reporting valid statistics

The following example shows the results when the statistics are valid:

```
=> SELECT EXPORT_STATISTICS('cust_dim_stats.xml','customer_dimension');
      EXPORT_STATISTICS
-----
Statistics exported successfully
(1 row)

=> SELECT VALIDATE_STATISTICS('cust_dim_stats.xml');
      VALIDATE_STATISTICS
-----
(1 row)
```

Identifying invalid statistics

If **VALIDATE_STATISTICS** is unable to read a document's XML, it throws this error:

```
=> SELECT VALIDATE_STATISTICS('/home/dbadmin/stats.xml');
      VALIDATE_STATISTICS
```

```
-----
Error validating statistics file: At line 1:1. Invalid document structure
(1 row)
```

If some table statistics are invalid, [VALIDATE_STATISTICS](#) returns a report that identifies them. In the following example, the function reports that attributes [distinct](#) , [buckets](#) , [rows](#) , [count](#) , and [distinctCount](#) cannot be negative numbers.

```
=> SELECT VALIDATE_STATISTICS('/stats.xml');
WARNING 0: Invalid value '-1' for attribute 'distinct' under column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'buckets' under column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'rows' under column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'count' under bound '1', column 'public.t.x'.
  Please use a positive value.
WARNING 0: Invalid value '-1' for attribute 'distinctCount' under bound '1', column 'public.t.x'.
  Please use a positive value.
VALIDATE_STATISTICS
-----
(1 row)
```

In this case, run [ANALYZE_STATISTICS](#) on the table again to create valid statistics.

See also

- [ANALYZE_STATISTICS](#)
- [EXPORT_STATISTICS](#)

Workload management functions

This section contains workload management functions specific to Vertica.

In this section

- [ANALYZE_WORKLOAD](#)
- [CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY](#)
- [CHANGE_RUNTIME_PRIORITY](#)
- [MOVE_STATEMENT_TO_RESOURCE_POOL](#)
- [SLEEP](#)

ANALYZE_WORKLOAD

Runs Workload Analyzer, a utility that analyzes system information held in [system tables](#).

Workload Analyzer intelligently monitors the performance of SQL queries and workload history, resources, and configurations to identify the root causes for poor query performance. [ANALYZE_WORKLOAD](#) returns tuning recommendations for all events within the scope and time that you specify, from system table [TUNING_RECOMMENDATIONS](#).

Tuning recommendations are based on a combination of [statistics](#), system and [data collector](#) events, and database-table-projection design. Workload Analyzer recommendations can help you quickly and easily tune query performance.

See [Workload analyzer recommendations](#) for the common triggering conditions and recommendations.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
ANALYZE_WORKLOAD ( '[ scope ]' [, 'since-time' | save-data ] );
```

Parameters

scope

Specifies the catalog objects to analyze, as follows:

```
[[database.]schema.]table
```

If set to an empty string, Vertica returns recommendations for all database objects.
If you specify a database, it must be the current database.

since-time

Specifies the start time for the analysis time span, which continues up to the current system status, inclusive. If you omit this parameter, **ANALYZE_WORKLOAD** returns recommendations on events since the last time you called this function.

Note

You must explicitly cast strings to **TIMESTAMP** or **TIMESTAMPZ**. For example:

```
SELECT ANALYZE_WORKLOAD('T1', '2010-10-04 11:18:15'::TIMESTAMPZ);  
SELECT ANALYZE_WORKLOAD('T1', TIMESTAMPZ '2010-10-04 11:18:15');
```

save-data

Specifies whether to save returned values from **ANALYZE_WORKLOAD** :

- **false** (default): Results are discarded.
- **true** : Saves the results returned by **ANALYZE_WORKLOAD** . Subsequent calls to **ANALYZE_WORKLOAD** return results that start from the last invocation when results were saved. Object events preceding that invocation are ignored.

Return values

Returns aggregated tuning recommendations from [TUNING_RECOMMENDATIONS](#) .

Privileges

Superuser

Examples

See [Getting tuning recommendations](#) .

See also

- [Analyzing workloads](#)
- [Workload analyzer recommendations](#)

CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY

Changes the run-time priority of an active query.

Note

This function replaces deprecated function **CHANGE_RUNTIME_PRIORITY** .

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY(transaction-id, 'value')
```

Parameters

transaction-id

Identifies the transaction, obtained from the system table [SESSIONS](#) .

value

The **RUNTIMEPRIORITY** value: **HIGH** , **MEDIUM** , or **LOW** .

Privileges

- **Superuser** : None

- Non-superusers can only change the runtime priority of their own queries, and cannot raise the runtime priority of a query to a level higher than that of the resource pool.

Examples

See [Changing runtime priority of a running query](#).

CHANGE_RUNTIME_PRIORITY

Changes the run-time priority of a query that is actively running. Note that, while this function is still valid, you should instead use [CHANGE_CURRENT_STATEMENT_RUNTIME_PRIORITY](#) to change run-time priority. [CHANGE_RUNTIME_PRIORITY](#) will be deprecated in a future release of Vertica.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
CHANGE_RUNTIME_PRIORITY(TRANSACTION_ID, STATEMENT_ID, 'value')
```

Parameters

TRANSACTION_ID

An identifier for the transaction within the session.

[TRANSACTION_ID](#) cannot be NULL.

You can find the transaction ID in the Sessions table.

STATEMENT_ID

A unique numeric ID assigned by the Vertica catalog, which identifies the currently executing statement.

You can find the statement ID in the Sessions table.

You can specify NULL to change the run-time priority of the currently running query within the transaction.

'value'

The [RUNTIMEPRIORITY](#) value. Can be HIGH, MEDIUM, or LOW.

Privileges

No special privileges required. However, non-superusers can change the run-time priority of their own queries only. In addition, non-superusers can never raise the run-time priority of a query to a level higher than that of the resource pool.

Examples

```
=> SELECT CHANGE_RUNTIME_PRIORITY(45035996273705748, NULL, 'low');
```

MOVE_STATEMENT_TO_RESOURCE_POOL

Attempts to move the specified query to the specified target pool.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
MOVE_STATEMENT_TO_RESOURCE_POOL (session_id , transaction_id, statement_id, target_resource_pool_name)
```

Parameters

session_id

Identifier for the session where the query you want to move is currently executing.

transaction_id

Identifier for the transaction within the session.

statement_id

Unique numeric ID for the statement you want to move.

target_resource_pool_name

Name of the existing resource pool to which you want to move the specified query.

Outputs

The function may return the following results:

```
MOV_REPLAN: Target pool does not have sufficient resources. See v_monitor.resource_pool_move for details. Vertica will attempt to replan the statement on target pool.
```

```
MOV_REPLAN: Target pool has priority HOLD. Vertica will attempt to replan the statement on target pool.
```

```
MOV_FAILED: Statement not found.
```

```
MOV_NO_OP: Statement already on target pool.
```

```
MOV_REPLAN: Statement is in queue. Vertica will attempt to replan the statement on target pool.
```

```
MOV_SUCC: Statement successfully moved to target pool.
```

Privileges

Superuser

Examples

The following example shows how you can move a specific statement to a resource pool called my_target_pool:

```
=> SELECT MOVE_STATEMENT_TO_RESOURCE_POOL ('v_vmart_node0001.example.-31427:0x82fbm', 45035996273711993, 1, 'my_target_pool');
```

See also:

- [Manually moving queries to different resource pools](#)
- [RESOURCE_POOL_MOVE](#)

SLEEP

Waits a specified number of seconds before executing another statement or command.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
SLEEP( seconds )
```

Parameters

seconds

The wait time, specified in one or more seconds (0 or higher) expressed as a positive integer. Single quotes are optional; for example, **SLEEP(3)** is the same as **SLEEP('3')**.

Notes

- This function returns value 0 when successful; otherwise it returns an error message due to syntax errors.
- You cannot cancel a sleep operation.
- Be cautious when using SLEEP() in an environment with shared resources, such as in combination with transactions that take exclusive locks.

Examples

The following command suspends execution for 100 seconds:

```
=> SELECT SLEEP(100);
sleep
-----
0
(1 row)
```

Stored procedure functions

This section contains functions for managing [stored procedures](#).

In this section

- [ACTIVE_SCHEDULER_NODE](#)
- [ENABLE_SCHEDULE](#)
- [ENABLE_TRIGGER](#)
- [EXECUTE_TRIGGER](#)

ACTIVE_SCHEDULER_NODE

Returns the [active scheduler node](#). A [schedule](#) must be associated with a [trigger](#) to be enabled.

To view existing schedules, see [USER_SCHEDULES](#).

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
ACTIVE_SCHEDULER_NODE()
```

Privileges

Superuser

Examples

To return the active scheduler node:

```
=> SELECT active_scheduler_node();

active_scheduler_node
-----
initiator
(1 row)
```

ENABLE_SCHEDULE

Enables or disables a schedule. A schedule can only be enabled if a trigger is attached to it.

To view existing schedules, see [USER_SCHEDULES](#).

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
ENABLE_SCHEDULE ( '[[database.]schema.]schedule', enabled )
```

Arguments

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#) . If you specify a database, it must be the current database.

schedule

The schedule to enable or disable.

enabled

Boolean, whether to enable the trigger.

Privileges

Superuser

Examples

To enable a schedule:

```
=> SELECT enable_schedule('vmart.management.daily_1am', true);
```

To disable a schedule:

```
=> SELECT enable_schedule('vmart.management.daily_1am', false);
```

If you leave the database and schema empty, the default is *current_database* .public:

```
=> SELECT enable_schedule('biannual_22_noon_gmt', true);
```

ENABLE_TRIGGER

Enables or disables a trigger.

To view existing triggers, see [STORED_PROC_TRIGGERS](#).

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
ENABLE_TRIGGER ( '[[database.]schema.]trigger', enabled )
```

Arguments

[*database* .] *schema*

Database and [schema](#). The default schema is *public* . If you specify a database, it must be the current database.

trigger

The trigger to enable or disable.

enabled

Boolean, whether to enable the trigger.

Privileges

Superuser

Examples

To enable a trigger:

```
=> SELECT enable_trigger('vmart.management.log_user_actions', true);
```

To disable a trigger:

```
=> SELECT enable_trigger('vmart.management.log_user_actions', false);
```

If you leave the database and schema empty, the default is *current_database* .public:

```
=> SELECT enable_trigger('revoke_log_privileges', true);
```

EXECUTE_TRIGGER

Manually executes the stored procedure attached to a trigger. This is generally used for testing the trigger.

To view existing triggers, see [STORED_PROC_TRIGGERS](#).

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Syntax

```
EXECUTE_TRIGGER ( '[[database.]schema.]trigger' )
```

Arguments

[*database* .] *schema*

Database and [schema](#). The default schema is *public* . If you specify a database, it must be the current database.

trigger

The trigger to execute.

Privileges

Superuser

Examples

To execute a trigger:

```
=> SELECT execute_trigger('vmart.management.log_user_actions');
```

If you leave the database and schema empty, the default is *current_database* .public:

```
=> SELECT execute_trigger('revoke_log_privileges');
```

System information functions

These functions provide information about the current system state. A superuser has unrestricted access to all system information, but users can view only information about their own, current sessions.

In this section

- [CURRENT_DATABASE](#)
- [CURRENT_LOAD_SOURCE](#)
- [CURRENT_SCHEMA](#)
- [CURRENT_SESSION](#)
- [CURRENT_TRANS_ID](#)
- [CURRENT_USER](#)
- [DBNAME](#) (function)
- [HAS_TABLE_PRIVILEGE](#)
- [LIST_ENABLED_CIPHERS](#)
- [SESSION_USER](#)
- [USER](#)
- [USERNAME](#)
- [VERSION](#)

CURRENT_DATABASE

Returns the name of the current database, equivalent to [DBNAME](#).

Behavior type

[Stable](#)

Syntax

Note

Parentheses are optional.

```
CURRENT_DATABASE()
```

Examples

```
=> SELECT CURRENT_DATABASE;  
CURRENT_DATABASE
```

```
-----  
VMart  
(1 row)
```

CURRENT_LOAD_SOURCE

When called within the scope of a [COPY](#) statement, returns the file name used for the load. With an optional integer argument, it returns the Nth / - delimited path part.

If the function is called outside of the context of a [COPY](#) statement, it returns NULL.

If the current load uses a UDSOURCE function that does not set the URI, CURRENT_LOAD_SOURCE returns the string **UNKNOWN** . You cannot call CURRENT_LOAD_SOURCE(INT) when using a UDSOURCE.

Behavior type

[Stable](#)

Syntax

```
CURRENT_LOAD_SOURCE( [ position ])
```

Arguments

position (positive INTEGER)

Path element to return instead of returning the full path. Elements are separated by slashes (/) and the first element is position 1. If the value is greater than the number of elements, the function returns an error. You cannot use this argument with a UDSource function.

Examples

The following load statement populates a column with the name of the file the row was loaded from:

```
-> CREATE TABLE t (c1 integer, c2 varchar(50), c3 varchar(200));
CREATE TABLE

-> COPY t (c1, c2, c3 AS CURRENT_LOAD_SOURCE())
  FROM '/home/load_file_1' ON exampledb_node02,
       '/home/load_file_2' ON exampledb_node03 DELIMITER ',';
Rows Loaded
-----
5
(1 row)

-> SELECT * FROM t;
c1 | c2 | c3
-----+-----+-----
2 | dogs | /home/load_file_1
1 | cats | /home/load_file_1
4 | superheroes | /home/load_file_2
3 | birds | /home/load_file_1
5 | whales | /home/load_file_2
(5 rows)
```

The following example reads year and month columns out of a path:

```
-> COPY reviews
  (review_id, stars,
   year AS CURRENT_LOAD_SOURCE(3)::INT,
   month AS CURRENT_LOAD_SOURCE(4)::INT)
FROM '/data/reviews/**/*.json' PARSER FJSONPARSER();
```

CURRENT_SCHEMA

Returns the name of the current schema.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Stable](#)

Syntax

```
CURRENT_SCHEMA()
```

Note

You can call this function without parentheses.

Privileges

None

Examples

The following command returns the name of the current schema:

```
=> SELECT CURRENT_SCHEMA();
current_schema
-----
public
(1 row)
```

The following command returns the same results without the parentheses:

```
=> SELECT CURRENT_SCHEMA;
current_schema
-----
public
(1 row)
```

The following command shows the current schema, listed after the [current user](#), in the search path:

```
=> SHOW SEARCH_PATH;
 name |          setting
-----+-----
search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```

See also

- [SET SEARCH_PATH](#)

CURRENT_SESSION

Returns the ID of the current client session.

Many [system tables](#) have a SESSION_ID column. You can use the CURRENT_SESSION function in queries of these tables.

Behavior type

[Stable](#)

Syntax

```
CURRENT_SESSION()
```

Examples

Each new session has a new session ID:

```
$ vsql
Welcome to vsql, the Vertica Analytic Database interactive terminal.
```

```
=> SELECT CURRENT_SESSION();
CURRENT_SESSION
-----
initiator-24897:0x1f7
(1 row)
=> \q
```

```
$ vsql
Welcome to vsql, the Vertica Analytic Database interactive terminal.
```

```
=> SELECT CURRENT_SESSION();
CURRENT_SESSION
-----
initiator-24897:0x200
(1 row)
```

CURRENT_TRANS_ID

Returns the ID of the transaction currently in progress.

Many [system tables](#) have a TRANSACTION_ID column. You can use the CURRENT_TRANS_ID function in queries of these tables.

Behavior type

[Stable](#)

Syntax

```
CURRENT_TRANS_ID()
```

Examples

Even a new session has a transaction ID:

```
$ vsql
Welcome to vsql, the Vertica Analytic Database interactive terminal.
=> SELECT CURRENT_TRANS_ID();
current_trans_id
-----
45035996273705927
(1 row)
```

This function can be used in queries of certain system tables. In the following example, a load operation is in progress:

```
=> SELECT key, SUM(num_instances) FROM v_monitor.UDX_EVENTS
WHERE event_type = 'UNMATCHED_KEY'
AND transaction_id=CURRENT_TRANS_ID()
GROUP BY key;
key          | SUM
-----+-----
chain        | 1
menu.elements.calories | 7
(2 rows)
```

CURRENT_USER

Returns a VARCHAR containing the name of the user who initiated the current database connection.

Behavior type

[Stable](#)

Syntax

```
CURRENT_USER()
```

Notes

- The CURRENT_USER function does not require parentheses.
- This function is useful for permission checking.
- CURRENT_USER is equivalent to [SESSION_USER](#), [USER](#), and [USERNAME](#).

Examples

```
=> SELECT CURRENT_USER();
CURRENT_USER
-----
dbadmin
(1 row)
```

The following command returns the same results without the parentheses:

```
=> SELECT CURRENT_USER;
CURRENT_USER
-----
dbadmin
(1 row)
```

DBNAME (function)

Returns the name of the current database, equivalent to [CURRENT_DATABASE](#).

Behavior type

[Immutable](#)

Syntax

```
DBNAME()
```

Examples

```
=> SELECT DBNAME();
  dbname
-----
VMart
(1 row)
```

HAS_TABLE_PRIVILEGE

Returns true or false to verify whether a user has the specified privilege on a table.

This is a meta-function. You must call meta-functions in a top-level [SELECT](#) statement.

Behavior type

[Volatile](#)

Behavior type

[Stable](#)

Syntax

```
HAS_TABLE_PRIVILEGE ( [ user, ] '[[database.]schema.]table', 'privilege' )
```

Parameters

user

Name or OID of a database user. If omitted, Vertica checks privileges for the current user.

[*database .*] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

table

Name or OID of the table to check.

privilege

A [table privilege](#), one of the following:

- SELECT: [Query](#) tables. SELECT privileges are granted by default to the PUBLIC role.
- INSERT: Insert table rows with [INSERT](#), and load data with [COPY](#).

Note

[COPY FROM STDIN](#) is allowed for users with INSERT privileges, while [COPY FROM file](#) requires admin privileges.

- UPDATE: [Update](#) table rows.
- DELETE: [Delete](#) table rows.
- REFERENCES: Create [foreign key constraints](#) on this table. This privilege must be set on both referencing and referenced tables.
- TRUNCATE: [Truncate](#) table contents. Non-owners of tables can also execute the following partition operations on them:
 - [DROP_PARTITIONS](#)
 - [SWAP_PARTITIONS_BETWEEN_TABLES](#)
 - [MOVE_PARTITIONS_TO_TABLE](#)
- ALTER: Modify a table's DDL with [ALTER TABLE](#).
- DROP: [Drop a table](#).

Privileges

Non-superuser, one of the following:

- Table owner
- USAGE privilege on the table schema and one or more privileges on the table

Examples

```

=> SELECT HAS_TABLE_PRIVILEGE('store.store_dimension', 'SELECT');
HAS_TABLE_PRIVILEGE
-----
t
(1 row)

=> SELECT HAS_TABLE_PRIVILEGE('release', 'store.store_dimension', 'INSERT');
HAS_TABLE_PRIVILEGE
-----
t
(1 row)

=> SELECT HAS_TABLE_PRIVILEGE(45035996273711159, 45035996273711160, 'select');
HAS_TABLE_PRIVILEGE
-----
t
(1 row)

```

LIST_ENABLED_CIPHERS

Returns a list of enabled cipher suites, which are sets of algorithms used to secure TLS/SSL connections.

By default, Vertica uses OpenSSL's default cipher suites. For more information, see the [OpenSSL man page](#).

Syntax

```
LIST_ENABLED_CIPHERS()
```

Examples

```

=> SELECT LIST_ENABLED_CIPHERS();
SSL_RSA_WITH_RC4_128_MD5
SSL_RSA_WITH_RC4_128_SHA
TLS_RSA_WITH_AES_128_CBC_SHA

```

See also

- [TLS protocol](#)
- [Security parameters](#)

SESSION_USER

Returns a VARCHAR containing the name of the user who initiated the current database session.

Behavior type

[Stable](#)

Syntax

```
SESSION_USER()
```

Notes

- The SESSION_USER function does not require parentheses.
- SESSION_USER is equivalent to [CURRENT_USER](#), [USER](#), and [USERNAME](#).

Examples

```

=> SELECT SESSION_USER();
session_user
-----
dbadmin
(1 row)

```

The following command returns the same results without the parentheses:

```
=> SELECT SESSION_USER;
```

```
session_user
```

```
-----
```

```
dbadmin
```

```
(1 row)
```

USER

Returns a VARCHAR containing the name of the user who initiated the current database connection.

Behavior type

[Stable](#)

Syntax

```
USER()
```

Notes

- The USER function does not require parentheses.
- USER is equivalent to [CURRENT_USER](#), [SESSION_USER](#), and [USERNAME](#).

Examples

```
=> SELECT USER();
```

```
current_user
```

```
-----
```

```
dbadmin
```

```
(1 row)
```

The following command returns the same results without the parentheses:

```
=> SELECT USER;
```

```
current_user
```

```
-----
```

```
dbadmin
```

```
(1 row)
```

USERNAME

Returns a VARCHAR containing the name of the user who initiated the current database connection.

Behavior type

[Stable](#)

Syntax

```
USERNAME()
```

Notes

- This function is useful for permission checking.
- USERNAME is equivalent to [CURRENT_USER](#), [SESSION_USER](#) and [USER](#).

Examples

```
=> SELECT USERNAME();
```

```
username
```

```
-----
```

```
dbadmin
```

```
(1 row)
```

VERSION

Returns a VARCHAR containing a Vertica node's version information.

Behavior type

[Stable](#)

Syntax

```
VERSION()
```

Note

The parentheses are required.

Examples

```
=> SELECT VERSION();  
      VERSION
```

Vertica Analytic Database v10.0.0-0

(1 row)

Statements

The primary structure of a SQL query is its statement. Whether a statement stands on its own, or is part of a multi-statement query, each statement must end with a semicolon. The following example contains four common SQL statements—CREATE TABLE, INSERT, SELECT, and COMMIT:

```
=> CREATE TABLE comments (id INT, comment VARCHAR);
```

```
CREATE TABLE
```

```
=> INSERT INTO comments VALUES (1, 'Hello World');
```

```
OUTPUT
```

```
-----
```

```
1
```

```
(1 row)
```

```
=> SELECT * FROM comments;
```

```
id | comment
```

```
-----+-----
```

```
1 | Hello World
```

```
(1 row)
```

```
=> COMMIT;
```

```
COMMIT
```

```
=>
```

- [UPDATE](#)

ACTIVATE DIRECTED QUERY

Activates a directed query and makes it available to the query optimizer across all sessions.

Syntax

```
ACTIVATE DIRECTED QUERY { query-name | where-clause }
```

Arguments

query-name

Name of the directed query to activate, as stored in the [DIRECTED_QUERIES](#) column *query_name*. You can also use [GET DIRECTED QUERY](#) to obtain names of all directed queries that map to an input query.

where-clause

Resolves to one or more directed queries that are filtered from system table [DIRECTED_QUERIES](#). For example, the following statement activates all directed queries with the same *save_plans_version* identifier:

```
=> ACTIVATE DIRECTED QUERY WHERE save_plans_version = 21;
```

Privileges

[Superuser](#)

Activation life cycle

After you activate a directed query, it remains active until it is explicitly deactivated by [DEACTIVATE DIRECTED QUERY](#) or removed from storage by [DROP DIRECTED QUERY](#). If a directed query is active at the time of database shutdown, Vertica automatically reactivates it when you restart the database.

Examples

See [Managing directed queries](#).

ALTER statements

ALTER statements let you change existing database objects.

In this section

- [ALTER ACCESS POLICY](#)
- [ALTER AUTHENTICATION](#)
- [ALTER CA BUNDLE](#)
- [ALTER DATA LOADER](#)
- [ALTER DATABASE](#)
- [ALTER FAULT GROUP](#)

- [ALTER TRIGGER](#)
- [ALTER USER](#)
- [ALTER VIEW](#)

ALTER ACCESS POLICY

Performs one of the following actions on existing access policies:

- Modify an access policy by changing its expression, and by enabling/disabling the policy.
- Copy an access policy from one table to another.

Syntax

Modify policy:

```
ALTER ACCESS POLICY ON [[database.]schema.]table
{ FOR COLUMN column [ expression ] | FOR ROWS [ WHERE expression ] } { GRANT TRUSTED } { ENABLE | DISABLE }
```

Copy policy:

```
ALTER ACCESS POLICY ON [[database.]schema.]table
{ FOR COLUMN column | FOR ROWS } COPY TO TABLE table;
```

Parameters

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

table

The name of the table that contains the access policy you want to enable, disable, or copy.

FOR COLUMN *column* [*expression*]

Replaces the access policy expression that was previously set for this column. Omit *expression* from the **FOR COLUMN** clause in order to enable or disable this policy only, or copy it to another table.

FOR ROWS [WHERE *expression*]

Replaces the row access policy expression that was previously set for this table. Omit **WHERE *expression*** from the **FOR ROWS** clause in order to enable or disable this policy only, or copy it to another table.

GRANT TRUSTED

Specifies that GRANT statements take precedence over the access policy in determining whether users can perform DML operations on the target table. If omitted, users can only modify table data if the access policy allows them to see the stored data in its original, unaltered state. For more information, see [Access policies and DML operations](#).

Important

GRANT TRUSTED only affects DML operations and does not enable users to see data that the access policy would otherwise mask. Specifying this option may allow users with certain grants to update data that they cannot see.

ENABLE | DISABLE

Indicates whether to enable or disable the access policy at the table level.

COPY TO TABLE *tablename*

Copies the existing access policy to the specified table. The copied access policy includes its enabled/disabled and GRANT TRUSTED statuses.

The following requirements apply:

- Copying a column access policy:
 - The target table must have a column of the same name and compatible data type.
 - The target column must not have an access policy.
- Copying a row access policy: The target table must not have an access policy.

Privileges

Modify access policy

Non-superuser: Ownership of the table

Copy access policy

Non-superuser: Ownership of the source and destination tables

Examples

See [Managing access policies](#)

See also

[CREATE ACCESS POLICY](#)

ALTER AUTHENTICATION

Modifies the settings for a specified authentication method.

Syntax

```
ALTER AUTHENTICATION auth_record {  
  | { ENABLE | DISABLE }  
  | { LOCAL | HOST [ { TLS | NO TLS } ] host_ip_address }  
  | RENAME TO new_auth_record_name  
  | METHOD value  
  | SET param=value[,...]  
  | PRIORITY value  
  | [ [ NO ] FALLTHROUGH ]  
}
```

Parameters

Parameter Name	Description
<i>auth_record</i>	Name of the authentication method to alter. Type: VARCHAR
ENABLE DISABLE	Enable or disable the specified authentication method. Default: Enabled When you perform an upgrade and use Kerberos authentication, you must manually set the authentication to ENABLE as it is disabled by default.

LOCAL HOST [{ TLS NO TLS } <i>host_ip_address</i>	Specify that the authentication method applies to local or remote (HOST) connections. For authentication methods that use LDAP, specify whether or not LDAP uses Transport Layer Security (TLS). For remote (HOST) connections, you must specify the IP address of the host from which the user or application is connecting, VARCHAR. Vertica supports IPv4 and IPv6 addresses.
RENAME TO <i>new_auth_record_name</i>	Rename the authentication record. Type: VARCHAR
METHOD <i>value</i>	The authentication method you are altering.
SET <i>param = value</i>	Set a parameter name and value for the authentication method that you are creating. This is required for LDAP , Ident , and OAuth authentication methods.
PRIORITY <i>value</i>	If the user is associated with multiple authentication methods, the priority value specifies which authentication method Vertica tries first. Default: 0 Type: INTEGER Greater values indicate higher priorities. For example, a priority of 10 is higher than a priority of 5; priority 0 is the lowest possible value. For details, see Authentication record priority .
[[NO] FALLTHROUGH]	Specifies whether to enable authentication fallthrough. For details, see Client authentication .

Privileges

Superuser

Examples

Enabling and Disabling Authentication Methods

This example uses ALTER AUTHENTICATION to disable the **v_ldap** authentication method and then enable it again:

```
=> ALTER AUTHENTICATION v_ldap DISABLE;
=> ALTER AUTHENTICATION v_ldap ENABLE;
```

Renaming Authentication Methods

This example renames the **v_kerberos** authentication method to **K5** . All users who have been granted the **v_kerberos** authentication method now have the **K5** method granted instead.

```
=> ALTER AUTHENTICATION v_kerberos RENAME TO K5;
```

Modifying Authentication Parameters

This example sets the system user for **ident1** authentication to **user1** :

```
=> CREATE AUTHENTICATION ident1 METHOD 'ident' LOCAL;
=> ALTER AUTHENTICATION ident1 SET system_users='user1';
```

When you set or modify LDAP or Ident parameters using ALTER AUTHENTICATION, Vertica validates them.

This example changes the IP address and specifies the parameters for an LDAP authentication method named **Ldap1** . Specify the bind parameters for the LDAP server. Vertica connects to the LDAP server, which authenticates the database client. If authentication succeeds, Vertica authenticates any users who have been associated with (granted) the **Ldap1** authentication method on the designated LDAP server:

```
=> CREATE AUTHENTICATION Ldap1 METHOD 'ldap' HOST '172.16.65.196';
```

```
=> ALTER AUTHENTICATION Ldap1 SET host='ldap://172.16.65.177',  
binddn_prefix='cn=', binddn_suffix=',dc=qa_domain,dc=com';
```

The next example specifies the parameters for an LDAP authentication method named `Ldap2`. Specify the LDAP search and bind parameters. Sometimes, Vertica does not have enough information to create the distinguished name (DN) for a user attempting to authenticate. In such cases, you must specify to use LDAP search and bind:

```
=> CREATE AUTHENTICATION Ldap2 METHOD 'ldap' HOST '172.16.65.196';  
=> ALTER AUTHENTICATION Ldap2 SET basedn='dc=qa_domain,dc=com',  
binddn='cn=Manager,dc=qa_domain,  
dc=com',search_attribute='cn',bind_password='secret';
```

Changing the Authentication Method

This example changes the `localpwd` authentication from hash to trust:

```
=> CREATE AUTHENTICATION localpwd METHOD 'hash' LOCAL;  
=> ALTER AUTHENTICATION localpwd METHOD 'trust';
```

Set Multiple Realms

This example sets another realm for the authentication method `krb_local`:

```
=> ALTER AUTHENTICATION krb_local set realm = 'COMPANY.COM';
```

ALTER CA BUNDLE

Deprecated

CA bundles are only usable with certain deprecated parameters in [Kafka notifiers](#). You should prefer using [TLS configurations](#) and the `TLS CONFIGURATION` parameter for notifiers instead.

Adds and removes certificates from or changes the owner of a certificate authority (CA) bundle.

Syntax

```
ALTER CA BUNDLE name  
[ADD CERTIFICATES ca_cert[, ca_cert[, ...]]  
[REMOVE CERTIFICATES ca_cert[, ca_cert[, ...]]  
[OWNER TO user]
```

Parameters

name

The name of the CA bundle.

ca_cert

The name of the CA certificate to add or remove from the bundle.

user

The name of a database user.

Privileges

Ownership of the CA bundle.

Examples

See [Managing CA bundles](#).

See also

- [CREATE CA BUNDLE](#)
- [DROP CA BUNDLE](#)

ALTER DATA LOADER

Changes the properties of a data loader created with [CREATE DATA LOADER](#).

You cannot use ALTER DATA LOADER to add, remove, or modify a [trigger](#).

Syntax

```
ALTER DATA LOADER [schema.]name {  
  SET TO copy-statement  
  | RETRY LIMIT { NONE | DEFAULT | limit }  
  | RETENTION INTERVAL monitoring-retention  
  | RENAME TO new-name  
  | OWNER TO user  
  | ENABLE | DISABLE  
}
```

Arguments

schema

Schema containing the data loader. The default schema is [public](#).

name

Name of the data loader to alter.

SET TO *copy-statement*

The new COPY statement that the loader executes. The FROM clause typically uses a glob.

RETRY LIMIT { NONE | DEFAULT | *limit* }

Maximum number of times to retry a failing file. Each time the data loader is executed, it attempts to load all files that have not yet been successfully loaded, up to this per-file limit. If set to DEFAULT, at load time the loader uses the value of the [DataLoaderDefaultRetryLimit](#) configuration parameter.

Default: [DEFAULT](#)

RETENTION INTERVAL *monitoring-retention*

How long to keep records in the events table. [DATA_LOADER_EVENTS](#) records events for all data loaders, but each data loader has its own retention interval.

Default: [14 days](#)

RENAME TO *new-name*

New name for the data loader.

OWNER TO *user*

New owner for the data loader.

ENABLE | DISABLE

Whether the data loader can be executed. Calling [EXECUTE DATA LOADER](#) on a disabled data loader returns an error. When created, data loaders with triggers are disabled by default; all others are enabled by default. If a data loader has a trigger, you must disable it before dropping it.

Privileges

Non-superuser:

- USAGE on the schema.
- Owner or ALTER privilege on the data loader.

See also

- [Automatic load](#)
- [CREATE DATA LOADER](#)
- [EXECUTE DATA LOADER](#)
- [DROP DATA LOADER](#)

ALTER DATABASE

Use ALTER DATABASE to perform the following tasks:

- Drop all [fault groups](#) and their child fault groups from a database.
- Restore down nodes, and [revert active standby](#) nodes to standby status.
- Specify the subnet name of a public network to use for [import/export](#).
- Set and clear database [configuration parameters](#).

To see the current value of a parameter, query system table [CONFIGURATION_PARAMETERS](#) or use [SHOW DATABASE](#).

Syntax

```
ALTER DATABASE db-spec {  
  DROP ALL FAULT GROUP  
  | EXPORT ON { subnet-name | DEFAULT }  
  | RESET STANDBY  
  | SET [PARAMETER] parameter=value [...]  
  | CLEAR [PARAMETER] parameter[,...]  
}
```

Parameters

db-spec

Specifies the database to alter, one of the following:

- The database name
- **DEFAULT**: The current database

DROP ALL FAULT GROUP

[Drops all fault groups](#) defined on the specified database.

EXPORT ON

Specifies the network to use for importing and exporting data, one of the following:

- ***subnet-name***: A subnet of the public network.
- **DEFAULT**: Specifies to use a private network.

For details, see [Identify the database or nodes used for import/export](#), and [Changing node export addresses](#).

RESET STANDBY

Enterprise Mode only, restores all down nodes and [reverts their replacement](#) nodes to standby status. If any replaced nodes cannot resume activity, Vertica leaves their standby nodes in place.

SET [PARAMETER]

Sets the specified parameters.

CLEAR [PARAMETER]

Resets the specified parameters to their default values.

Privileges

Superuser

ALTER FAULT GROUP

Modifies an existing fault group. ALTER FAULT GROUP can perform the following tasks:

- Add a node to or drop a node from an existing fault group.
- Add a child fault group to or drop a child fault group from a parent fault group.
- Rename a fault group.

Syntax

```
ALTER FAULT GROUP fault-group-name {  
  | ADD NODE node-name  
  | DROP NODE node-name  
  | ADD FAULT GROUP child-fault-group-name  
  | DROP FAULT GROUP child-fault-group-name  
  | RENAME TO new-fault-group-name }
```

Parameters

fault-group-name

The existing fault group name you want to modify.

Tip

For a list of all fault groups defined in the cluster, query the [FAULT_GROUPS](#) system table.

node-name

The node name you want to add to or drop from the existing (parent) fault group.

child-fault-group-name

The name of the child fault group you want to add to or remove from an existing parent fault group.

new-fault-group-name

The new name for the fault group you want to rename.

Privileges

Superuser

Examples

This example shows how to rename the `parent0` fault group to `parent100` :

```
=> ALTER FAULT GROUP parent0 RENAME TO parent100;  
ALTER FAULT GROUP
```

Verify the change by querying the [FAULT_GROUPS](#) system table:

```
=> SELECT member_name FROM fault_groups;  
member_name  
-----  
v_exempledb_node0003  
parent100  
mygroup  
(3 rows)
```

- [FAULT_GROUPS](#)
- [CLUSTER_LAYOUT](#)
- [Fault groups](#)
- [High availability with fault groups](#)

ALTER FUNCTION statements

Vertica provides ALTER statements for each type of [user-defined extension](#) . Each ALTER statement modifies the metadata of a user-defined function in the Vertica catalog:

ALTER statement	Extension
ALTER FUNCTION (scalar)	User-defined scalar functions (UDSFs)
ALTER AGGREGATE FUNCTION	User-defined aggregate functions (UDAFs)
ALTER ANALYTIC FUNCTION	User-defined analytic functions (UDAnF)
ALTER TRANSFORM FUNCTION	User-defined transform functions (UDTFs)
ALTER statements for user-defined load :	
• ALTER SOURCE	Load source functions

• ALTER FILTER	Load filter functions
• ALTER PARSER	Load parser functions

Vertica also provides [ALTER FUNCTION \(SQL\)](#), which modifies the metadata of a user-defined SQL function.

In this section

- [ALTER AGGREGATE FUNCTION](#)
- [ALTER ANALYTIC FUNCTION](#)
- [ALTER FILTER](#)
- [ALTER FUNCTION \(scalar\)](#)
- [ALTER FUNCTION \(SQL\)](#)
- [ALTER PARSER](#)
- [ALTER SOURCE](#)
- [ALTER TRANSFORM FUNCTION](#)

ALTER AGGREGATE FUNCTION

Alters a [user-defined aggregate function](#).

Syntax

```
ALTER AGGREGATE FUNCTION [[db-name.]schema.]function-name( [ parameter-list ] ) {
  OWNER TO new-owner
  | RENAME TO new-name
  | SET SCHEMA new-schema
}
```

Parameters

[*db-name.*] *schema*

Database and [schema](#). The default schema is **public**. If you specify a database, it must be the current database.

function-name ``

Name of the SQL function to alter.

arg-list

Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.

Note

Vertica supports function overloading, and uses the parameter list to identify the function to alter.

OWNER TO *new-owner*

Transfers function ownership to another user.

RENAME TO *new-name*

Renames this function.

SET SCHEMA *new-schema*

Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

For these operations...	Schema privileges required...
RENAME TO (rename function)	CREATE, USAGE

SET SCHEMA (move function to another schema)

CREATE: destination schema
USAGE: current schema

See also

[CREATE AGGREGATE FUNCTION](#)

ALTER ANALYTIC FUNCTION

Alters a [user-defined analytic function](#).

Syntax

```
ALTER ANALYTIC FUNCTION [[db-name.]schema.]function-name( [ parameter-list ] ) {  
  OWNER TO new-owner  
  | RENAME TO new-name  
  | SET FENCED boolean-expr  
  | SET SCHEMA new-schema  
}
```

Parameters

[***db-name.***] ***schema***

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function-name

Name of the function to alter.

parameter-list

Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.

Note

Vertica supports function overloading, and uses the parameter list to identify the function to alter.

OWNER TO *new-owner*

Transfers function ownership to another user.

RENAME TO *new-name*

Renames this function.

SET FENCED { true | false }

Specifies whether to enable [fenced mode](#) for this function.

SET SCHEMA *new-schema*

Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	<ul style="list-style-type: none">• CREATE: destination schema• USAGE: current schema

See also

[CREATE ANALYTIC FUNCTION](#)

ALTER FILTER

Alters a [user-defined filter](#).

Syntax

```
ALTER FILTER [[db-name.]schema.]function-name( [ parameter-list ] ) {  
  OWNER TO new-owner  
  | RENAME TO new-name  
  | SET FENCED boolean-expr  
  | SET SCHEMA new-schema  
}
```

Parameters

[*db-name*.] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function-name

Name of the function to alter.

parameter-list

Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.

Note

Vertica supports function overloading, and uses the parameter list to identify the function to alter.

OWNER TO *new-owner*

Transfers function ownership to another user.

RENAME TO *new-name*

Renames this function.

SET FENCED { `true` | `false` }

Specifies whether to enable [fenced mode](#) for this function.

SET SCHEMA *new-schema*

Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	<ul style="list-style-type: none">• CREATE: destination schema• USAGE: current schema

See also

[CREATE FILTER](#)

ALTER FUNCTION (scalar)

Alters a [user-defined scalar function](#).

Syntax

```
ALTER FUNCTION [[db-name.]schema.]function-name( [ parameter-list ] ) {  
  OWNER TO new-owner  
  | RENAME TO new-name  
  | SET FENCED boolean-expr  
  | SET SCHEMA new-schema  
}
```

Parameters

[**db-name.**] **schema**

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function-name

Name of the function to alter.

parameter-list

Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.

Note

Vertica supports function overloading, and uses the parameter list to identify the function to alter.

OWNER TO *new-owner*

Transfers function ownership to another user.

RENAME TO *new-name*

Renames this function.

SET FENCED { true | false }

Specifies whether to enable [fenced mode](#) for this function.

SET SCHEMA *new-schema*

Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	<ul style="list-style-type: none">• CREATE: destination schema• USAGE: current schema

Examples

Rename function `UDF_one` to `UDF_two` :

```
=> ALTER FUNCTION UDF_one (int, int) RENAME TO UDF_two;
```

Move function `UDF_two` to schema `macros` :

```
=> ALTER FUNCTION UDF_two (int, int) SET SCHEMA macros;
```

Disable fenced mode for function `UDF_two` :

```
=> ALTER FUNCTION UDF_two (int, int) SET FENCED false;
```

See also

[CREATE FUNCTION \(scalar\)](#)

[ALTER FUNCTION \(SQL\)](#)

Alters a user-defined SQL function.

Syntax

```
ALTER FUNCTION [[db-name.]schema.]function-name( [arg-list] ) {
  OWNER TO new-owner
  | RENAME TO new-name
  | SET SCHEMA new-schema
}
```

Parameters

[*db-name*.] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function-name

The name of the SQL function to alter.

arg-list

A comma-delimited list of function argument names. If none, specify an empty list.

OWNER TO *new-owner*

Transfers function ownership to another user.

RENAME TO *new-name*

Renames this function.

SET SCHEMA *new-schema*

Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

For these operations...	Schema privileges required...
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	CREATE: destination schema USAGE: current schema

Examples

Rename function `SQL_one` to `SQL_two` :

```
=> ALTER FUNCTION SQL_one (int, int) RENAME TO SQL_two;
```

Move function `SQL_two` to schema `macros` :

```
=> ALTER FUNCTION SQL_two (int, int) SET SCHEMA macros;
```

Reassign ownership of `SQL_two` :

```
=> ALTER FUNCTION SQL_two (int, int) OWNER TO user1;
```

See also

- [CREATE FUNCTION \(SQL\)](#)
- [User-defined SQL functions](#)

ALTER PARSER

Alters a [user-defined parser](#).

Syntax

```
ALTER PARSER [[db-name.]schema.]function-name( [ parameter-list ] ) {
  OWNER TO new-owner
  | RENAME TO new-name
  | SET FENCED boolean-expr
  | SET SCHEMA new-schema
}
```

Parameters

[*db-name.*] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function-name

Name of the function to alter.

parameter-list

Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.

Note

Vertica supports function overloading, and uses the parameter list to identify the function to alter.

OWNER TO *new-owner*

Transfers function ownership to another user.

RENAME TO *new-name*

Renames this function.

SET FENCED { true | false }

Specifies whether to enable [fenced mode](#) for this function.

SET SCHEMA *new-schema*

Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	<ul style="list-style-type: none"> • CREATE: destination schema • USAGE: current schema

See also

[CREATE PARSER](#)

[ALTER SOURCE](#)

Alters a [user-defined load source](#) function.

Syntax

```
ALTER SOURCE [[db-name.]schema.]function-name( [ parameter-list ] ) {
  OWNER TO new-owner
  | RENAME TO new-name
  | SET FENCED boolean-expr
  | SET SCHEMA new-schema
}
```

Parameters

[*db-name.*] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function-name

Name of the function to alter.

parameter-list

Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.

Note

Vertica supports function overloading, and uses the parameter list to identify the function to alter.

OWNER TO *new-owner*

Transfers function ownership to another user.

RENAME TO *new-name*

Renames this function.

SET FENCED { `true` | `false` }

Specifies whether to enable [fenced mode](#) for this function.

SET SCHEMA *new-schema*

Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	<ul style="list-style-type: none">• CREATE: destination schema• USAGE: current schema

See also

[CREATE SOURCE](#)

[ALTER TRANSFORM FUNCTION](#)

Alters a [user-defined transform function](#).

Syntax

```
ALTER TRANSFORM FUNCTION [[db-name.]schema.]function-name( [ parameter-list ] ) {  
  OWNER TO new-owner  
  | RENAME TO new-name  
  | SET FENCED { true | false }  
  | SET SCHEMA new-schema  
}
```

Parameters

[*db-name.*] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function-name

Name of the function to alter.

parameter-list

Comma-delimited list of parameters that are defined for this function. If none, specify an empty list.

Note

Vertica supports function overloading, and uses the parameter list to identify the function to alter.

OWNER TO *new-owner*

Transfers function ownership to another user.

RENAME TO *new-name*

Renames this function.

SET FENCED { true | false }

Specifies whether to enable [fenced mode](#) for this function.

SET SCHEMA *new-schema*

Moves the function to another schema.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Function owner
- ALTER privilege on the function

For certain operations, non-superusers must also have the following schema privileges:

Operation	Schema privileges required
RENAME TO (rename function)	CREATE, USAGE
SET SCHEMA (move function to another schema)	<ul style="list-style-type: none"> • CREATE: destination schema • USAGE: current schema

See also

[CREATE TRANSFORM FUNCTION](#)

ALTER HCATALOG SCHEMA

Alters parameter values on a schema that was created with [CREATE HCATALOG SCHEMA](#). HCatalog schemas are used by the HCatalog Connector to access data stored in a Hive data warehouse. For more information, see [Using the HCatalog Connector](#).

Some parameters cannot be altered after creation. If you need to change one of those values, delete and recreate the schema instead. You can use ALTER HCATALOG SCHEMA to change the following parameters:

- **HOSTNAME**
- **PORT**
- **HIVESERVER2_HOSTNAME**
- **WEBSERVICE_HOSTNAME**
- **WEBSERVICE_PORT**
- **WEBHDFS_ADDRESS**
- **HCATALOG_CONNECTION_TIMEOUT**
- **HCATALOG_SLOW_TRANSFER_LIMIT**
- **HCATALOG_SLOW_TRANSFER_TIME**
- **SSL_CONFIG**
- **CUSTOM_PARTITIONS**

Syntax

```
ALTER HCATALOG SCHEMA schema-name SET [param=value]+;
```

Parameters

Parameter	Description
<i>schema-name</i>	The name of the schema in the Vertica catalog to alter. The tables in the Hive database are available through this schema.

<i>param</i>	The name of the parameter to alter.
<i>value</i>	The new value for the parameter. You must specify a value; this statement does not read default values from configuration files like <code>CREATE HCATALOG SCHEMA</code> .

Privileges

One of the following:

- Superuser
- Schema owner

Examples

The following example shows how to change the Hive metastore hostname and port for the "hcat" schema. In this example, Hive uses High Availability metastore.

```
=> ALTER HCATALOG SCHEMA hcat SET HOSTNAME='thrift://ms1.example.com:9083,thrift://ms2.example.com:9083';
```

The following example shows the error you receive if you try to set an unalterable parameter.

```
=> ALTER HCATALOG SCHEMA hcat SET HCATALOG_USER='admin';
ERROR 4856: Syntax error at or near "HCATALOG_USER" at character 39
```

ALTER LIBRARY

Replaces the library file that is currently associated with a UDX library in the Vertica catalog. Vertica automatically distributes copies of the updated file to all cluster nodes. UDXs defined in the catalog that reference the updated library automatically start using the updated library file. A UDX is considered to be the same if its name and signature match.

The current and replacement libraries must be written in the same language.

Caution

If a UDX function that is present in the original library is not present in the updated library, it is automatically dropped. This can result in loss of data if that function is in use, for example if a table depends on it to populate a column.

Syntax

```
ALTER LIBRARY [[database.]schema.]name [DEPENDS 'depends-path'] AS 'path';
```

Arguments

schema

Database and [schema](#). The default schema is `public` . If you specify a database, it must be the current database.

name

The name of an existing library created with [CREATE LIBRARY](#) .

DEPENDS '*depends-path*'

Files or libraries on which this library depends, one or more files or directories on the initiator node file system or other [supported file systems or object stores](#) . For a directory, end the path entry with a slash (`/`), optionally followed by a wildcard (`*`). To specify more than one file, separate entries with colons (`:`).

If any path entry contain colons, such as a URI, place brackets around the entire DEPENDS path and use double quotes for the individual path elements, as in the following example:

```
DEPENDS ["'s3://mybucket/gson-2.3.1.jar'"]
```

To specify libraries with multiple directory levels, see [Multi-level Library Dependencies](#) .

DEPENDS has no effect for libraries written in R. R packages must be installed locally on each node, including external dependencies.

Important

The performance of CREATE LIBRARY can degrade in Eon Mode, in proportion to the number and depth of dependencies specified by the DEPENDS clause.

AS *path*

The absolute path on the initiator node file system of the replacement library file.

Privileges

Superuser, or [UDXDEVELOPER](#) and CREATE on the schema. Non-superusers must explicitly enable the UDXDEVELOPER role. See [CREATE LIBRARY](#) for examples.

Multi-level library dependencies

If a DEPENDS clause specifies a library with multiple directory levels, Vertica follows the library path to include all subdirectories of that library. For example, the following CREATE LIBRARY statement enables the UDX library *mylib* to import all Python packages and modules that it finds in subdirectories of *site-packages* :

```
=> CREATE LIBRARY mylib AS '/path/to/python_udx' DEPENDS '/path/to/python/site-packages' LANGUAGE 'Python';
```

Important

DEPENDS can specify Java library dependencies that are up to 100 levels deep.

Examples

This example shows how to update an already-defined library named *myFunctions* with a new file.

```
=> ALTER LIBRARY myFunctions AS '/home/dbadmin/my_new_functions.so';
```

See also

[Developing user-defined extensions \(UDxs\)](#)

ALTER LOAD BALANCE GROUP

Changes the configuration of a load balance group.

Syntax

```
ALTER LOAD BALANCE GROUP group-name {  
  RENAME TO new-name |  
  SET FILTER TO 'ip-cidr-addr' |  
  SET POLICY TO 'policy' |  
  ADD {ADDRESS | FAULT GROUP | SUBCLUSTER} add-list |  
  DROP {ADDRESS | FAULT GROUP | SUBCLUSTER} drop-list  
}
```

Parameters

group-name

Name of an existing load balance group to change.

RENAME TO *new-name*

Renames the group to *new-name* .

SET FILTER TO '*ip-cidr-addr*'

An IPv4 or IPv6 CIDR to replace the existing IP address filter that selects which members of a fault group or subcluster to include in the load balance group. This setting is only valid if the load balance group contains fault groups or subclusters.

SET POLICY TO '*policy*'

Changes the policy the load balance group uses to select the target node for the incoming connection. One of:

- ROUNDROBIN
- RANDOM
- NONE

See [CREATE LOAD BALANCE GROUP](#) for details.

ADD {ADDRESS | FAULT GROUP | SUBCLUSTER }

Adds objects of the specified type to the load balance group. Load balance groups can only contain one type of object. For example, if you created the load balance group using a list of addresses, you can only add additional addresses, not fault groups or subclusters.

add-list

A comma-delimited list of objects (addresses, fault groups, or subclusters) to add to the fault group.

DROP {ADDRESS | FAULT GROUP | SUBCLUSTER}

Removes objects of the specified type from the load balance group (addresses, fault groups, or subclusters). The object type must match the type of the objects already in the load balance group.

drop-list

The list of objects to remove from the load balance group.

Privileges

Superuser

Examples

Remove an address from the load balance group named group_2.

```
=> SELECT * FROM LOAD_BALANCE_GROUPS;
 name | policy | filter | type      | object_name
-----+-----+-----+-----+-----
group_1 | ROUNDROBIN |      | Network Address Group | node01
group_1 | ROUNDROBIN |      | Network Address Group | node02
group_2 | ROUNDROBIN |      | Network Address Group | node03
(3 rows)

=> ALTER LOAD BALANCE GROUP group_2 DROP ADDRESS node03;
ALTER LOAD BALANCE GROUP

=> SELECT * FROM LOAD_BALANCE_GROUPS;
 name | policy | filter | type      | object_name
-----+-----+-----+-----+-----
group_1 | ROUNDROBIN |      | Network Address Group | node01
group_1 | ROUNDROBIN |      | Network Address Group | node02
group_2 | ROUNDROBIN |      | Empty Group          |
(3 rows)
```

The following example adds three network addresses to the group named group_2:

```
=> ALTER LOAD BALANCE GROUP group_2 ADD ADDRESS node01,node02,node03;
ALTER LOAD BALANCE GROUP
=> SELECT * FROM load_balance_groups WHERE name = 'group_2';
-[ RECORD 1 ]-----
name      | group_2
policy    | ROUNDROBIN
filter    |
type      | Network Address Group
object_name | node01
-[ RECORD 2 ]-----
name      | group_2
policy    | ROUNDROBIN
filter    |
type      | Network Address Group
object_name | node02
-[ RECORD 3 ]-----
name      | group_2
policy    | ROUNDROBIN
filter    |
type      | Network Address Group
object_name | node03
```

See also

- [ALTER NETWORK ADDRESS](#)
- [ALTER ROUTING RULE](#)
- [CREATE LOAD BALANCE GROUP](#)
- [LOAD_BALANCE_GROUPS](#)
- [NETWORK_ADDRESSES](#)

ALTER MODEL

Allows users to rename an existing model, change ownership, or move it to a another schema.

Syntax

```
ALTER MODEL [[database.]schema.]model
 { OWNER TO owner
 | RENAME TO new-name
 | SET SCHEMA schema
 | { INCLUDE | EXCLUDE | MATERIALIZE } [ SCHEMA ] PRIVILEGES }
```

Parameters

[*database.*] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

model

Identifies the model to alter.

OWNER TO *owner*

Reassigns ownership of this model to *owner*. If a non-superuser, you must be the current owner.

RENAME TO

Renames the mode, where *new-name* conforms to conventions described in [Identifiers](#). It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

SET SCHEMA *schema*

Moves the model from one schema to another. If privilege inheritance is enabled with `INCLUDE SCHEMA PRIVILEGES`, the model inherits the privileges of its new parent schema.

[{ **INCLUDE** | **EXCLUDE** | **MATERIALIZE** } [**SCHEMA**] **PRIVILEGES**]

The `INCLUDE` and `EXCLUDE` parameters determine whether the model [inherits](#) the privileges of its parent schema, overriding the [schema-level setting](#):

- `INCLUDE SCHEMA PRIVILEGES`: The model inherits the privileges of its parent schema. This parameter has no effect while privilege inheritance is disabled at the database level with [DisableInheritedPrivileges](#).
- `EXCLUDE SCHEMA PRIVILEGES`: The model does not inherit the privileges of its parent schema.

The `MATERIALIZE` parameter converts inherited privileges into explicit [grants](#) on the model. If privilege inheritance is disabled at the database level with `DisableInheritedPrivileges`, `MATERIALIZE` converts the set of inherited privileges that would be on the model if privilege inheritance was enabled.

Privileges

Non-superuser: `USAGE` on the schema and one of the following:

- Model owner
- `ALTER` privilege on the model

For certain operations, non-superusers must have the following [schema privileges](#):

Schema privileges required...	For these operations...
<code>CREATE</code> , <code>USAGE</code>	Rename model
<code>CREATE</code> : destination schema <code>USAGE</code> : current schema	Move model to another schema

Examples

To move a model to another schema:

```
=> ALTER MODEL my_kmeans_model SET SCHEMA clustering_models;
ALTER MODEL
```

To rename a model:

```
=> ALTER MODEL my_kmeans_model RENAME TO kmeans_model;
```

To change the owner of the model:

```
=> ALTER MODEL kmeans_model OWNER TO analytics_user;
```

ALTER NETWORK ADDRESS

Changes the configuration of an existing network address.

Syntax

```
ALTER NETWORK ADDRESS name {  
  RENAME TO new-name  
  | SET TO 'ip-addr' [PORT port-number]  
  | { ENABLE | DISABLE }  
}
```

Parameters

name

Name of an existing network address to change.

RENAME TO *new-name*

Renames the network address to *new-name*. This name change has no effect on the network address's membership in load balance groups.

SET TO '*ip-addr*'

Changes the IP address assigned to the network address.

PORT *port-number*

Sets the port number for the network address. You must supply a network address when altering the port number.

ENABLE | DISABLE

Enables or disables the network address.

Examples

Rename the network address from `test_addr` to `alt_node1`, then change its IP address to `192.168.1.200` with port number `4000`:

```
=> ALTER NETWORK ADDRESS test_addr RENAME TO alt_node1;  
ALTER NETWORK ADDRESS  
=> ALTER NETWORK ADDRESS alt_node1 SET TO '192.168.1.200' PORT 4000;  
ALTER NETWORK ADDRESS
```

See also

- [ALTER LOAD BALANCE GROUP](#)
- [ALTER ROUTING RULE](#)
- [CREATE LOAD BALANCE GROUP](#)
- [LOAD_BALANCE_GROUPS](#)
- [NETWORK_ADDRESSES](#)

ALTER NETWORK INTERFACE

Deprecated

This statement has been deprecated. Instead, use [ALTER NETWORK ADDRESS](#).

Renames a network interface.

Syntax

```
ALTER NETWORK INTERFACE network-interface-name RENAME TO new-network-interface-name
```

Parameters

network-interface-name

The name of the existing network interface.

new-network-interface-name

The new name for the network interface.

Privileges

Superuser

Examples

Rename a network interface:

```
=> ALTER NETWORK INTERFACE myNetwork RENAME TO myNewNetwork;
```

ALTER NODE

Sets and clears node-level configuration parameters on the specified node. ALTER NODE also performs the following management tasks:

- Changes the node type.
- Specifies the network interface of the public network on individual nodes that are used for import and export.
- Replaces a down node.

For information about removing a node, see

- [Removing nodes from a database](#)
- [Removing hosts from a cluster](#)

Syntax

```
ALTER NODE node-name {  
  EXPORT ON { network-interface | DEFAULT }  
  | [IS] node-type  
  | REPLACE [ WITH standby-node ]  
  | RESET  
  | SET [PARAMETER] parameter=value[,...]  
  | CLEAR [PARAMETER] parameter[,...]  
}
```

Parameters

node-name

The name of the node to alter.

[IS] *node-type*

Changes the node type, where *node-type* is one of the following:

- PERMANENT: (default): A node that stores data.
- EPHEMERAL: A node that is in transition from one type to another—typically, from PERMANENT to either STANDBY or EXECUTE.
- STANDBY: A node that is reserved to replace any node when it goes down. A standby node stores no segments or data until it is called to replace a down node. When used as a replacement node, Vertica changes its type to PERMANENT. For more information, see [Active standby nodes](#).
- EXECUTE: A node that is reserved for computation purposes only. An execute node contains no segments or data.

Note

STANDBY and EXECUTE node types are supported only in Enterprise Mode.

EXPORT ON

Specifies the network to use for [importing and exporting](#) data, one of the following:

- ***network-interface***: The name of a network interface of the public network.
- **DEFAULT**: Use the default network interface of the public network, as specified by [ALTER DATABASE](#).

REPLACE [WITH *standby-node*]

Enterprise Mode only, replaces the specified node with an available active standby node. If you omit the **WITH** clause, Vertica tries to find a replacement node from the same fault group as the down node.

If you specify a node that is not down, Vertica ignores this statement.

RESET

Enterprise Mode only, restores the specified down node and returns its replacement to standby status. If the down node cannot resume activity, Vertica ignores this statement and leaves the standby node in place.

SET [PARAMETER]

Sets one or more configuration parameters to the specified value at the node level.

CLEAR [PARAMETER]

Clears one or more specified configuration parameters.

Privileges

Superuser

Examples

Specify to use the default network interface of public network on `v_vmart_node0001` for import/export operations:

```
=> ALTER NODE v_vmart_node0001 EXPORT ON DEFAULT;
```

Replace down node `v_vmart_node0001` with an active standby node, then restore it:

```
=> ALTER NODE v_vmart_node0001 REPLACE WITH standby1;  
...  
=> ALTER NODE v_vmart_node0001 RESET;
```

Set and clear configuration parameter `MaxClientSessions` :

```
=> ALTER NODE v_vmart_node0001 SET MaxClientSessions = 0;  
...  
=> ALTER NODE v_vmart_node0001 CLEAR MaxClientSessions;
```

Set the node type as `EPHEMERAL` :

```
=> ALTER NODE v_vmart_node0001 IS EPHEMERAL;
```

ALTER NOTIFIER

Updates an existing notifier.

Note

To change the action URL associated with an existing identifier, [drop the notifier](#) and recreate it.

Syntax

```
ALTER NOTIFIER notifier-name  
  [ ENABLE | DISABLE ]  
  [ MAXPAYLOAD 'max-payload-size' ]  
  [ MAXMEMORYSIZE 'max-memory-size' ]  
  [ TLS CONFIGURATION tls-configuration ]  
  [ TLSMODE 'tls-mode' ]  
  [ CA BUNDLE bundle-name [ CERTIFICATE certificate-name ] ]  
  [ IDENTIFIED BY 'uuid' ]  
  [ [NO] CHECK COMMITTED ]  
  [ PARAMETERS 'adapter-params' ]
```

Parameters

notifier-name

Specifies the notifier to update.

[NO] CHECK COMMITTED

Specifies to wait for delivery confirmation before sending the next message in the queue. Not all messaging systems support delivery confirmation.

ENABLE | DISABLE

Specifies whether to enable or disable the notifier.

MAXPAYLOAD

The maximum size of the message, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows:

```
MAXPAYLOAD integer{K|M|G|T}
```

The default setting is adapter-specific—for example, 1 M for Kafka.

Changes to this parameter take effect either after the notifier is disabled and reenabled or after the database restarts.

MAXMEMORYSIZE

The maximum size of the internal notifier, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes as follows:

```
MAXMEMORYSIZE integer{K|M|G|T}
```

If the queue exceeds this size, the notifier drops excess messages.

TLS CONFIGURATION *tls-configuration*

The [TLS CONFIGURATION](#) to use for TLS.

Notifiers support the following TLS modes:

- DISABLE
- TRY_VERIFY (behaves like VERIFY_CA)
- VERIFY_CA
- VERIFY_FULL

If the notifier **ACTION** is 'syslog' or 'sns', this parameter has no effect.

To encrypt messages sent to syslog, you must configure syslog for TLS.

To encrypt messages sent to an SNS endpoint, you must set the following configuration parameters:

- SNSCAFile or AWSCAFile
- SNSCAPath or AWSCAPath
- SNSEnableHttps

TLSMODE ' *tls-mode* '

Deprecated

This parameter has been superseded by the TLS CONFIGURATION parameter. If you use this parameter while the TLS CONFIGURATION parameter is not set, Vertica automatically creates a new TLS Configuration for the notifier uses the same values as the deprecated parameter.

Specifies the type of connection between the notifier and an endpoint, one of the following:

- **disable** (default): Plaintext connection.
- **verify-ca**: Encrypted connection, and the server's certificate is verified as being signed by a trusted CA.

If you set this parameter to **verify-ca**, the generated TLS Configuration will be set to TRY_VERIFY, which has the same behavior as VERIFY_CA.

If the notifier **ACTION** is 'syslog' or 'sns', this parameter has no effect.

To encrypt messages sent to syslog, you must configure syslog for TLS.

To encrypt messages sent to an SNS endpoint, you must set the following configuration parameters:

- SNSCAFile or AWSCAFile
- SNSCAPath or AWSCAPath
- SNSEnableHttps

CA BUNDLE *bundle-name*

Deprecated

This parameter has been superseded by the TLS CONFIGURATION parameter. If you use this parameter while the TLS CONFIGURATION parameter is not set, Vertica automatically creates a new TLS Configuration for the notifier uses the same values as the deprecated parameter.

Specifies a [CA bundle](#). The certificates inside the bundle are used to validate the Kafka server's certificate if the **TLSMODE** requires it.

If a CA bundle is specified for a notifier that currently uses **disable**, which doesn't validate the Kafka server's certificate, the bundle will go unused when connecting to the Kafka server. This behavior persists unless the **TLSMODE** is changed to one that validates server certificates.

Changes to contents of the CA bundle take effect either after the notifier is disabled and re-enabled or after the database restarts. However, changes to which CA bundle the notifier uses takes effect immediately.

If the notifier **ACTION** is 'syslog' or 'sns', this parameter has no effect.

To encrypt messages sent to syslog, you must configure syslog for TLS.

To encrypt messages sent to an SNS endpoint, you must set the following configuration parameters:

- SNSCAFile or AWSCAFile
- SNSCAPath or AWSCAPath
- SNSEnableHttps

CERTIFICATE *certificate-name*

Deprecated

This parameter has been superseded by the TLS CONFIGURATION parameter. If you use this parameter while the TLS CONFIGURATION parameter is not set, Vertica automatically creates a new TLS Configuration for the notifier uses the same values as the deprecated parameter.

Specifies a [client certificate](#) for validation by the endpoint.

If the notifier **ACTION** is 'syslog' or 'sns', this parameter has no effect.

To encrypt messages sent to syslog, you must configure syslog for TLS.

To encrypt messages sent to an SNS endpoint, you must set the following configuration parameters:

- SNSCAFile or AWSCAFile
- SNSCAPath or AWSCAPath
- SNSEnableHttps

IDENTIFIED BY ' *uuid* '

Specifies the notifier's unique identifier. If set, all the messages published by this notifier have this attribute.

PARAMETERS ' *adapter-params* '

Specifies one or more optional adapter parameters that are passed as a string to the adapter. Adapter parameters apply only to the adapter associated with the notifier.

Changes to this parameter take effect either after the notifier is disabled and reenabled or after the database restarts.

For Kafka notifiers, refer to [Kafka and Vertica configuration settings](#).

Privileges

Superuser

Encrypted notifiers for SASL_SSL Kafka configurations

Follow this procedure to create or alter notifiers for Kafka endpoints that use SASL_SSL. Note that you must repeat this procedure whenever you change the TLSMODE, certificates, or CA bundle for a given notifier.

1. [Create a TLS Configuration](#) with the desired TLS mode, certificate, and CA certificates.
2. Use CREATE or ALTER to disable the notifier and set the TLS Configuration:

```
=> ALTER NOTIFIER encrypted_notifier  
DISABLE  
TLS CONFIGURATION kafka_tls_config;
```

3. ALTER the notifier and set the proper rdkafka adapter parameters for SASL_SSL:

```
=> ALTER NOTIFIER encrypted_notifier PARAMETERS  
'sasl.username=user;sasl.password=password;sasl.mechanism=PLAIN;security.protocol=SASL_SSL';
```

4. Enable the notifier:

```
=> ALTER NOTIFIER encrypted_notifier ENABLE;
```

Examples

Update the settings on an existing notifier:

```
=> ALTER NOTIFIER my_dc_notifier
ENABLE
MAXMEMORYSIZE '2G'
IDENTIFIED BY 'f8b0278a-3282-4e1a-9c86-e0f3f042a971'
CHECK COMMITTED;
```

Add a TLS Configuration to a notifier. To create a custom TLS Configuration, see [TLS configurations](#):

```
=> ALTER NOTIFIER my_notifier TLS CONFIGURATION notifier_tls_config
```

See also

- [CREATE NOTIFIER](#)
- [DROP NOTIFIER](#)
- [Monitoring Vertica using notifiers](#)

ALTER PROCEDURE (stored)

Alters a [stored procedure](#), retaining any existing [grants](#).

Syntax

```
ALTER PROCEDURE procedure ( [ [ parameter_mode ] [ parameter ] parameter_type [, ...] ] )
[ SECURITY { INVOKER | DEFINER }
| RENAME TO new_procedure_name
| OWNER TO new_owner
| SET SCHEMA new_schema
| SOURCE TO new_source
]
```

Parameters

procedure

The procedure to alter.

parameter_mode

The [IN and INOUT parameters](#) of the stored procedure.

parameter

The name of the parameter.

parameter_type

The [type](#) of the parameter.

SECURITY { INVOKER | DEFINER }

Specifies whether to execute the procedure with the privileges of the invoker or its definer (owner).

For details, see [Executing stored procedures](#).

RENAME TO *new_procedure_name*

The new name for the procedure.

OWNER TO *new_owner*

The new owner (definer) of the procedure.

SET SCHEMA *new_schema*

The new schema of the procedure.

SOURCE TO *new_source*

The new procedure source code. For details, see [Scope and structure](#).

Privileges

OWNER TO

Superuser

RENAME and SCHEMA TO

Non-superuser:

- CREATE on the procedure's schema
- Ownership of the procedure

Other operations

Non-superuser: Ownership of the procedure

Examples

See [Altering stored procedures](#).

ALTER PROFILE

Changes a [profile](#). All parameters that are not set in a profile inherit their setting from the default profile. You can use **ALTER PROFILE** to change the default profile.

Syntax

```
ALTER PROFILE name LIMIT [  
  PASSWORD_LIFE_TIME setting  
  PASSWORD_MIN_LIFE_TIME setting  
  PASSWORD_GRACE_TIME setting  
  FAILED_LOGIN_ATTEMPTS setting  
  PASSWORD_LOCK_TIME setting  
  PASSWORD_REUSE_MAX setting  
  PASSWORD_REUSE_TIME setting  
  PASSWORD_MAX_LENGTH setting  
  PASSWORD_MIN_LENGTH setting  
  PASSWORD_MIN_LETTERS setting  
  PASSWORD_MIN_UPPERCASE_LETTERS setting  
  PASSWORD_MIN_LOWERCASE_LETTERS setting  
  PASSWORD_MIN_DIGITS setting  
  PASSWORD_MIN_SYMBOLS setting  
  PASSWORD_MIN_CHAR_CHANGE setting ]
```

Parameters

Note

To reset a parameter to inherit from the default profile, set its value to **default**.

Name	Description
<i>name</i>	The name of the profile to create, where * <i>name</i> *conforms to conventions described in Identifiers . To modify the default profile, set <i>name</i> to default . For example: ALTER PROFILE DEFAULT LIMIT PASSWORD_MIN_SYMBOLS 1;
PASSWORD_LIFE_TIME	Set to an integer value, one of the following: <ul style="list-style-type: none">≥ 1: The number of days a password remains valid.UNLIMITED: Password remains valid indefinitely. After your password's lifetime and grace period expire, you must change your password on your next login, if you have not done so already.
PASSWORD_MIN_LIFE_TIME	Set to an integer value, one of the following: <ul style="list-style-type: none">Default: 0≥ 1: The number of days a password must be set before it can be changedUNLIMITED: Password can be reset at any time.

<code>PASSWORD_GRACE_TIME</code>	<p>Set to an integer value, one of the following:</p> <ul style="list-style-type: none"> • ≥ 1: The number of days a password can be used after it expires. • <code>UNLIMITED</code> : No grace period.
<code>FAILED_LOGIN_ATTEMPTS</code>	<p>Set to an integer value, one of the following:</p> <ul style="list-style-type: none"> • ≥ 1: The number of consecutive failed login attempts Vertica allows before locking your account. • <code>UNLIMITED</code> : Vertica allows an unlimited number of failed login attempts.
<code>PASSWORD_LOCK_TIME</code>	<ul style="list-style-type: none"> • ≥ 1: The number of days (units configurable with PasswordLockTimeUnit) a user's account is locked after <code>FAILED_LOGIN_ATTEMPTS</code> number of login attempts. The account is automatically unlocked when the lock time elapses. • <code>UNLIMITED</code> : Account remains indefinitely inaccessible until a superuser manually unlocks it.
<code>PASSWORD_REUSE_MAX</code>	<p>Set to an integer value, one of the following:</p> <ul style="list-style-type: none"> • ≥ 1: The number of times you must change your password before you can reuse an earlier password. • <code>UNLIMITED</code> : You can reuse an earlier password without any intervening changes.
<code>PASSWORD_REUSE_TIME</code>	<p>Set to an integer value, one of the following:</p> <ul style="list-style-type: none"> • ≥ 1: The number of days that must pass after a password is set before you can reuse it. • <code>UNLIMITED</code> : You can reuse an earlier password immediately.
<code>PASSWORD_MAX_LENGTH</code>	<p>The maximum number of characters allowed in a password, one of the following:</p> <ul style="list-style-type: none"> • Integer between 8 and 512, inclusive
<code>PASSWORD_MIN_LENGTH</code>	<p>The minimum number of characters required in a password, one of the following:</p> <ul style="list-style-type: none"> • 0 to <code>PASSWORD_MAX_LENGTH</code> • <code>UNLIMITED</code> : Minimum of <code>PASSWORD_MAX_LENGTH</code>
<code>PASSWORD_MIN_LETTERS</code>	<p>Minimum number of letters (a-z and A-Z) that must be in a password, one of the following:</p> <ul style="list-style-type: none"> • Integer between 0 and <code>PASSWORD_MAX_LENGTH</code> , inclusive • <code>UNLIMITED</code> : 0 (no minimum)
<code>PASSWORD_MIN_UPPERCASE_LETTERS</code>	<p>Minimum number of uppercase letters (A-Z) that must be in a password, one of the following:</p> <ul style="list-style-type: none"> • Integer between 0 and <code>PASSWORD_MAX_LENGTH</code> , inclusive • <code>UNLIMITED</code> : 0 (no minimum)
<code>PASSWORD_MIN_LOWERCASE_LETTERS</code>	<p>Minimum number of lowercase letters (a-z) that must be in a password, one of the following:</p> <ul style="list-style-type: none"> • Integer between 0 and <code>PASSWORD_MAX_LENGTH</code> , inclusive • <code>UNLIMITED</code> : 0 (no minimum)
<code>PASSWORD_MIN_DIGITS</code>	<p>Minimum number of digits (0-9) that must be in a password, one of the following:</p> <ul style="list-style-type: none"> • Integer between 0 and <code>PASSWORD_MAX_LENGTH</code> , inclusive • <code>UNLIMITED</code> : 0 (no minimum)

PASSWORD_MIN_SYMBOLS	<p>Minimum number of symbols—printable non-letter and non-digit characters such as \$, #, @—that must be in a password, one of the following:</p> <ul style="list-style-type: none"> • Integer between 0 and PASSWORD_MAX_LENGTH , inclusive • UNLIMITED : 0 (no minimum)
PASSWORD_MIN_CHAR_CHANGE	<p>Minimum number of characters that must be different from the previous password:</p> <ul style="list-style-type: none"> • Default: 0 • Integer between 0 and PASSWORD_MAX_LENGTH , inclusive • UNLIMITED : 0 (no minimum)

Privileges

Superuser

Profile settings and client authentication

The following profile settings affect [client authentication methods](#), such as LDAP or GSS:

- **FAILED_LOGIN_ATTEMPTS**
- **PASSWORD_LOCK_TIME**

All other profile settings are used only by Vertica to manage its passwords.

Examples

```
ALTER PROFILE sample_profile LIMIT FAILED_LOGIN_ATTEMPTS 3;
```

See also

- [CREATE PROFILE](#)
- [DROP PROFILE](#)
- [Creating a database name and password](#)

ALTER PROFILE RENAME

Rename an existing profile.

Syntax

```
ALTER PROFILE name RENAME TO new-name;
```

Parameters

name

The current name of the profile.

new-name

The new name for the profile.

Privileges

Superuser

Examples

This example shows how to rename an existing profile.

```
ALTER PROFILE sample_profile RENAME TO new_sample_profile;
```

See also

- [ALTER PROFILE](#)
- [CREATE PROFILE](#)
- [DROP PROFILE](#)

ALTER PROJECTION

Changes the DDL of the specified projection.

Syntax

```
ALTER PROJECTION [[database.]schema.]projection
 { RENAME TO new-name | ON PARTITION RANGE BETWEEN min-val AND max-val | { ENABLE | DISABLE } }
```

Parameters

[*database.*] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

projection

The projection to change, where *projection* can be one of the following:

- Projection base name: Rename all projections that share this base name.
- Projection name: Rename the specified projection and its base name. If the projection is segmented, its buddies are unaffected by this change.

See [Projection naming](#) for projection name conventions.

RENAME TO *new-name*

The new projection name.

ON PARTITION RANGE

Note

Valid only for projections that were created with a partition range.

Limits projection data to a range of partition keys. The minimum value must be less than or equal to the maximum value.

Values can be NULL. A null minimum value indicates no lower bound and a null maximum value indicates no upper bound. If both are NULL, this statement drops the projection endpoints, producing a regular projection instead of a range projection.

If the new range of keys is outside the previous range, Vertica throws a warning that the projection is out of date and must be refreshed before it can be used.

For other requirements and usage details, see [Partition range projections](#).

ENABLE | DISABLE

Specifies whether to mark this projection as unavailable for queries on its anchor table. If a projection is the queried table's only superprojection, attempts to disable it return with a rollback message. ENABLE restores the projection's availability to query planning. You can also mark a projection as unavailable for individual queries using the hint [SKIP_PROJS](#).

Default: ENABLE

Privileges

Non-superuser, CREATE and USAGE on the schema and one of the following anchor table privileges:

- Table owner
- ALTER privilege
- SELECT privilege only if defining a [partition range projection](#)

Syntactic sugar

The statement

```
=> ALTER PROJECTION foo REMOVE PARTITION RANGE;
```

has the same effect as

```
=> ALTER PROJECTION foo ON PARTITION RANGE BETWEEN NULL AND NULL;
```

Examples

```
=> SELECT export_tables('', 'public.store_orders');
```

```
export_tables
```

```
CREATE TABLE public.store_orders
```

```
(  
  order_no int,  
  order_date timestamp NOT NULL,  
  shipper varchar(20),  
  ship_date date NOT NULL
```

```
);  
(1 row)
```

```
=> CREATE PROJECTION store_orders_p AS SELECT * from store_orders;
```

```
CREATE PROJECTION
```

```
=> ALTER PROJECTION store_orders_p RENAME to store_orders_new;
```

```
ALTER PROJECTION
```

```
=> ALTER PROJECTION store_orders_new DISABLE;
```

```
=> SELECT * FROM store_orders_new;
```

```
ERROR 3586: Insufficient projections to answer query
```

```
DETAIL: No projections eligible to answer query
```

```
HINT: Projection store_orders_new not used in the plan because the projection is disabled.
```

```
=> ALTER PROJECTION store_orders_new ENABLE;
```

See also

[CREATE PROJECTION](#)

[ALTER RESOURCE POOL](#)

Modifies an existing resource pool by setting one or more parameters.

You can use ALTER RESOURCE POOL to modify some parameters in Vertica built-in resource pools. For details on default settings and restrictions, see [Built-in resource pools configuration](#).

Important

Changes to parameters of the built-in [GENERAL resource pool](#) take effect only when the database restarts.

Syntax

```
ALTER RESOURCE POOL pool-name [ FOR subcluster ] parameter-name setting[...]
```

Arguments

pool-name

Name of the resource pool to modify.

FOR *subcluster*

Eon Mode only, the subcluster to associate with this resource pool, where *subcluster* is one of the following:

- **SUBCLUSTER *subcluster-name***: Resource pool for an existing subcluster. You cannot be connected to this subcluster, otherwise Vertica returns an error.
- **CURRENT SUBCLUSTER**: Resource pool for the subcluster that you are connected to.

Important

You cannot use ALTER RESOURCE POOL to convert a global resource pool to a subcluster-level resource pool.

parameter-name setting

A resource pool parameter and its new setting. To reset this parameter to its default value, specify **DEFAULT**.

If you specify a subcluster, you can alter only the **MAXMEMORYSIZE**, **MAXQUERYMEMORYSIZE**, and **MEMORYSIZE** parameters for [built-in pools](#).

Parameters

Note

Default values specified here pertain only to user-defined resource pools. For built-in pool default values, see [Built-in resource pools configuration](#), or query system table [RESOURCE_POOL_DEFAULTS](#).

CASCADE TO

Secondary resource pool for executing queries that exceed the [RUNTIMECAP](#) setting of their assigned resource pool:

```
CASCADE TO secondary-pool
```

CPUAFFINITYMODE

Specifies whether the resource pool has exclusive or shared use of the CPUs specified in [CPUAFFINITYSET](#):

```
CPUAFFINITYMODE { SHARED | EXCLUSIVE | ANY }
```

- **SHARED**: Queries that run in this resource pool share its [CPUAFFINITYSET](#) CPUs with other Vertica resource pools.
- **EXCLUSIVE**: Dedicates [CPUAFFINITYSET](#) CPUs to this resource pool only, and excludes other Vertica resource pools. If [CPUAFFINITYSET](#) is set as a percentage, then that percentage of CPU resources available to Vertica is assigned solely for this resource pool.
- **ANY**: Queries in this resource pool can run on any CPU, invalid if [CPUAFFINITYSET](#) designates CPU resources.

Default: **ANY**

CPUAFFINITYSET

CPUs available to this resource pool. All cluster nodes must have the same number of CPUs. The CPU resources assigned to this set are unavailable to general resource pools.

```
CPUAFFINITYSET {  
  'cpu-index[,...]'  
| 'cpu-indexi-cpu-indexn'  
| 'integer%'  
| NONE  
}
```

- ***cpu-index* [...]**: Dedicates one or more comma-delimited CPUs to this resource pool.
- ***cpu-indexi-cpu-indexn***: Dedicates a range of contiguous CPU indexes *i* through *n* to this resource pool.
- ***integer%***: Percentage of all available CPUs to use for this resource pool. Vertica rounds this percentage down to include whole CPU units.
- **NONE** (empty string): No affinity set is assigned to this resource pool. Queries associated with this pool are executed on any CPU.

Default: **NONE**

Important

[CPUAFFINITYSET](#) and [CPUAFFINITYMODE](#) must be set together in the same statement.

EXECUTIONPARALLELISM

Number of threads used to process any single query issued in this resource pool.

```
EXECUTIONPARALLELISM { limit | AUTO }
```

- ***limit***: An integer value between 1 and the number of cores. Setting this parameter to a reduced value increases throughput of short queries issued in the resource pool, especially if queries are executed concurrently.
- **AUTO** or **0**: Vertica calculates the setting from the number of cores, available memory, and amount of data in the system. Unless memory is limited, or the amount of data is very small, Vertica sets this parameter to the number of cores on the node.

Default: **AUTO**

MAXCONCURRENCY

Maximum number of concurrent execution slots available to the resource pool across the cluster:

```
MAXCONCURRENCY { integer | NONE }
```

NONE (empty string): Unlimited number of concurrent execution slots.

Default : **NONE**

MAXMEMORYSIZE

Maximum size per node the resource pool can grow by borrowing memory from the [GENERAL](#) pool:

```
MAXMEMORYSIZE {  
  'integer%'  
  | 'integer{K|M|G|T}'  
  NONE  
}
```

- **integer%** : Percentage of total memory
- **integer {K|M|G|T}** : Amount of memory in kilobytes, megabytes, gigabytes, or terabytes
- **NONE** (empty string): Unlimited, resource pool can borrow any amount of available memory from the [GENERAL](#) pool.

Default : **NONE**

MAXQUERYMEMORYSIZE

Maximum amount of memory this resource pool can allocate at runtime to process a query. If the query requires more memory than this setting, Vertica stops execution and returns an error.

Set this parameter as follows:

```
MAXQUERYMEMORYSIZE {  
  'integer%'  
  | 'integer{K|M|G|T}'  
  | NONE  
}
```

- **integer%** : Percentage of **MAXMEMORYSIZE** for this resource pool.
- **integer {K|M|G|T}** : Amount of memory in kilobytes, megabytes, gigabytes, or terabytes, up to the value of **MAXMEMORYSIZE** .
- **NONE** (empty string): Unlimited; resource pool can borrow any amount of available memory from the [GENERAL](#) pool, within the limits set by **MAXMEMORYSIZE** .

Default : **NONE**

Important

Changes to **MAXQUERYMEMORYSIZE** are applied retroactively to queries that are currently executing. If you reduce this setting, queries that were budgeted with the previous memory size are liable to fail if they try to allocate more memory than the new setting allows.

MEMORYSIZE

Total per-node memory available to the Vertica resource manager that is allocated to this resource pool:

```
MEMORYSIZE {  
  'integer%'  
  | 'integer{K|M|G|T}'  
}
```

- **integer%** : Percentage of total memory
- **integer {K|M|G|T}** : Amount of memory in kilobytes, megabytes, gigabytes, or terabytes

Default: 0%. No memory allocated, the resource pool borrows memory from the [GENERAL](#) pool.

PLANNEDCONCURRENCY

Preferred number of queries to execute concurrently in the resource pool. This setting applies to the entire cluster:

```
PLANNEDCONCURRENCY { num-queries | AUTO }
```

- **num-queries** : Integer value ≥ 1 , the preferred number of queries to execute concurrently in the resource pool. When possible, query resource budgets are limited to allow this level of concurrent execution.
- **AUTO** : Value is calculated automatically at query runtime. Vertica sets this parameter to the lower of these two calculations, but never less than 4:
 - Number of logical cores

- Memory divided by 2GB

If the number of logical cores on each node is different, **AUTO** is calculated differently for each node. Distributed queries run like the minimal effective planned concurrency. Single node queries run with the planned concurrency of the initiator.

Default : **AUTO**

Tip

Change this parameter only after evaluating performance over a period of time.

PRIORITY

Priority of queries in this resource pool when they compete for resources in the **GENERAL** pool:

```
PRIORITY { integer | HOLD }
```

- **integer**: Negative or positive integer value, where higher numbers denote higher priority:
 - User-defined resource pool: **-100** to **100**
 - Built-in resource pools **SYSQUERY**, **RECOVERY**, and **TM**: **-110** to **110**
- **HOLD**: Sets priority to **-999**. Queries in this resource pool are queued until **QUEUETIMEOUT** is reached.

Default : 0

QUEUETIMEOUT

Maximum time a request can wait for pool resources before it is rejected, not more than one year:

```
QUEUETIMEOUT { integer | 'interval' | 'NONE' }
```

- **integer**: Maximum wait time in seconds
- **[interval]/[sql-reference/language-elements/literals/datetime-literals/interval-literal.html]**: Maximum wait time expressed in the following format:

```
num year num months num [days] HH:MM:SS.ms
```
- **NONE** (empty string): No maximum wait time, request can be queued indefinitely, up to one year.

If the value that you specify resolves to more than one year, Vertica returns with a warning and sets the parameter to 365 days:

```
=> ALTER RESOURCE POOL user_0 QUEUETIMEOUT '11 months 50 days 08:32';
WARNING 5693: Using 1 year for QUEUETIMEOUT
ALTER RESOURCE POOL
=> SELECT QUEUETIMEOUT FROM resource_pools WHERE name = 'user_0';
QUEUETIMEOUT
-----
365
(1 row)
```

Default : **00:05 (5 minutes)**

RUNTIMECAP

Maximum execution time allowed to queries in this resource pool, not more than one year, otherwise Vertica returns with an error. If a query exceeds this setting, it tries to cascade to a secondary pool:

```
RUNTIMECAP { 'interval' | NONE }
```

- **interval**: Maximum wait time expressed in the following format:

```
num year num month num [day] HH:MM:SS.ms
```
- **NONE** (empty string): No maximum wait time, request can be queued indefinitely, up to one year.

If the user or session also has a **RUNTIMECAP**, the shorter limit applies.

RUNTIMEPRIORITY

Determines how the resource manager should prioritize dedication of run-time resources (CPU, I/O bandwidth) to queries already running in this resource pool:

```
RUNTIMEPRIORITY { HIGH | MEDIUM | LOW }
```

Default : **MEDIUM**

RUNTIMEPRIORITYTHRESHOLD

Maximum time (in seconds) in which query processing must complete before the resource manager assigns to it the resource pool's **RUNTIMEPRIORITY** . All queries begin execution with a priority of HIGH.

```
RUNTIMEPRIORITYTHRESHOLD seconds
```

Default : **2**

SINGLEINITIATOR

Set to false for backward compatibility. Do not change this setting.

Privileges

Superuser

Examples

Set resource pool PRIORITY to 5:

```
=> ALTER RESOURCE POOL ceo_pool PRIORITY 5;
```

Designate a secondary resource pool:

```
=> CREATE RESOURCE POOL second_pool;  
=> ALTER RESOURCE POOL ceo_pool CASCADE TO second_pool;
```

Decrease to 0% the MAXMEMORYSIZE and MEMORYSIZE settings on the **dashboard** subcluster's built-in [TM resource pool](#) . Changing these settings to 0 prevents the subcluster from running mergeout operations:

```
=> ALTER RESOURCE POOL TM FOR SUBCLUSTER dashboard MEMORYSIZE '0%'  
MAXMEMORYSIZE '0%';
```

See [Tuning tuple mover pool settings](#) for more information.

See also

- [CREATE RESOURCE POOL](#)
- [DROP RESOURCE POOL](#)
- [CREATE USER](#)
- [RESOURCE_POOL_STATUS](#)
- [SET SESSION RESOURCE_POOL](#)
- [SET SESSION MEMORYCAP](#)
- [Managing workloads](#)

ALTER ROLE

Renames an existing [role](#) .

Note

You cannot use ALTER ROLE to rename a role that was added to the Vertica database with the LDAPLink service.

Syntax

```
ALTER ROLE name RENAME TO new-name
```

Parameters

name

The role to rename.

new-name

The role's new name.

Privileges

Superuser

Examples

```
=> ALTER ROLE applicationadministrator RENAME TO appadmin;  
ALTER ROLE
```

See also

- [CREATE ROLE](#)
- [DROP ROLE](#)

ALTER ROUTING RULE

Changes an existing load balancing policy routing rule.

Syntax

```
ALTER ROUTING RULE { rule_name | FOR WORKLOAD workload_name } {  
  RENAME TO new_name |  
  SET ROUTE TO 'cidr_range' |  
  SET GROUP TO group_name |  
  SET WORKLOAD TO workload_name |  
  SET SUBCLUSTER TO subcluster_name [,...] |  
  SET PRIORITY TO priority |  
  { ADD | REMOVE } SUBCLUSTER subcluster_name [,...]  
}
```

Parameters

rule_name

The name of the existing routing rule to change.

FOR WORKLOAD *workload_name*

The name of a [workload](#).

RENAME TO *new_name*

The new name of the routing rule.

SET ROUTE TO ' *cidr_range* '

An IPv4 or IPv6 address range in CIDR format. Changes the address range of client connections this rule applies to.

SET GROUP TO *group_name*

The load balancing group that handles the connections that match this rule.

SET WORKLOAD TO *workload_name*

The name of the [workload](#).

SET SUBCLUSTER TO *subcluster_name*

One or more subclusters to [route](#) clients to.

SET PRIORITY TO *priority*

Sets the priority for the routing rule, where *priority* is a non-negative [INTEGER](#). The greater the value, the greater the priority. If a user or their role is [granted](#) multiple [routing rules](#), the one with the greatest priority applies. You can set the priority for a routing rule only when applying a routing rule to a workload.

{ADD | REMOVE} SUBCLUSTER *subcluster_name*

Add or remove one or more subclusters from the routing rule.

Examples

This example changes the routing rule named `etl_rule` so it uses the load balancing group named `etl_rule` to handle incoming connections in the IP address range of 10.20.100.0 to 10.20.100.255.

```
=> ALTER ROUTING RULE etl_rule SET GROUP TO etl_group;
ALTER ROUTING RULE
=> ALTER ROUTING RULE etl_rule SET ROUTE TO '10.20.100.0/24';
ALTER ROUTING RULE
=> \x
Expanded display is on.
=> SELECT * FROM routing_rules WHERE NAME = 'etl_rule';
-[ RECORD 1 ]-----+-----
name          | etl_rule
source_address | 10.20.100.0/24
destination_name | etl_group
```

This example routes **analytics** workloads to the **sc_analytics_2** subcluster:

```
=> ALTER ROUTING RULE FOR WORKLOAD analytics SET SUBCLUSTER TO 'sc_analytics_2';
```

This example changes the workload rule to handle **reporting** instead of **analytics** workloads:

```
=> ALTER ROUTING RULE FOR WORKLOAD analytics SET WORKLOAD TO reporting;
```

This example changes the priority of the workload rule for **reporting** workloads:

```
=> ALTER ROUTING RULE FOR WORKLOAD reporting SET PRIORITY TO 5;
```

This example adds a subcluster to the routing rule:

```
=> ALTER ROUTING RULE FOR WORKLOAD analytics ADD SUBCLUSTER sc_01, sc_02;
```

This example removes a subcluster from the routing rule:

```
=> ALTER ROUTING RULE FOR WORKLOAD analytics REMOVE SUBCLUSTER sc_01, sc_02;
```

See also

- [CREATE ROUTING RULE](#)
- [DROP ROUTING RULE](#)

ALTER SCHEDULE

Modifies a [schedule](#).

Syntax

```
ALTER SCHEDULE [[database.]schema.]schedule {
    OWNER TO new_owner
    | SET SCHEMA new_schema
    | RENAME TO new_schedule
    | USING CRON new_cron_expression
    | USING DATETIMES new_timestamp_list
}
```

Arguments

[database.] schema

Database and [schema](#). The default schema is **public**. If you specify a database, it must be the current database.

schedule

The schedule to modify.

new_owner

The new owner of the schedule.

new_schema

The new schema of the schedule.

new_schedule

The new name for the schedule.

new_cron_expression

A **cron** expression. You should use this for recurring tasks. Value separators are not currently supported.

new_timestamp_list

A comma-separated list of timestamps. You should use this to schedule non-recurring events at arbitrary times.

Privileges

Superuser

Examples

To change the **cron** expression for a schedule:

```
=> ALTER SCHEDULE daily_schedule USING CRON '0 8 * * *';
```

To change a schedule that uses a **cron** expression to use a timestamp list instead:

```
=> ALTER SCHEDULE my_schedule USING DATETIMES('2023-10-01 12:30:00', '2022-11-01 12:30:00');
```

To rename a schedule:

```
=> ALTER SCHEDULE daily_schedule RENAME TO daily_8am_gmt;
```

ALTER SCHEMA

Changes one or more schemas in one of the following ways:

- Enable or disable inheritance of schema privileges by tables created in the schemas.
- Reassign schema ownership to another user.
- Change schema disk quota.
- Rename one or more schemas.

Syntax

```
ALTER SCHEMA [{ namespace. | database. }]schema
  DEFAULT {INCLUDE | EXCLUDE} SCHEMA PRIVILEGES
  | OWNER TO user-name [CASCADE]
  | DISK_QUOTA { value | SET NULL }
```

You can rename more than one schema in a single operation:

```
ALTER SCHEMA [{ namespace. | database. }]schema[,...] RENAME TO [namespace.]new-schema-name[,...]
```

Parameters

namespace

For Eon Mode databases, [namespace](#) of the schema to alter. If no namespace is specified, the namespace of the schema is assumed to be [default_namespace](#) .

database

For Enterprise Mode databases, name of the database containing the schema. If specified, it must be the current database.

schema

Name of the schema to modify.

DEFAULT {INCLUDE | EXCLUDE} SCHEMA PRIVILEGES

Specifies whether to enable or disable default inheritance of privileges for new tables in the specified schema:

- **EXCLUDE SCHEMA PRIVILEGES** (default): Disables inheritance of schema privileges.
- **INCLUDE SCHEMA PRIVILEGES** : Specifies to grant tables in the specified schema the same privileges granted to that schema. This option has no effect on existing tables in the schema.

See also [Enabling schema inheritance](#).

OWNER TO

Reassigns schema ownership to the specified user:

```
OWNER TO user-name [CASCADE]
```

By default, ownership of objects in the reassigned schema remain unchanged. To reassign ownership of schema objects to the new schema owner, qualify the OWNER TO clause with CASCADE . For details, see [Cascading Schema Ownership](#) below.

DISK_QUOTA

One of the following:

- A string, an integer followed by a supported unit: K, M, G, or T. If the new value is smaller than the current usage, the operation succeeds but no further disk space can be used until usage is reduced below the new quota.
- SET NULL to remove a quota.

For more information, see [Disk quotas](#).

RENAME TO

Renames one or more schemas:

```
RENAME TO [namespace.]new-schema-name[,...]
```

The following requirements apply:

- The new schema name conforms to conventions described in [Identifiers](#). It must also be unique among all names of sequences, tables, projections, views, models, and schemas in the namespace.
- If you specify multiple schemas to rename, the source and target lists must have the same number of names.
- If you specified the *namespace* of the schema to alter, you must provide the same namespace for the *new-schema-name*. You cannot rename a schema to a different namespace.

Caution

Renaming a schema referenced by a view causes the view to fail unless another schema is created to replace it.

Privileges

One of the following:

- Superuser
- Schema owner

Cascading schema ownership

By default, ALTER SCHEMA...OWNER TO does not affect ownership of objects in the target schema or the privileges granted on them. If you qualify the OWNER TO clause with CASCADE, Vertica acts as follows on objects in the target schema:

- Transfers ownership of objects owned by the previous schema owner to the new owner.
- Revokes all object privileges granted by the previous schema owner.

If issued by non-superusers, ALTER SCHEMA...OWNER TO CASCADE ignores all objects that belong to other users, and returns with notices on the objects that it cannot change. For example:

1. Schema *ms* is owned by user *mayday*, and contains two tables: *ms.t1* owned by *mayday*, and *ms.t2* owned by user *joe*:

```
=> \dt
      List of tables
 Schema | Name | Kind | Owner | Comment
-----+-----+-----+-----+-----
 ms     | t1   | table | mayday |
 ms     | t2   | table | joe   |
```

2. User *mayday* transfers ownership of schema *ms* to user *dbadmin*, using CASCADE. On return, ALTER SCHEMA reports that it cannot transfer ownership of table *ms.t2* and its projections, which are owned by user *joe*:

```

=> \c - mayday
You are now connected as user "mayday".
=> ALTER SCHEMA ms OWNER TO dbadmin CASCADE;
NOTICE 3583: Insufficient privileges on ms.t2
NOTICE 3583: Insufficient privileges on ms.t2_b0
NOTICE 3583: Insufficient privileges on ms.t2_b1
ALTER SCHEMA
=> \c
You are now connected as user "dbadmin".
=> \dt

```

List of tables				
Schema	Name	Kind	Owner	Comment
ms	t1	table	dbadmin	
ms	t2	table	joe	

3. User **dbadmin** transfers ownership of schema **ms** to user **pat** , again using **CASCADE** . This time, because **dbadmin** is a superuser, **ALTER SCHEMA** transfers ownership of all **ms** tables to user **pat**

```

=> ALTER SCHEMA ms OWNER TO pat CASCADE;
ALTER SCHEMA
=> \dt

```

List of tables				
Schema	Name	Kind	Owner	Comment
ms	t1	table	pat	
ms	t2	table	pat	

Swapping schemas

Renaming schemas is useful for swapping schemas without actually moving data. To facilitate the swap, enter a non-existent, temporary placeholder schema. For example, the following **ALTER SCHEMA** statement uses the temporary schema **temps** to facilitate swapping schema **S1** with schema **S2**. In this example, **S1** is renamed to **temps** . Then **S2** is renamed to **S1** . Finally, **temps** is renamed to **S2** .

```

-> ALTER SCHEMA S1, S2, temps RENAME TO temps, S1, S2;

```

Examples

The following example renames schemas **S1** and **S2** to **S3** and **S4** , respectively:

```

-> ALTER SCHEMA S1, S2 RENAME TO S3, S4;

```

This example sets the default behavior for new table **t2** to automatically inherit the schema's privileges:

```

-> ALTER SCHEMA s1 DEFAULT INCLUDE SCHEMA PRIVILEGES;
-> CREATE TABLE s1.t2 (i, int);

```

This example sets the default for new tables to not automatically inherit privileges from the schema:

```

-> ALTER SCHEMA s1 DEFAULT EXCLUDE SCHEMA PRIVILEGES;

```

In an Eon Mode database, the following statement renames the **train** schema to **ferry** in the **transit** namespace:

```

-> ALTER SCHEMA transit.train RENAME TO transit.ferry;

```

See also

- [CREATE SCHEMA](#)
- [DROP SCHEMA](#)

ALTER SEQUENCE

Changes a sequence in two ways:

- Changes values that control sequence behavior—for example, its start value and range of minimum and maximum values. These changes take effect only when you start a new database session.

- Changes sequence name, schema, or ownership. These changes take effect immediately.

Syntax

Change sequence behavior:

```
ALTER SEQUENCE [[database.]schema.]sequence
 [ INCREMENT [ BY ] integer ]
 [ MINVALUE integer | NO MINVALUE ]
 [ MAXVALUE integer | NO MAXVALUE ]
 [ RESTART [ WITH ] integer ]
 [ CACHE integer | NO CACHE ]
 [ CYCLE | NO CYCLE ]
```

Change sequence name, schema, or ownership:

```
ALTER SEQUENCE [schema.]sequence-name {
  RENAME TO name
 | SET SCHEMA schema]
 | OWNER TO owner
}
```

Arguments

[***database.***] ***schema***

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

sequence

Name of the sequence to alter.

In the case of IDENTITY table columns, Vertica generates the sequence name using the following convention:

```
table-name_col-name_seq
```

To obtain this name, query the [SEQUENCES](#) system table.

INCREMENT *integer*

Positive or negative minimum value change on each call to [NEXTVAL](#). The default is 1.

This value is a minimum increment size. The sequence can increment by more than this value unless you also specify **NO CACHE**.

MINVALUE *integer* | NO MINVALUE

Minimum value the sequence can generate. If this change would invalidate the current sequence position, the operation fails.

MAXVALUE *integer* | NO MAXVALUE

Maximum value the sequence can generate. If this change would invalidate the current sequence position, the operation fails.

RESTART *integer*

New start value of the sequence. The next call to [NEXTVAL](#) returns the new start value.

Caution

Using ALTER SEQUENCE to set a sequence start value below its [current value](#) can result in duplicate keys.

CACHE | NO CACHE

How many unique sequence numbers to pre-allocate and store in memory on each node for faster access. Vertica sets up caching for each session and distributes it across all nodes. A value of 0 or 1 is equivalent to **NO CACHE**.

Caution

If sequence caching is set to a low number, nodes might request a new set of cache values more frequently. While it supplies a new cache, Vertica must lock the catalog. Until Vertica releases the lock, other database activities such as table inserts are blocked, which can adversely affect overall performance.

By default, the sequence cache is set to 250,000.

For details, see [Distributing sequences](#).

CYCLE | NO CYCLE

How to handle reaching the end of the sequence. The default is **NO CYCLE**, meaning that a call to [NEXTVAL](#) returns an error after the sequence reaches its upper or lower limit. **CYCLE** instead wraps, as follows:

- Ascending sequence: wraps to the minimum value.
- Descending sequence: wraps to the maximum value.

RENAME TO *name*

New name in the current schema for the sequence. Supported only for [named sequences](#).

SET SCHEMA *schema*

Moves the sequence to a new schema. Supported only for named sequences.

OWNER TO *owner*

Reassigns sequence ownership to another user.

Privileges

For [named sequences](#), USAGE on the schema and one of the following:

- Sequence owner
- ALTER privilege on the sequence
- For certain operations, non-superusers must have the following schema privileges:
 - To rename a sequence: CREATE, USAGE
 - To move a sequence to another schema: CREATE on the destination, USAGE on the source

For [IDENTITY](#) column sequences, USAGE on the table schema and one of the following:

- Table owner
- ALTER privileges

Non-superusers must also have SELECT privileges to enable or disable [constraint enforcement](#), or remove partitioning.

Examples

See [Altering sequences](#).

See also

[CREATE SEQUENCE](#)

[ALTER SESSION](#)

[ALTER SESSION](#) sets and clears session-level configuration parameter values for the current session. To identify session-level parameters, query the [CONFIGURATION_PARAMETERS](#) system table.

Syntax

```
ALTER SESSION {  
  SET [PARAMETER] parameter=value[,...]  
  | CLEAR { [PARAMETER] parameter[,...] | PARAMETER ALL }  
  | SET UDPARAMETER [ FOR libname ] ud-parameter=value[,...]  
  | CLEAR UDPARAMETER { [ FOR libname ] ud-parameter[,...] | ALL }  
}
```

Arguments

SET [PARAMETER] *parameter* = *value*

Sets one or more configuration parameters to the specified value.

CLEAR { [PARAMETER] *parameter* | PARAMETER ALL }

Clears the specified configuration parameters, or all parameters, of changes that were set in the current session.

SET UDPARAMETER [FOR *libname*] *ud-parameter* = *value* [...]

Sets one or more [user-defined session parameters](#) to be used with UDxs. The maximum length of a parameter name when set with ALTER SESSION is 128 characters.

If you specify a library, then only that library can access the parameter's value. Use this restriction to protect parameters that hold sensitive data, such as credentials.

CLEAR UDPARAMETER { [FOR *libname*] *ud-parameter* [...] | ALL }

Clears the specified user-defined parameters, or all of them, of changes that were set in the current session.

Privileges

None

Examples

Set a configuration parameter:

```
=> ALTER SESSION SET ForceUDxFencedMode = 1;
ALTER SESSION

=> SELECT parameter_name, current_value, default_value
   FROM CONFIGURATION_PARAMETERS
   WHERE parameter_name = 'ForceUDxFencedMode';
 parameter_name | current_value | default_value
-----+-----+-----
ForceUDxFencedMode | 1           | 0
(1 row)
```

Clear all session-level settings for configuration parameters:

```
=> ALTER SESSION CLEAR PARAMETER ALL;
ALTER SESSION
```

Set a UDX parameter in a single library:

```
=> ALTER SESSION SET UDPARAMETER FOR MyLibrary RowCount = 25;
ALTER SESSION
```

ALTER SUBCLUSTER

Changes the configuration of a subcluster. You can use this statement to rename a subcluster or make it the [default subcluster](#).

Syntax

```
ALTER SUBCLUSTER subcluster-name {
  RENAME TO new-name |
  SET DEFAULT
}
```

Parameters

subcluster-name

The name of the subcluster to alter.

RENAME TO *new-name*

Changes the name of the subcluster to *new-name*.

SET DEFAULT

Makes the subcluster the default subcluster. When you add new nodes to the database and do not specify a subcluster to contain them, Vertica adds them to the default subcluster. There can be only one default subcluster at a time. The subcluster that was previously the default subcluster becomes a non-default subcluster.

Privileges

Superuser

Examples

This example makes the `analytics_cluster` the default subcluster:

```
=> SELECT DISTINCT subcluster_name FROM SUBCLUSTERS WHERE is_default = true;
subcluster_name
-----
default_subcluster
(1 row)

=> ALTER SUBCLUSTER analytics_cluster SET DEFAULT;
ALTER SUBCLUSTER
=> SELECT DISTINCT subcluster_name FROM SUBCLUSTERS WHERE is_default = true;
subcluster_name
-----
analytics_cluster
(1 row)
```

This example renames default_subcluster to load_subcluster:

```
=> ALTER SUBCLUSTER default_subcluster RENAME TO load_subcluster;
ALTER SUBCLUSTER

=> SELECT DISTINCT subcluster_name FROM subclusters;
subcluster_name
-----
load_subcluster
analytics_cluster
(2 rows)
```

See also

- [CRITICAL_SUBCLUSTERS](#)
- [DEMOTE_SUBCLUSTER_TO_SECONDARY](#)
- [PROMOTE_SUBCLUSTER_TO_PRIMARY](#)
- [SHUTDOWN_SUBCLUSTER](#)
- [SUBCLUSTERS](#)

ALTER SUBNET

Renames an existing subnet.

Syntax

```
ALTER SUBNET subnet-name RENAME TO new-subnet-name
```

Parameters

subnet-name

The name of the existing subnet.

new-subnet-name

The new name for the subnet.

Privileges

Superuser

Examples

```
=> ALTER SUBNET mysubnet RENAME TO myNewSubnet;
```

ALTER TABLE

Modifies the metadata of an existing table. All changes are auto-committed.

Syntax

```

ALTER TABLE [{ namespace. | database. } ]schema.table {
  ADD COLUMN [ IF NOT EXISTS ] column datatype
    [ column-constraint ]
    [ ENCODING encoding-type ]
    [ PROJECTIONS (projections-list) | ALL PROJECTIONS ]
    [, ...]
| ADD table-constraint
| ALTER COLUMN column {
  ENCODING encoding-type PROJECTIONS (projection-list)
  [ { SET | DROP } expression ]
| ALTER CONSTRAINT constraint-name { ENABLED | DISABLED }
| DISK_QUOTA { value | SET NULL }
| DROP CONSTRAINT constraint-name [ CASCADE | RESTRICT ]
| DROP [ COLUMN ] [ IF EXISTS ] column [ CASCADE | RESTRICT ]
| FORCE OUTER integer
| { INCLUDE | EXCLUDE | MATERIALIZE } [ SCHEMA ] PRIVILEGES
| OWNER TO owner
| partition-clause [ REORGANIZE ]
| REMOVE PARTITIONING
| RENAME [ COLUMN ] name TO new-name
| RENAME TO new-table-name[,...]
| REORGANIZE
| SET {
  ActivePartitionCount { count | DEFAULT }
  | IMMUTABLE ROWS
  | MERGEOUT { 1 | 0 }
  | SCHEMA [namespace.]schema }
}

```

Note

Several ALTER TABLE clauses cannot be specified with other clauses in the same statement (see [Exclusive ALTER TABLE Clauses](#) below). Otherwise, ALTER TABLE supports multiple comma-delimited clauses. For example, the following ALTER TABLE statement changes the `my_table` table in two ways: reassigns ownership to `Joe` , and sets a UNIQUE constraint on the `b` column:

```

=> ALTER TABLE my_table OWNER TO Joe,
  ADD CONSTRAINT unique_b UNIQUE (b) ENABLED;

```

Arguments

namespace

For Eon Mode databases, [namespace](#) that contains the table to alter. If no namespace is specified, the namespace of the table is assumed to be `default_namespace` .

database

For Enterprise Mode databases, name of the database containing the table. If specified, it must be the current database.

schema

Name of the schema that contains the table to alter.

table

The table to alter.

ADD COLUMN

Adds one or more columns to the table and to the specified projections (or all projections, if not specified).

Adding a column with the same name as one that already exists is an error unless you use IF NOT EXISTS. [Restrictions on columns of complex types](#) also apply to columns that you add using ADD COLUMN.

You can qualify the new column definition with one or more of these options:

- A column constraint:

```
[ CONSTRAINT constraint-name ]
{ [NOT] NULL
  | DEFAULT expression
  | SET USING expression
  | DEFAULT USING expression }
```

Columns that use DEFAULT with static values can be added in a single ALTER TABLE statement. Columns that use non-static DEFAULT values must be added in separate ALTER TABLE statements. For more information, see [Column-constraint](#).

- **ENCODING** : the column [encoding type](#), by default **AUTO**.
- **PROJECTIONS** : a comma-separated list of [base names](#) of existing projections to add the column to. Vertica adds the column to all buddies of each projection. The projection list cannot include projections with [pre-aggregated data](#) such as live aggregate projections. Instead of specifying projections, you can use **ALL PROJECTIONS** to add the column to all projections, excluding those with pre-aggregated data.

ADD [table-constraint](#)

Adds a [constraint](#) to a table that does not have any associated projections.

ALTER COLUMN

You can alter an existing column in one of two ways:

- Set encoding on a column for one or more projections of this table:

```
ENCODING encoding-type PROJECTIONS (projections-list)
```

where *projections-list* is a comma-delimited list of projections to update with the new encoding. You can specify each projection in two ways:

- Projection base name: Update all projections that share this base name.
- Projection name: Update the specified projection. If the projection is segmented, the change is propagated to all buddies.

If one of the projections does not contain the target column, Vertica returns with a rollback error.

For details, see [Projection Column Encoding](#).

- Set or drop a setting for a column of scalar data, including primitive arrays:

```
SET { DEFAULT expression
      | USING expression
      | DEFAULT USING expression
      | NOT NULL
      | DATA TYPE datatype
}
DROP { DEFAULT
      | SET USING
      | DEFAULT USING
      | NOT NULL
}
```

You cannot change the data type of a column of any complex type that is neither a scalar type nor an array of scalar types. One exception applies: in external tables, you can change a primitive column type to a complex type.

Setting a DEFAULT or SET USING expression has no effect on existing column values. To refresh the column with its DEFAULT or SET USING expression, update it as follows

- SET USING column: Call [REFRESH_COLUMNS](#) on the table.
- DEFAULT column: update the column as follows:

```
UPDATE table-name SET column-name=DEFAULT;
```

Altering a column with DEFAULT or SET USING can increase disk usage, which can cause the operation to fail if it would violate the table or schema disk quota.

ALTER CONSTRAINT

Specifies whether to [enforce](#) primary key, unique key, and check constraints:

```
ALTER CONSTRAINT constraint-name {ENABLED | DISABLED}
```

DISK_QUOTA

One of the following:

- A string, an integer followed by a supported unit: K, M, G, or T. If the new value is smaller than the current usage, the operation succeeds but no further disk space can be used until usage is reduced below the new quota.
- SET NULL to remove a quota.

For more information, see [Disk quotas](#).

DROP CONSTRAINT

Drops the specified table constraint from the table:

```
DROP CONSTRAINT constraint-name [CASCADE | RESTRICT]
```

You can qualify DROP CONSTRAINT with one of these options:

- CASCADE : Drops a constraint and all dependencies in other tables.
- RESTRICT : Does not drop a constraint if there are dependent objects. Same as the default behavior.

Dropping a table constraint has no effect on views that reference the table.

DROP [COLUMN]

Drops the specified column from the table and that column's ROS containers:

```
DROP [COLUMN] [IF EXISTS] column [CASCADE | RESTRICT]
```

You can qualify DROP COLUMN with one of these options:

- IF EXISTS generates an informational message if the column does not exist. If you omit this option and the column does not exist, Vertica generates a ROLLBACK error message.
- CASCADE is required if the column has dependencies.
- RESTRICT drops the column only from the given table.

The column's table cannot be [immutable](#).

See [Dropping table columns](#).

FORCE OUTER *integer*

Specifies whether a table is joined to another as an inner or outer input. For details, see [Controlling join inputs](#).

{INCLUDE | EXCLUDE | MATERIALIZE} [SCHEMA] PRIVILEGES

Specifies default inheritance of schema privileges for this table:

- EXCLUDE PRIVILEGES (default) disables inheritance of privileges from the schema.
- INCLUDE PRIVILEGES grants the table the same privileges granted to its schema.
- MATERIALIZE PRIVILEGES copies grants to the table and creates a GRANT object on the table. This disables the inherited privileges flag on the table, so you can:
 - Grant more specific privileges at the table level.
 - Use schema-level privileges as a template.
 - Move the table to a different schema.
 - Change schema privileges without affecting the table.

Note

If [inherited privileges are disabled at the database level](#), schema privileges can still be materialized.

See also [Setting privilege inheritance on tables and views](#).

OWNER TO *owner*

[Changes the table owner](#).

[partition-clause](#) [REORGANIZE]

Invalid for external tables, logically divides table data storage through a PARTITION BY clause:

```
PARTITION BY expression  
[ GROUP BY expression ]  
[ SET ACTIVEPARTITIONCOUNT integer ]
```

For details, see [Partition clause](#).

If you qualify the partition clause with REORGANIZE and the table previously specified no partitioning, the Vertica [Tuple Mover](#) immediately implements the partition clause. If the table previously specified partitioning, the Tuple Mover evaluates ROS storage containers and reorganizes them as needed to conform with the new partition clause.

REMOVE PARTITIONING

Specifies to remove partitioning from a table definition. The [Tuple Mover](#) subsequently removes existing partitions from ROS containers.

RENAME [COLUMN]

[Renames](#) the specified column within the table. The column's table cannot be [immutable](#).

RENAME TO

Renames one or more tables:

```
RENAME TO new-table-name[,...]
```

The following requirements apply:

- The renamed table must be in the same schema as the original table.
- The new table name conforms to conventions described in [Identifiers](#). It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
- If you specify multiple tables to rename, the source and target lists must have the same number of names.

REORGANIZE

Valid only for partitioned tables, invokes the [Tuple Mover](#) to reorganize ROS storage containers as needed to conform with the table's current partition clause. ALTER TABLE...REORGANIZE and Vertica meta-function [PARTITION_TABLE](#) operate identically.

REORGANIZE can also qualify a new [partition clause](#).

SET

Changes a table setting, one of the following:

- ActivePartitionCount { *count* | DEFAULT }, valid only for partitioned tables, specifies how many partitions are active for this table, one of the following:
 - *count*: Unsigned integer, supersedes configuration parameter [ActivePartitionCount](#).
 - DEFAULT: Removes the table-level active partition count. The table obtains its active partition count from the configuration parameter ActivePartitionCount.

For details on usage, see [Active and inactive partitions](#).

- IMMUTABLE ROWS prevents changes to table row values by blocking DML operations such as UPDATE and DELETE. Once set, table immutability cannot be reverted. You cannot set a [flattened table](#) to be immutable. For details on all immutable table restrictions, see [Immutable tables](#).
- MERGEOUT { 1 | 0 } specifies whether to enable or [disable mergeout](#) to ROS containers that consolidate projection data of this table. By default, mergeout is enabled (1) on all tables.
- SCHEMA [*namespace.*] *schema-name* moves the table from its current schema to [*namespace.*] *schema-name*. For Eon Mode databases, the new schema must be in the same namespace as the old schema. When no *namespace* is provided, the namespace is set to [default_namespace](#).

Vertica automatically moves all projections that are anchored to the source table to the destination schema. It also moves all [IDENTITY](#) columns to the destination schema. For details, see [Moving tables to another schema](#)

Privileges

Non-superuser: USAGE on the schema and one of the following:

- Table owner
- ALTER privileges

Non-superusers must also have SELECT privileges to enable or disable [constraint enforcement](#), or remove partitioning.

For certain operations, non-superusers must have the following schema privileges:

- To rename a table: CREATE, USAGE
- To move a table to another schema: USAGE on the source schema, CREATE on the destination schema

Restrictions for complex types

Complex types used in native tables have some restrictions, in addition to the restrictions for individual types listed on their reference pages:

- A native table must have at least one column that is a primitive type or a native array (one-dimensional array of a primitive type). If a flex table has real columns, it must also have at least one column satisfying this restriction.
- Complex type columns cannot be used in ORDER BY or PARTITION BY clauses nor as FILLER columns.
- Complex type columns cannot have [constraints](#).
- Complex type columns cannot use DEFAULT or SET USING.
- Expressions returning complex types cannot be used as projection columns, and projections cannot be segmented or ordered by columns of complex types.

Exclusive ALTER TABLE clauses

The following ALTER TABLE clauses cannot be combined with another ALTER TABLE clause:

- ADD COLUMN
- DROP COLUMN
- RENAME COLUMN
- SET SCHEMA
- RENAME [TO]

Node down limitations

Enterprise Mode only

The following ALTER TABLE operations are not supported when one or more database cluster nodes are down:

- ALTER COLUMN ... ADD [table-constraint](#)
- ALTER COLUMN ... SET DATA TYPE
- ALTER COLUMN ... { SET DEFAULT | DROP DEFAULT }
- ALTER COLUMN ... { SET USING | DROP SET USING }
- ALTER CONSTRAINT
- DROP COLUMN
- DROP CONSTRAINT

Pre-aggregated projection restrictions

You cannot modify the metadata of anchor table columns that are included in [live aggregate](#) or [Top-K](#) projections. You also cannot drop these columns. To make these changes, you must first [drop](#) all live aggregate and Top-K projections that are associated with it.

External table restrictions

Not all ALTER TABLE options pertain to external tables. For instance, you cannot add a column to an external table, but you can rename the table:

```
=> ALTER TABLE mytable RENAME TO mytable2;  
ALTER TABLE
```

Locked tables

If the operation cannot obtain an [O lock](#) on the target table, Vertica tries to close any internal [Tuple Mover](#) sessions that are running on that table. If successful, the operation can proceed. Explicit Tuple Mover operations that are running in user sessions do not close. If an explicit Tuple Mover operation is running on the table, the operation proceeds only when the operation is complete.

Examples

In an Eon Mode database, the following statement alters the schema of the [flights](#) table from schema [airline1](#) in namespace [airport](#) to schema [airline2](#) in namespace [airport](#) :

```
=> ALTER TABLE airport.airline1.flights SET SCHEMA airport.airline2.flights;
```

See also

- [Working with native tables](#)
- [Altering table definitions](#)
- [Adding table columns](#)

In this section

- [Projection column encoding](#)

Projection column encoding

After you create a table and its projections, you can call [ALTER TABLE...ALTER COLUMN](#) to set or change the [encoding type](#) of an existing column in one or more projections. For example:

```
ALTER TABLE store.store_dimension ALTER COLUMN store_region  
ENCODING rle PROJECTIONS (store.store_dimension_p1_b0, store.store_dimension_p2);
```

In this example, the ALTER TABLE statement specifies to set RLE encoding on column [store_region](#) for two projections: [store_dimension_p1_b0](#) and [store_dimension_p2](#) . The [PROJECTIONS](#) list references the two projections by their projection name and base name, respectively. You can reference a projection either way; in both cases, the change is propagated to all buddies of the projection and stored in its DDL accordingly:

```
=> select export_objects('store.store_dimension');
```

```
export_objects
```

```
-----  
CREATE TABLE store.store_dimension
```

```
(  
  store_key int NOT NULL,  
  store_name varchar(64),  
  store_number int,  
  store_address varchar(256),  
  store_city varchar(64),  
  store_state char(2),  
  store_region varchar(64)
```

```
);
```

```
CREATE PROJECTION store.store_dimension_p1
```

```
(  
  store_key,  
  store_name,  
  store_number,  
  store_address,  
  store_city,  
  store_state,  
  store_region ENCODING RLE
```

```
)  
AS
```

```
SELECT store_dimension.store_key,  
       store_dimension.store_name,  
       store_dimension.store_number,  
       store_dimension.store_address,  
       store_dimension.store_city,  
       store_dimension.store_state,  
       store_dimension.store_region
```

```
FROM store.store_dimension
```

```
ORDER BY store_dimension.store_key
```

```
SEGMENTED BY hash(store_dimension.store_key) ALL NODES KSAFE 1;
```

```
CREATE PROJECTION store.store_dimension_p2
```

```
(  
  store_key,  
  store_name,  
  store_number,  
  store_address,  
  store_city,  
  store_state,  
  store_region ENCODING RLE
```

```
)  
AS
```

```
SELECT ...
```

Important

When you add or change a column's encoding type, it has no immediate effect on existing projection data. Vertica applies the encoding only to newly loaded data, and to existing data on [mergeout](#).

ALTER TLS CONFIGURATION

Alters a specified TLS Configuration object. For information on existing TLS Configuration objects, query [TLS_CONFIGURATIONS](#).

Syntax

```
ALTER TLS CONFIGURATION tls_config_name {
  [ CERTIFICATE { NULL | cert_name } ]
  [ ADD CA CERTIFICATES ca_cert_name [...]]
  [ REMOVE CA CERTIFICATES ca_cert_name [...]]
  [ CIPHER SUITES { " | 'openssl_cipher' [...]} ]
  [ TLSMODE 'tlsmode' ]
  [ OWNER TO user_name ]
}
```

Parameters

tls_config_name

The TLS Configuration object to alter.

NULL

Removes the non-CA certificate from the TLS Configuration.

cert_name

A certificate created with [CREATE CERTIFICATE](#).

You must have USAGE privileges on the certificate (either from ownership of the [certificate](#) or [USAGE on its key](#), if any) to add it to a TLS Configuration.

ca_cert_name

A CA certificate created with [CREATE CERTIFICATE](#).

You must have USAGE privileges on the certificate (either from ownership of the [certificate](#) or [USAGE on its key](#), if any) to add it to a TLS Configuration.

openssl_cipher

A comma-separated list of cipher suites to use instead of the default set of cipher suites. Providing an empty string for this parameter clears the alternate cipher suite list and instructs the specified TLS Configuration to use the default set of cipher suites.

To view enabled cipher suites, use [LIST_ENABLED_CIPHERS](#).

tlsmode

How Vertica establishes TLS connections and handles certificates, one of the following, in order of ascending security:

- **DISABLE** : Disables TLS. All other options for this parameter enable TLS.
- **ENABLE** : Enables TLS. Vertica does not check client certificates.
- **TRY_VERIFY** : Establishes a TLS connection if one of the following is true:
 - the other host presents a valid certificate
 - the other host doesn't present a certificate

If the other host presents an invalid certificate, the connection will use plaintext.

- **VERIFY_CA** : Connection succeeds if Vertica verifies that the other host's certificate is from a trusted CA. If the other host does not present a certificate, the connection uses plaintext.
- **VERIFY_FULL** : Connection succeeds if Vertica verifies that the other host's certificate is from a trusted CA and the certificate's **cn** (Common Name) or **subjectAltName** attribute matches the hostname or IP address of the other host.

Note that for client certificates, **cn** is used for the username, so **subjectAltName** must match the hostname or IP address of the other host.

VERIFY_FULL is unsupported for client-server TLS (the connection type handled by `ServerTLSConfig`) and behaves like **VERIFY_CA**.

Note

Whether Vertica or the other party acts as the client or server depends on the type of connection. For connections between the Vertica database and an LDAP server for LDAP Link or LDAP authentication, the Vertica database is the client and the LDAP server is the server:

- [LDAPLinkTLSConfig](#)
- [LDAPAuthTLSConfig](#)

For all other connection types, Vertica is the server and the other party is the client:

- [ServerTLSConfig](#)
- [InternodeTLSConfig](#) (the other Vertica nodes are both the client and server)

Privileges

Non-superuser: [ALTER privileges](#) on the TLS Configuration.

Examples

To remove all certificates and CA certificates from the LDAPLink TLS Configuration:

```
=> SELECT * FROM tls_configurations WHERE name='LDAPLink';
 name | owner | certificate | ca_certificate | cipher_suites | mode
-----+-----+-----+-----+-----+-----
LDAPLink | dbadmin | server_cert | ca          |              | DISABLE
LDAPLink | dbadmin | server_cert | ica        |              | DISABLE
(2 rows)

=> ALTER TLS CONFIGURATION LDAPLink CERTIFICATE NULL REMOVE CA CERTIFICATES ca, ica;
ALTER TLS CONFIGURATION

=> SELECT * FROM tls_configurations WHERE name='LDAPLink';
 name | owner | certificate | ca_certificate | cipher_suites | mode
-----+-----+-----+-----+-----+-----
LDAPLink | dbadmin |              |              |              | DISABLE
(3 rows)
```

To use an alternate set of cipher suites for client-server TLS:

```
=> ALTER TLS CONFIGURATION server CIPHER SUITES
 'DHE-PSK-AES256-CBC-SHA384,
  DHE-PSK-AES128-GCM-SHA256,
  PSK-AES128-CBC-SHA256';
ALTER TLS CONFIGURATION

=> SELECT name, cipher_suites FROM tls_configurations WHERE name='server';
 name | cipher_suites
-----+-----
server | DHE-PSK-AES256-CBC-SHA384,DHE-PSK-AES128-GCM-SHA256,PSK-AES128-CBC-SHA256
(1 row)
```

For other examples, see:

- [Configuring client-server TLS](#)
- [TLS for LDAP link](#)
- [TLS for LDAP authentication](#)
- [Internode TLS](#)

ALTER TRIGGER

Modifies a [trigger](#).

Syntax

```
ALTER TRIGGER [[database.]schema.]trigger {
    OWNER TO new_owner
  | SET SCHEMA new_schema
  | RENAME TO new_trigger
  | PROCEDURE TO new_procedure
}
```

Parameters

[*database.*] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

trigger

The trigger to modify.

new_owner

The new owner and definer of the trigger. This affects the behavior of [AS DEFINER](#).

new_schema

The new schema of the trigger.

new_trigger

The new name for the trigger.

new_procedure

The function signature of the [stored procedure](#).

Privileges

Superuser

Examples

To attach a different procedure to the trigger:

```
=> ALTER TRIGGER daily_1am PROCEDURE TO log_user_actions(10, 20);
```

To rename a trigger:

```
=> ALTER TRIGGER daily_1am RENAME TO daily_1am_gmt;
```

To move the trigger to a different schema:

```
=> ALTER TRIGGER daily_1am_gmt
```

ALTER USER

Changes user account parameters and user-level configuration parameters.

Syntax

```
ALTER USER user-name {  
  account-parameter value[,...]  
  | SET [PARAMETER] cfg-parameter=value[,...]  
  | CLEAR [PARAMETER] cfg-parameter[,...]  
}
```

Parameters

user-name

Name of the user. Names that contain special characters must be double-quoted. To enforce case-sensitivity, use double-quotes.

For details on name requirements, see [Creating a database name and password](#).

account-parameter value

Specifies user account settings (see below).

Note

Changes to a user account apply only to the current session and to all later sessions launched by this user.

SET [PARAMETER]

Sets the specified configuration parameters. The new setting applies only to the current session, and to all later sessions launched by this user. Concurrent user sessions are unaffected by new settings unless they call meta-function [RESET_SESSION](#).

CLEAR [PARAMETER]

Resets the specified configuration parameters to their default values.

Important

SET | CLEAR PARAMETER can specify only user-level configuration parameters, otherwise Vertica returns an error. For details, see [Setting User-Level Configuration Parameters](#) below.

User account parameters

Specify one or more user-account parameters and their settings as a comma-delimited list:

```
account-parameter value[,...]
```

Important

The following user-account parameters are invalid for a user who is added to the Vertica database with the LDAPLink service:

- IDENTIFIED BY
- PROFILE
- SECURITY ALGORITHM

Parameter	Setting
ACCOUNT	<p>Locks or unlocks user access to the database, one of the following:</p> <ul style="list-style-type: none">• UNLOCK (default)• LOCK prevents a new user from logging in. This can be useful when creating an account for a user who does not need immediate access. <p>Tip To automate account locking, set a maximum number of failed login attempts with CREATE PROFILE.</p>
DEFAULT ROLE	<p>Specifies what roles are the default roles for this user, set to one of the following:</p> <ul style="list-style-type: none">• NONE (default): Removes all default roles.• role [...]: Comma-delimited list of roles.• ALL : Sets as default all user roles.• ALL EXCEPT role [...]: Comma-delimited list of roles to exclude as default roles. <p>Default roles are automatically activated when a user logs in. The roles specified by this parameter supersede any roles assigned earlier.</p> <p>Note DEFAULT ROLE cannot be specified in combination with other ALTER USER parameters.</p>
GRACEPERIOD	<p>Specifies how long a user query can block on any session socket, one of the following:</p> <ul style="list-style-type: none">• NONE (default): Removes any grace period previously set on session queries.• 'interval' : Specifies as an interval the maximum grace period for current session queries, up to 20 days. <p>For details, see Handling session socket blocking.</p>
IDENTIFIED BY	<p>Changes the user's password:</p> <pre>IDENTIFIED BY '[new-password]' ['hashed-password' SALT 'hash-salt'] [REPLACE 'current-password']</pre> <ul style="list-style-type: none">• new-password : ASCII password that Vertica then hashes for internal storage. An empty string enables this user to access the database with no password.• hashed-password : A pre-hashed password and its associated hex string hash-salt . Setting a password this way bypasses all password complexity requirements.• REPLACE: Required for non-superusers, who must supply their current password. Non-superusers can only change their own passwords. <p>For details, see Password guidelines and Creating a database name and password.</p>

<p>IDLESESSIONTIMEOUT</p>	<p>The length of time the system waits before disconnecting an idle session, one of the following:</p> <ul style="list-style-type: none"> • NONE (default): No limit set for this user. If you omit this parameter, no limit is set for this user. • '<i>interval</i>': An interval value, up to one year. <p>For details, see Managing client connections.</p>
<p>MAXCONNECTIONS</p>	<p>Sets the maximum number of connections the user can have to the server, one of the following:</p> <ul style="list-style-type: none"> • NONE (default): No limit set. If you omit this parameter, the user can have an unlimited number of connections across the database cluster. • integer ON DATABASE : Sets to <i>integer</i> the maximum number of connections across the database cluster. • integer ON NODE : Sets to <i>integer</i> the maximum number of connections to each node. <p>For details, see Managing client connections.</p>
<p>MEMORYCAP</p>	<p>Sets how much memory can be allocated to user requests, one of the following:</p> <ul style="list-style-type: none"> • NONE (default): No limit • A string value that specifies the memory limit, one of the following: <ul style="list-style-type: none"> ◦ '<i>int</i>%' expresses the maximum as a percentage of total memory available to the Resource Manager, where <i>int</i> is an integer value between 0 and 100. For example: MEMORYCAP '40%' ◦ '<i>int</i>{K M G T}' expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example: MEMORYCAP '10G'
<p>PASSWORD EXPIRE</p>	<p>Forces immediate expiration of the user's password. The user must change the password on the next login.</p> <div data-bbox="451 1060 1559 1239" style="background-color: #e6f2ff; padding: 10px;"> <p>Note PASSWORD EXPIRE has no effect when using external password authentication methods such as LDAP or Kerberos.</p> </div>
<p>PROFILE</p>	<p>Assigns a profile that controls password requirements for this user, one of the following:</p> <ul style="list-style-type: none"> • DEFAULT (default): Assigns the default database profile to this user. • profile-name : A profile that is defined by CREATE PROFILE.
<p>RENAME TO</p>	<p>Assigns the user a new user name. All privileges assigned to the user remain unchanged.</p> <div data-bbox="451 1528 1559 1675" style="background-color: #e6f2ff; padding: 10px;"> <p>Note RENAME TO cannot be specified in combination with other ALTER USER parameters.</p> </div>
<p>RESOURCE POOL <i>pool-name</i> [FOR SUBCLUSTER <i>sc-name</i>]</p>	<p>Assigns a resource pool to this user. The user must also be granted privileges to this pool, unless privileges to the pool are set to PUBLIC .</p> <p>The FOR SUBCLUSTER clause assigns a subcluster-specific resource pool to the user. You can assign only one subcluster-specific resource pool to each user.</p>

RUNTIMECAP	<p>Sets how long this user's queries can execute, one of the following:</p> <ul style="list-style-type: none"> • NONE (default): No limit set for this user. If you omit this parameter, no limit is set for this user. • '<i>interval</i>': An interval value, up to one year. <p>A query's runtime limit can be set at three levels: the user's runtime limit, the user's resource pool, and the session setting. For more information, see Setting a runtime limit for queries.</p>
SEARCH_PATH	<p>Specifies the user's default search path, that tells Vertica which schemas to search for unqualified references to tables and UDFs, one of the following:</p> <ul style="list-style-type: none"> • DEFAULT (default): Sets the search path as follows: <pre>"\$user", public, v_catalog, v_monitor, v_internal</pre> • Comma-delimited list of schemas. <p>For details, see Setting Search Paths.</p>
SECURITY_ALGORITHM 'algorithm'	<p>Sets the user-level security algorithm for hash authentication, where <i>algorithm</i> is one of the following:</p> <ul style="list-style-type: none"> • NONE (default): Uses the system-level parameter, SecurityAlgorithm • SHA512 • MD5 <p>The user's password expires when you change the SECURITY_ALGORITHM value and must be reset.</p>
TEMPSPACECAP	<p>Sets how much temporary file storage is available for user requests, one of the following:</p> <ul style="list-style-type: none"> • NONE (default): No limit • String value that specifies the storage limit, one of the following: <ul style="list-style-type: none"> ◦ <i>int</i>% expresses the maximum as a percentage of total temporary storage available to the Resource Manager, where <i>int</i> is an integer value between 0 and 100. For example: TEMPSPACECAP '40%' ◦ <i>int</i>{K M G T} expresses storage allocation in kilobytes, megabytes, gigabytes, or terabytes. For example: TEMPSPACECAP '10G'

Privileges

Non-superusers can change the following options on their own user accounts:

- **IDENTIFIED BY**
- **RESOURCE POOL**
- **SEARCH_PATH**
- **SECURITY_ALGORITHM**

When changing a another user's resource pool to one outside of the PUBLIC schema, the user must have USAGE privileges on the resource pool from at least one of the following:

- [Object ownership](#)
- [Explicit grant to the user](#)
- [Default role](#)

Setting user-level configuration parameters

SET | CLEAR PARAMETER can specify only user-level configuration parameters, otherwise Vertica returns an error. Only superusers can set and clear user-level parameters, unless they are also supported at the session level.

To get the names of user-level parameters, query system table [CONFIGURATION_PARAMETERS](#). For example:

```
=> SELECT parameter_name, allowed_levels FROM configuration_parameters
WHERE allowed_levels ilike '%USER%' AND parameter_name ilike '%depot%' ORDER BY parameter_name;
parameter_name | allowed_levels
-----+-----
BackgroundDepotWarming | SESSION, USER, DATABASE
DepotOperationsForQuery | SESSION, USER, DATABASE
EnableDepotWarmingFromPeers | SESSION, USER, DATABASE
UseDepotForReads | SESSION, USER, DATABASE
UseDepotForWrites | SESSION, USER, DATABASE
(5 rows)
```

The following example sets the user-level configuration parameter UseDepotForWrites for two users, Yvonne and Ahmed:

```
=> SHOW USER Yvonne PARAMETER ALL;
user | parameter | setting
-----+-----
Yvonne | DepotOperationsForQuery | Fetches
(1 row)

=> ALTER USER Yvonne SET PARAMETER UseDepotForWrites = 0;
ALTER USER
=> SHOW USER Yvonne PARAMETER ALL;
user | parameter | setting
-----+-----
Yvonne | DepotOperationsForQuery | Fetches
Yvonne | UseDepotForWrites | 0
(2 rows)

=> ALTER USER Ahmed SET PARAMETER DepotOperationsForQuery = 'Fetches';
ALTER USER
=> SHOW USER ALL PARAMETER ALL;
user | parameter | setting
-----+-----
Ahmed | DepotOperationsForQuery | Fetches
Yvonne | DepotOperationsForQuery | Fetches
Yvonne | UseDepotForWrites | 0
(3 rows)
```

Examples

Set a user's password

```
=> CREATE USER user1;
=> ALTER USER user1 IDENTIFIED BY 'newpassword';
```

Set user's security algorithm and password

This example sets a user's security algorithm and password to **SHA-512** and **newpassword**, respectively. When you execute the **ALTER USER** statement, Vertica hashes the password with the SHA-512 algorithm and saves the hash:

```
=> CREATE USER user1;
=> ALTER USER user1 SECURITY_ALGORITHM 'SHA512' IDENTIFIED BY 'newpassword'
```

Assign default roles to a user

This example make a user's assigned roles their [default roles](#). Default roles are automatically set (enabled) when a user logs in:

```
=> CREATE USER user1;
CREATE USER
=> GRANT role1, role2, role3 to user1;
=> ALTER USER user1 DEFAULT ROLE ALL;
```

You can pair ALL with EXCEPT to exclude certain roles:

```
=> CREATE USER user2;
CREATE USER
=> GRANT role1, role2, role3 to user2;
=> ALTER USER user2 DEFAULT ROLE ALL EXCEPT role1;
```

See also

- [CREATE USER](#)
- [DROP USER](#)
- [SHOW USER](#)

ALTER VIEW

Modifies the metadata of an existing [view](#). The changes are auto-committed.

Syntax

General usage:

```
ALTER VIEW [[database.]schema.]view {
  | OWNER TO owner
  | SET SCHEMA schema
  | { INCLUDE | EXCLUDE | MATERIALIZE } [ SCHEMA ] PRIVILEGES
}
```

Rename view:

```
ALTER VIEW [[database.]schema.]view[,...] RENAME TO new-view-name[,...]
```

Parameters

[**database .**] **schema**

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

view

The view to alter.

SET SCHEMA *schema* ``

Moves the view from one schema to another.

OWNER TO *owner*

Changes the view owner.

Important

The new view owner should also have SELECT privileges on the objects that the view references; otherwise the view is inaccessible to that user.

{ INCLUDE | EXCLUDE | MATERIALIZE } [SCHEMA] PRIVILEGES

Specifies default inheritance of schema privileges for this view:

- **EXCLUDE [SCHEMA] PRIVILEGES** (default) disables inheritance of privileges from the schema.
- **INCLUDE [SCHEMA] PRIVILEGES** grants the view the same privileges granted to its schema.
- **MATERIALIZE** : Copies grants to the view and creates a GRANT object on the view. This disables the inherited privileges flag on the view, so

you can:

- Grant more specific privileges at the view level
- Use schema-level privileges as a template
- Move the view to a different schema
- Change schema privileges without affecting the view

Note

If [inherited privileges are disabled at the database level](#), schema privileges can still be materialized.

See also [Setting privilege inheritance on tables and views](#).

RENAME TO

Renames one or more views:

```
RENAME TO new-view-name[,...]
```

The following requirements apply:

- The new view name conforms to conventions described in [Identifiers](#). It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.
- If you specify multiple views to rename, the source and target lists must have the same number of names.
- Renaming a view requires **USAGE** and **CREATE** privileges on the schema that contains the view.

Privileges

Non-superuser: USAGE on the schema and one of the following:

- View owner
- ALTER privilege on the view

For certain operations, non-superusers must have the following schema privileges:

Schema privileges required...	For these operations...
CREATE, USAGE	Rename view
CREATE: destination schema USAGE: current schema	Move view to another schema

Examples

Rename view **view1** to **view2** :

```
=> CREATE VIEW view1 AS SELECT * FROM t;  
CREATE VIEW  
=> ALTER VIEW view1 RENAME TO view2;  
ALTER VIEW
```

BEGIN

Starts a transaction block.

Note

BEGIN is a synonym for [START TRANSACTION](#).

Syntax

```
BEGIN [ WORK | TRANSACTION ] [ isolation-level ] [ READ [ONLY] | WRITE ]
```

Parameters

WORK | TRANSACTION

Optional keywords for readability only.

isolation-level

Specifies the transaction's isolation level, which determines what data the transaction can access when other transactions are running concurrently, one of the following:

- [READ COMMITTED](#) (default)
- [SERIALIZABLE](#)
- REPEATABLE READ (automatically converted to SERIALIZABLE)
- READ UNCOMMITTED (automatically converted to READ COMMITTED)

For details, see [Transactions](#).

READ [ONLY] | WRITE

Specifies the transaction mode, one of the following:

- READ WRITE (default): Transaction is read/write.
- READ ONLY: Transaction is read-only.

Setting the transaction session mode to read-only disallows the following SQL statements, but does not prevent all disk write operations:

- INSERT, UPDATE, DELETE, and COPY if the target table is not a temporary table
- All CREATE, ALTER, and DROP commands

- GRANT, REVOKE, and EXPLAIN if the SQL to run is one of the statements cited above.

Privileges

None

Examples

Create a transaction with the isolation level set to READ COMMITTED and the transaction mode to READ WRITE:

```
=> BEGIN TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
BEGIN
=> CREATE TABLE sample_table (a INT);
CREATE TABLE
=> INSERT INTO sample_table (a) VALUES (1);
OUTPUT
-----
1
(1 row)
=> END;
COMMIT
```

See also

- [Transactions](#)
- [Creating and rolling back transactions](#)
- [COMMIT](#)
- [END](#)
- [ROLLBACK](#)

CALL

Invokes a [stored procedure](#) created with [CREATE PROCEDURE \(stored\)](#).

Syntax

```
CALL [[database.]schema.]procedure( [ argument-list ] );
```

Parameters

[***database.***] ***schema***

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

procedure

The name of the stored procedure, where [procedure](#) conforms to conventions described in [Identifiers](#).

argument-list

A comma-delimited list of arguments to pass to the stored procedure, whose types correspond to the types of the argument's [IN parameters](#).

Privileges

Non-superuser: EXECUTE on the procedure

Examples

See [Executing stored procedures](#) and [Stored procedures: use cases and examples](#).

See also

- [DO](#)
- [CREATE PROCEDURE \(stored\)](#)
- [DROP PROCEDURE \(stored\)](#)

COMMENT ON statements

COMMENT ON statements let you create comments on database objects, such as schemas, tables, and libraries. Each object can have one comment.

Comments are stored in the system table [COMMENTS](#).

In this section

- [COMMENT ON AGGREGATE FUNCTION](#)

- [COMMENT ON ANALYTIC FUNCTION](#)
- [COMMENT ON COLUMN](#)
- [COMMENT ON CONSTRAINT](#)
- [COMMENT ON FUNCTION](#)
- [COMMENT ON LIBRARY](#)
- [COMMENT ON NODE](#)
- [COMMENT ON PROJECTION](#)
- [COMMENT ON SCHEMA](#)
- [COMMENT ON SEQUENCE](#)
- [COMMENT ON TABLE](#)
- [COMMENT ON TRANSFORM FUNCTION](#)
- [COMMENT ON VIEW](#)

COMMENT ON AGGREGATE FUNCTION

Adds, revises, or removes a comment on an aggregate function. Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Syntax

```
COMMENT ON AGGREGATE FUNCTION [[database.]schema.]function (function-args) IS { 'comment' | NULL };
```

Parameters

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

function

The name of the aggregate function with which to associate the comment.

function-args

The function arguments.

comment

Specifies the comment text to add. If a comment already exists for this function, this overwrites the previous one.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the [APPROXIMATE_MEDIAN\(x FLOAT\)](#) function:

```
=> COMMENT ON AGGREGATE FUNCTION APPROXIMATE_MEDIAN(x FLOAT) IS 'alias of APPROXIMATE_PERCENTILE with 0.5 as its parameter';
```

The following example removes a comment from the [APPROXIMATE_MEDIAN\(x FLOAT\)](#) function:

```
=> COMMENT ON AGGREGATE FUNCTION APPROXIMATE_MEDIAN(x FLOAT) IS NULL;
```

COMMENT ON ANALYTIC FUNCTION

Adds, revises, or removes a comment on an analytic function. Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Syntax

```
COMMENT ON ANALYTIC FUNCTION [[database.]schema.]function (function-args) IS { 'comment' | NULL };
```

Parameters

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

function

The name of the analytic function with which to associate the comment.

function-args

The function arguments.

comment

Specifies the comment text to add. If a comment already exists for this function, this overwrites the previous one.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the user-defined `an_rank()` function:

```
=> COMMENT ON ANALYTIC FUNCTION an_rank() IS 'built from the AnalyticFunctions library';
```

The following example removes a comment from the user-defined `an_rank()` function:

```
=> COMMENT ON ANALYTIC FUNCTION an_rank() IS NULL;
```

COMMENT ON COLUMN

Adds, revises, or removes a comment on a column in a table or projection. Each object can have one comment. Comments are stored in the [COMMENTS](#) system table.

Syntax

```
COMMENT ON COLUMN [[database.]schema.]object.column IS {'comment' | NULL}
```

Arguments

[**database .**] **schema**

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

object

Name of the table or projection containing the column.

column

Name of the column to which the comment applies.

comment | **NULL**

Comment text to add, or NULL to remove an existing comment. The new value replaces any existing comment for this column.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment for a table column:

```
=> COMMENT ON COLUMN store.store_sales_fact.transaction_time IS 'GMT';
```

You can also add comments to columns in projections:

```
=> COMMENT ON COLUMN customer_dimension_vmart_node01.customer_name IS 'Last name only';
```

To remove a comment, specify NULL:

```
=> COMMENT ON COLUMN store.store_sales_fact.transaction_time IS NULL;
```

COMMENT ON CONSTRAINT

Adds, revises, or removes a comment on a constraint. Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Syntax

```
COMMENT ON CONSTRAINT constraint ON [[database.]schema.]table IS ... { 'comment' | NULL };
```

Parameters

constraint

The name of the constraint associated with the comment.

[*database.*] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

table

The name of the table constraint with which to associate a comment.

comment

Specifies the comment text to add. If a comment already exists for this constraint, this comment overwrites the previous one.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the `constraint_x` constraint on the `promotion_dimension` table:

```
=> COMMENT ON CONSTRAINT constraint_x ON promotion_dimension IS 'Primary key';
```

The following example removes a comment from the `constraint_x` constraint on the `promotion_dimension` table:

```
=> COMMENT ON CONSTRAINT constraint_x ON promotion_dimension IS NULL;
```

COMMENT ON FUNCTION

Adds, revises, or removes a comment on a function. Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Syntax

```
COMMENT ON FUNCTION [[database.]schema.]function (function-args) IS { 'comment' | NULL };
```

Parameters

[*database.*] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function

The name of the function with which to associate the comment.

function-args

The function arguments.

comment

Specifies the comment text to add. If a comment already exists for this function, this overwrites the previous one.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the `macros.zerowhennull (x INT)` function:

```
=> COMMENT ON FUNCTION macros.zerowhennull(x INT) IS 'Returns a 0 if not NULL';
```

The following example removes a comment from the `macros.zerowhennull (x INT)` function:

```
=> COMMENT ON FUNCTION macros.zerowhennull(x INT) IS NULL;
```

COMMENT ON LIBRARY

Adds, revises, or removes a comment on a library . Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Syntax

```
COMMENT ON LIBRARY [[database.]schema.]library IS {'comment' | NULL}
```

Parameters

[*database* .] *schema*

Database and [schema](#) . The default schema is [public](#) . If you specify a database, it must be the current database.

library

The name of the library associated with the comment.

comment

Specifies the comment text to add. If a comment already exists for this library, this comment overwrites the previous one.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the library [MyFunctions](#):

```
=> COMMENT ON LIBRARY MyFunctions IS 'In development';
```

The following example removes a comment from the library [MyFunctions](#):

```
=> COMMENT ON LIBRARY MyFunctions IS NULL;
```

See also

- [COMMENTS](#)

COMMENT ON NODE

Adds, revises, or removes a comment on a node. Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Dropping an object drops all comments associated with the object.

Syntax

```
COMMENT ON NODE node-name IS { 'comment' | NULL }
```

Parameters

node-name

The name of the node associated with the comment.

comment

Specifies the comment text to add. If a comment already exists for this node, this comment overwrites the previous one.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment for the [initiator node](#) :

```
=> COMMENT ON NODE initiator IS 'Initiator node';
```

The following example removes a comment from the `initiator node` :

```
=> COMMENT ON NODE initiator IS NULL;
```

See also

[COMMENTS](#)

COMMENT ON PROJECTION

Adds, revises, or removes a comment on a projection. Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Dropping an object drops all comments associated with the object.

Syntax

```
COMMENT ON PROJECTION [[database.]schema.]projection IS { 'comment' | NULL }
```

Parameters

[*database* .] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

projection

The name of the projection associated with the comment.

comment

Specifies the text of the comment to add. If a comment already exists for this projection, the comment you enter here overwrites the previous comment.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the `customer_dimension_vmart_node01` projection:

```
=> COMMENT ON PROJECTION customer_dimension_vmart_node01 IS 'Test data';
```

The following example removes a comment from the `customer_dimension_vmart_node01` projection:

```
=> COMMENT ON PROJECTION customer_dimension_vmart_node01 IS NULL;
```

See also

[COMMENTS](#)

COMMENT ON SCHEMA

Adds, revises, or removes a comment on a schema. Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Syntax

```
COMMENT ON SCHEMA schema-name IS { 'comment' | NULL }
```

Parameters

schema-name

The schema associated with the comment.

comment

Text of the comment to add. If a comment already exists for this schema, the comment you enter here overwrites the previous comment.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the `public` schema:

```
=> COMMENT ON SCHEMA public IS 'All users can access this schema';
```

The following example removes a comment from the `public` schema.

```
=> COMMENT ON SCHEMA public IS NULL;
```

COMMENT ON SEQUENCE

Adds, revises, or removes a comment on a sequence. Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Syntax

```
COMMENT ON SEQUENCE [[database.]schema.]sequence IS { 'comment' | NULL }
```

Parameters

[*database* .] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

sequence

The name of the sequence associated with the comment.

comment

Specifies the text of the comment to add. If a comment already exists for this sequence, this comment overwrites the previous one.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the sequence called `prom_seq`.

```
=> COMMENT ON SEQUENCE prom_seq IS 'Promotion codes';
```

The following example removes a comment from the `prom_seq` sequence.

```
=> COMMENT ON SEQUENCE prom_seq IS NULL;
```

COMMENT ON TABLE

Adds, revises, or removes a comment on a table. Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Syntax

```
COMMENT ON TABLE [[database.]schema.]table IS { 'comment' | NULL }
```

Parameters

[*database* .] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

table

The name of the table with which to associate the comment.

comment

Specifies the text of the comment to add. Enclose the text of the comment within single-quotes. If a comment already exists for this table, the comment you enter here overwrites the previous comment.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes a previously added comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the `promotion_dimension` table:

```
=> COMMENT ON TABLE promotion_dimension IS '2011 Promotions';
```

The following example removes a comment from the `promotion_dimension` table:

```
=> COMMENT ON TABLE promotion_dimension IS NULL;
```

COMMENT ON TRANSFORM FUNCTION

Adds, revises, or removes a comment on a user-defined transform function. Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Syntax

```
COMMENT ON TRANSFORM FUNCTION [[database.]schema.]tfunction  
...( [ tfunction-arg-name tfunction-arg-type ][,...] ) IS { 'comment' | NULL }
```

Parameters

[***database*** .] ***schema***

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

tfunction

The name of the transform function with which to associate the comment.

tfunction-arg-name* *tfunction-arg-type

The names and data types of one or more transform function arguments. If you supply argument names and types, each type must match the type specified in the library used to create the original transform function.

comment

Specifies the comment text to add. If a comment already exists for this transform function, this comment overwrites the previous one.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment to the `macros.zerowhennull (x INT)` UTF function:

```
=> COMMENT ON TRANSFORM FUNCTION macros.zerowhennull(x INT) IS 'Returns a 0 if not NULL';
```

The following example removes a comment from the `macros.zerowhennull (x INT)` function by using the `NULL` option:

```
=> COMMENT ON TRANSFORM FUNCTION macros.zerowhennull(x INT) IS NULL;
```

COMMENT ON VIEW

Adds, revises, or removes a comment on a view. Each object can have one comment. Comments are stored in the system table [COMMENTS](#).

Syntax

```
COMMENT ON VIEW [[database.]schema.]view IS { 'comment' | NULL }
```

Parameters

[***database*** .] ***schema***

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

view

The name of the view with which to associate the comment.

comment

Specifies the text of the comment to add. If a comment already exists for this view, this comment overwrites the previous one.

Comments can be up to 8192 characters in length. If a comment exceeds that limitation, Vertica truncates the comment and emits a message.

NULL

Removes an existing comment.

Privileges

Non-superuser: object owner

Examples

The following example adds a comment from the `curr_month_ship` view:

```
=> COMMENT ON VIEW curr_month_ship IS 'Shipping data for the current month';
```

The following example removes a comment from the `curr_month_ship` view:

```
=> COMMENT ON VIEW curr_month_ship IS NULL;
```

COMMIT

Ends the current transaction and makes all changes that occurred during the transaction permanent and visible to other users.

COMMIT is a synonym for [END](#)

Syntax

```
COMMIT [ WORK | TRANSACTION ]
```

Parameters

WORK TRANSACTION

Optional keywords for readability only.

Privileges

None

Examples

This example shows how to commit an insert.

```
=> CREATE TABLE sample_table (a INT);
=> INSERT INTO sample_table (a) VALUES (1);
```

OUTPUT

```
-----
```

```
1
```

```
=> COMMIT;
```

See also

- [Transactions](#)
- [Creating and rolling back transactions](#)
- [BEGIN](#)
- [ROLLBACK](#)
- [START TRANSACTION](#)

CONNECT TO VERTICA

Connects to another Vertica database to enable importing and exporting data across Vertica databases, with [COPY FROM VERTICA](#) and [EXPORT TO VERTICA](#), respectively.

After you establish a connection to another database, the connection remains open in the current session until you explicitly close it with [DISCONNECT](#). You can have only one connection to another database at a time. However, you can establish successive connections to different databases in the same session.

By default, invoking **CONNECT TO VERTICA** occurs over the Vertica private network. For information about creating a connection over a public network, see [Using public and private IP networks](#).

Important

Copy and export operations can fail if either side of the connection is a single-node cluster installed on `localhost`.

Syntax

```
CONNECT TO VERTICA db-spec
  [ USER username ]
  [ PASSWORD 'password' ] ON 'host', port
  [ TLS CONFIGURATION tls_configuration ]
  [ TLSMODE PREFER ]
```

Parameters

db-spec

The target database, either the database name or `DEFAULT`.

username

The username to use when connecting to the other database. If omitted, the current user's username is used.

password

The password of the user on the target database. If omitted, you can use credential forwarding or mutual TLS to authenticate to the target database. For details, see [Passwordless authentication](#)

host

The host name of one of the nodes in the other database.

port

The port number of the other database.

tls_configuration

The [TLS Configuration](#) to use for TLS. The TLS Configuration is ignored if `ImportExportTLSMode` is set to any of the following:

- `REQUIRE_FORCE`
- `VERIFY_CA_FORCE`
- `VERIFY_FULL_FORCE`

The effective TLS mode of `CONNECT TO VERTICA` changes depending on the `TLSMODE` of the TLS Configuration and the value of [ImportExportTLSMode](#) (for non-FORCE values). For details, see [Effective TLSMode](#).

If the target database is configured for [mutual TLS](#) and the user on the target database can [authenticate with TLS](#), you can use `tls_configuration` to authenticate instead of `password`.

TLSMODE PREFER

Deprecated

This parameter has been superseded by the `TLS CONFIGURATION` parameter. `TLSMODE PREFER` only takes effect if `TLS CONFIGURATION` is not set.

Overrides the value of configuration parameter [ImportExportTLSMode](#) for this connection to `PREFER`. If `TLS CONFIGURATION` is set or `ImportExportTLSMode` is set to `REQUIRE_FORCE`, `VERIFY_CA_FORCE`, or `VERIFY_FULL_FORCE`, then `TLSMODE PREFER` has no effect.

If `TLSMODE PREFER` and `ImportExportTLSMode` are both not set, `CONNECT TO VERTICA` uses `ENABLE`.

Effective TLS mode

The effective TLS mode of `CONNECT TO VERTICA` is determined by the `TLSMODE` of the TLS Configuration and the value of `ImportExportTLSMode`. The following table summarizes this interaction for non-FORCE values of `ImportExportTLSMode`:

TLS Configuration	ImportExportTLSMode	Effective TLS mode
ENABLE	PREFER	PREFER
ENABLE	Anything except PREFER	REQUIRE
TRY_VERIFY, VERIFY_CA	Anything	VERIFY_CA
VERIFY_FULL	Anything	VERIFY_FULL

Privileges

None

Security requirements

When importing from or exporting to a Vertica database, you can connect only to a database that uses trusted (username only) or password-based authentication, as described in [Security and authentication](#). OAuth and Kerberos authentication methods are not supported.

If configured with a certificate, Vertica encrypts data during transmission using TLS and attempts to encrypt plan metadata. You can set configuration parameter [ImportExportTLSMode](#) to require encryption for plan metadata.

Passwordless authentication

If you omit the *password* in the call to CONNECT TO VERTICA, you can authenticate to the target database in the following ways:

- Credential forwarding
- TLS authentication

For brevity, in this and later sections, "caller" refers to the user that runs CONNECT TO VERTICA from the source database to connect to the target database.

Credential forwarding

Credential forwarding lets you authenticate as the current user on the target database by forwarding your hash or password, depending on the caller's authentication method on the target database. To do this, the following requirements must be met:

- The caller exists in both databases.
- In the target database, the caller has been [granted a hash or ldap authentication record](#).

For an example, see [Examples](#).

TLS authentication

TLS authentication lets you use the certificates and keys in the specified [tls_configuration](#) parameter to authenticate instead of a password. To do this, the following requirements must be met:

- The caller exists in both databases.
- In the source database:
 - A custom [TLS configurations](#) contains a CA certificate, a client certificate, and client key that can be used to authenticate to the target database with TLS authentication.
 - The caller has [USAGE privileges](#) on the TLS Configuration.
- In the target database:
 - The caller has been [granted a TLS authentication record](#).
 - The caller can [authenticate with TLS](#) using the certificates of TLS Configuration from the source database. This requires a CA certificate that signs the client certificate from the source database.

For an example, see [Examples](#).

Examples

Password authentication

The following example authenticates as the dbadmin to [ExampleDB](#) on the host [VerticaHost01](#) on port [5433](#) :

```
=> CONNECT TO VERTICA ExampleDB USER dbadmin PASSWORD 'Password123' ON 'VerticaHost01',5433;  
CONNECT
```

Credential forwarding

In the following example, Penny wants to run CONNECT TO VERTICA from [db_1](#) to connect to [db_2](#) :

Note

In general, the [LDAP link service](#) should be used instead to synchronize users between databases. For demonstration purposes, the example below manually configures the user [penny](#) on both databases. You can skip these steps if you use LDAP Link.

1. On [db_1](#) , create the user [penny](#) :

```
=> CREATE USER penny IDENTIFIED BY 'my_password';
```

2. On [db_2](#) , create the user [penny](#) with the same hash, salt, and [security \(hashing\) algorithm](#) :

1. On `db_1` , retrieve the hash (from the `password` column) and salt from `PASSWORDS` :

```
=> SELECT user_name, password, salt FROM passwords WHERE user_name='penny';
[ RECORD 1 ]-----
user_name | penny
password  | sha512b2e0911954a79d9d419b7b42774d36d17dd8a663c966bf0dd8f4cd6aad00d3c7ee7ba74b9bf0e56071cd995ae04aeaae537b35903e97255ed5f92255ed5f92255ed5f92255ed5f
salt      | eac4ad840264e8c590120b31b815318f
```

2. On `db_1` , retrieve the effective security algorithm from `PASSWORD_AUDITOR` :

```
=> SELECT user_name, effective_security_algorithm FROM password_auditor WHERE user_name='penny';
user_name | effective_security_algorithm
-----
penny     | SHA512
(1 row)
```

3. On `db_2` , create the user `penny` :

```
=> CREATE USER penny;
```

4. On `db_2` , use `ALTER USER` to set the security algorithm to the value in `db_1` . For details, see [Password hashing algorithm](#) :

```
=> ALTER USER penny SECURITY_ALGORITHM 'SHA512';
```

5. On `db_2` , set `penny` 's password using the hash and salt from `db_1` :

```
=> ALTER USER penny IDENTIFIED BY
sha512b2e0911954a79d9d419b7b42774d36d17dd8a663c966bf0dd8f4cd6aad00d3c7ee7ba74b9bf0e56071cd995ae04aeaae537b35903e97255ed5f92255ed5f92255ed5f92255ed5f
SALT 'eac4ad840264e8c590120b31b815318f';
```

3. On `db_1` , enable credential forwarding for `penny` by setting `EnableConnectCredentialForwarding` (disabled by default):

```
=> ALTER USER penny SET EnableConnectCredentialForwarding=1;
```

4. On `db_2` , [create](#) an authentication record with the `hash` method:

Note

This example authentication record lets its grantees authenticate to Vertica without TLS. In general, you should also [configure client-server TLS](#) and then specify `HOST TLS` so the hashed password is forwarded to the target database over a secure connection. For example:

```
=> CREATE AUTHENTICATION v_hash_auth METHOD 'hash' HOST TLS '0.0.0.0/0';
```

```
=> CREATE AUTHENTICATION v_hash_auth METHOD 'hash' HOST '0.0.0.0/0';
```

5. Grant the authentication record to `penny` :

```
=> GRANT AUTHENTICATION v_hash_auth TO penny;
```

6. On `db_1` , run `CONNECT TO VERTICA` to connect to `db_2` , omitting the password. This example uses the [default port](#) :

```
=> CONNECT TO VERTICA db_2 ON 'example.com', 5433;
```

TLS authentication

In the following example, Penny wants to run `CONNECT TO VERTICA` from `db_1` to connect to `db_2` without specifying her password:

1. Create the user `penny` on both databases.

```
=> CREATE USER penny IDENTIFIED BY 'my_password';
```

2. On `db_1` , [create or import](#) a CA certificate, server certificate, and client certificate.

```

-- Create a CA certificate
=> CREATE KEY root_key TYPE 'RSA' LENGTH 2048;

=> CREATE CA CERTIFICATE mtls_root_cert
SUBJECT '/C=US/ST=Massachusetts/L=Burlington/O=OpenText/OU=Vertica/CN=Vertica Root CA'
VALID FOR 3650
EXTENSIONS 'authorityKeyIdentifier' = 'keyid:always,issuer', 'nsComment' = 'Vertica generated root CA cert'
KEY mtls_root_key;

-- Create a client certificate, signing it with the CA certificate
=> CREATE KEY client_key TYPE 'RSA' LENGTH 2048;

=> CREATE CERTIFICATE mtls_client_cert
SUBJECT '/C=US/ST=Massachusetts/L=Burlington/O=OpenText/OU=Vertica/CN=penny'
SIGNED BY mtls_root_cert
EXTENSIONS 'nsComment' = 'Vertica client cert', 'extendedKeyUsage' = 'clientAuth'
KEY mtls_client_key;

-- Create a server certificate, signing it with the CA certificate
CREATE KEY mtls_server_key TYPE 'RSA' LENGTH 2048;

CREATE CERTIFICATE mtls_server_cert
SUBJECT '/C=US/ST=Massachusetts/L=Burlington/O=OpenText/OU=Vertica/CN=*.example.com'
SIGNED BY mtls_root_cert
EXTENSIONS 'extendedKeyUsage' = 'serverAuth'
KEY mtls_server_key;

```

- On `db_1`, create a custom TLS configuration to use with CONNECT TO VERTICA, adding the `mtls_client_cert` and `mtls_root_cert` as the certificates and setting `TLSMODE` to `ENABLE` or higher:

```

=> CREATE TLS CONFIGURATION mtls;
=> ALTER TLS CONFIGURATION mtls CERTIFICATE mtls_client_cert ADD CA CERTIFICATES mtls_root_cert TLSMODE 'ENABLE';

```

- On `db_2`, import the CA certificate, server certificate, and server key from `db_1`. You can retrieve the contents of a certificate and key from the `CERTIFICATES` and `CRYPTOGRAPHIC_KEYS` system tables:

```

=> CREATE CA CERTIFICATE mtls_root_cert AS '-----BEGIN CERTIFICATE-----certificate_text-----END CERTIFICATE-----';
=> CREATE CERTIFICATE mtls_server_key AS '-----BEGIN PRIVATE KEY-----key-----END PRIVATE KEY-----';
=> CREATE CERTIFICATE mtls_server_cert AS '-----BEGIN CERTIFICATE-----certificate_text-----END CERTIFICATE-----';

```

- On `db_2`, configure [mutual mode client-server TLS](#) using `mtls_root_cert` and `mtls_server_cert` and setting the `TLSMODE` to `TRY_VERIFY` or higher:

```

=> ALTER TLS CONFIGURATION server CERTIFICATE mtls_server_cert ADD CA CERTIFICATES mtls_root_cert TLSMODE 'TRY_VERIFY';

```

- On `db_2`, [create](#) an authentication record for [TLS authentication](#).

```

=> CREATE AUTHENTICATION mtls_auth METHOD 'tls' HOST 'TLS' '0.0.0.0/0';

```

- On `db_2`, [grant](#) `mtls_auth` to `penny`:

```

=> GRANT AUTHENTICATION mtls_auth TO penny;

```

- On `db_1`, run `CONNECT TO VERTICA` to connect to `db_2`, specifying the `mtls` TLS Configuration. This example uses the [default port](#):

```

=> CONNECT TO VERTICA vmart USER penny ON 'example.com', 5433 TLS CONFIGURATION mtls;

```

COPY

`COPY` bulk-loads data into a Vertica database. By default, `COPY` automatically commits itself and any current transaction except when loading temporary tables. If `COPY` is terminated or interrupted, Vertica rolls it back.

`COPY` reads data as UTF-8 encoding.

For information on loading one or more files or pipes on a cluster host or on a client system, see [COPY LOCAL](#).

To define a data pipeline to automatically load new files, see [Automatic load](#).

Syntax

```
COPY [ /*+ LABEL (label-string)* / ] [ [ namespace. | database. ] schema. ] target-table
  [ ( { column-as-expression | column
    [ DELIMITER [ AS ] 'char' ]
    [ ENCLOSED [ BY ] 'char' ]
    [ ENFORCELENGTH ]
    [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
    [ FILLER datatype ]
    [ FORMAT 'format' ]
    [ NULL [ AS ] 'string' ]
    [ TRIM 'byte' ]
    [...] ) ]
  [ COLUMN OPTION (column
    [ DELIMITER [ AS ] 'char' ]
    [ ENCLOSED [ BY ] 'char' ]
    [ ENFORCELENGTH ]
    [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
    [ FORMAT 'format' ]
    [ NULL [ AS ] 'string' ]
    [ TRIM 'byte' ]
    [...] ) ]
FROM {
  [ LOCAL ] STDIN [ compression ]
  | { 'path-to-data'
    [ ON { nodename | (nodeset) | ANY NODE | EACH NODE } ] [ compression ] } [... ]
  [ PARTITION COLUMNS column[...] ]
  | LOCAL 'path-to-data' [ compression ] [... ]
  | VERTICA { source-namespace. | source-database. } [ source-schema. ] source-table [ ( source-column[...] ) ]
}
[ NATIVE
  | FIXEDWIDTH COLSIZES { ( integer ) [... ] }
  | NATIVE VARCHAR
  | ORC
  | PARQUET
]
| [ WITH ] UDL-clause[...]
}
[ ABORT ON ERROR ]
[ DELIMITER [ AS ] 'char' ]
[ ENCLOSED [ BY ] 'char' ]
[ ENFORCELENGTH ]
[ ERROR TOLERANCE ]
[ ESCAPE [ AS ] 'char' | NO ESCAPE ]
[ EXCEPTIONS 'path' [ ON nodename ] [... ] ]
[ NULL [ AS ] 'string' ]
[ RECORD TERMINATOR 'string' ]
[ REJECTED DATA { 'path' [ ON nodename ] [... ] | AS TABLE reject-table } ]
[ REJECTMAX integer ]
[ SKIP integer ]
[ SKIP BYTES integer ]
[ STREAM NAME 'streamName' ]
[ TRAILING NULLCOLS ]
[ TRIM 'byte' ]
[ [ WITH ] PARSER parser [ ( arg=value[...] ) ] ] ]
[ NO COMMIT ]
```

Parameters

See [Parameters](#).

Restrictions

See [Restrictions](#).

Privileges

[Superusers](#) have full COPY privileges. The following requirements apply to non-superusers:

- INSERT privilege on table
- USAGE privilege on schema
- USER-accessible storage location
- Applicable READ or WRITE privileges granted to the storage location where files are read or written

COPY can specify a path to store rejected data and exceptions. If the path resolves to a storage location, the following privileges apply to non-superusers:

- The storage location was created with the USER option (see [CREATE LOCATION](#)).
- The user must have READ access to the storage location, as described in [GRANT \(storage location\)](#)

In this section

- [Parameters](#)
- [Restrictions](#)
- [Parsers](#)
- [Examples](#)

Parameters

COPY parameters and their descriptions are divided into the following sections:

- [Target Options](#)
- [Column Options](#)
- [Input Options](#)
- [Handling Options](#)
- [Parser-Specific Options](#)

Target options

The following options apply to the target tables and their columns:

LABEL

Assigns a label to a statement to identify it for profiling and debugging.

{ *namespace* . | *database* . }

Name of the database or [namespace](#) that contains *table*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be [default_namespace](#).
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#). If you specify the namespace or database name, you must provide the schema name, even if the schema is [public](#).

Note

COPY ignores *schema* when used in CREATE EXTERNAL TABLE or CREATE FLEX EXTERNAL TABLE statements.

target-table

The target columnar or flexible table for loading new data. Vertica loads the data into all projections that include columns from the schema table.

column-as-expression

An expression used to compute values for the target column, which must not be of a complex type. For example:

```
=> COPY t(year AS TO_CHAR(k, 'YYYY')) FROM 'myfile.dat'
```

Use this option to transform data when it is loaded into the target database.

For details, see [Transforming data during loads](#).

column

Restricts the load to one or more specified columns in the table. If you omit specifying columns, COPY loads all columns by default.

Table columns that you omit from the column list are assigned their DEFAULT or SET USING values, if any; otherwise, COPY inserts NULL. If you leave the *column* parameter blank to load all columns in the table, you can use the optional parameter COLUMN OPTION to specify parsing options for specific columns.

The data file must contain the same number of columns as the COPY command's column list.

COLUMN OPTION

Specifies load metadata for one or more columns declared in the table column list. For example, you can specify that a column has its own DELIMITER, ENCLOSED BY, or NULL AS expression, and so on. You do not have to specify every column name explicitly in the COLUMN OPTION list, but each column you specify must correspond to a column in the table column list.

Column options

Depending on how they are specified, the following COPY options can qualify specific columns or all columns. Some parser-specific options can also apply to either specific columns or all columns. See [Global and column-specific options](#). For details about these two modes.

ENFORCELENGTH

If specified, COPY rejects data rows of type CHAR, VARCHAR, BINARY, and VARBINARY, or elements of those types in collections, if they are larger than the declared size.

By default, COPY truncates offending rows of these data types and elements of these types in collections, but does not reject the rows. For more details, see [Handling Messy Data](#).

If a collection does not fit with all of its elements, COPY rejects the row without truncating. It does not reduce the number of elements. This can happen if each element is individually within limits but the number of elements causes the collection to exceed the maximum size for the column.

FILLER *datatype*

Reads but does not copy the data of an input column. Use filler columns to ignore input columns that do not have columns in the table. You can also use filler columns to transform data (see [Examples](#) and [Transforming data during loads](#)). Filler columns cannot be of complex types.

If a filler column has the same name as a column in the table, you must explicitly scope other uses of the name in the COPY statement. To refer to an ambiguous filler column, prefix the name with **"*FILLER*"**.

```
--> COPY names(first FILLER VARCHAR, last,
    full AS "*FILLER*"first)||last) FROM ...;
```

FORMAT ' *format* '

Input format, one of the following:

- octal
- hex
- bitstream

See [Binary \(native\) data](#) to learn more about these formats.

When loading [date/time](#) columns, using FORMAT significantly improves load performance. COPY supports the same formats as the [TO_DATE](#) function. See [Template patterns for date/time formatting](#).

If you specify invalid format strings, the COPY operation returns an error.

NULL [AS]

The string representing a null value. The default is an empty string ("). You can specify a null value as any ASCII value in the range E'\000' to E'\177' inclusive. You cannot use the same character for both the DELIMITER and NULL options. For details, see [Delimited data](#).

Input options

The following options are available for specifying source data:

LOCAL

Loads data files (up to 4,294,967,295 files) on a client system, rather than on a cluster host. LOCAL can qualify the STDIN and [path-to-data](#) arguments. For details, see [COPY LOCAL](#).

Restrictions: Invalid for [CREATE EXTERNAL TABLE AS COPY](#)

STDIN

Reads from the client a standard input instead of a file. STDIN takes one input source only. To load multiple input sources, use [path-to-data](#).

User must have INSERT privileges on the table and USAGE privileges on its schema.

Restrictions: Invalid for [CREATE EXTERNAL TABLE AS COPY](#)

path-to-data

Specifies the absolute path of the file (or files) containing the data, which can be from multiple input sources.

- If the file is stored in HDFS, *path-to-data* is a URI in the [webhdfs](#) scheme, typically `[[s]web]hdfs://[nameservice]/ path` . See [HDFS file system](#) .
- If the file is stored in an S3 bucket, *path-to-data* is a URI in the format `s3:// bucket / path` . See [S3 object store](#) .
- If the file is stored in Google Cloud Storage, *path-to-data* is a URI in the format `gs:// bucket / path` . See [Google Cloud Storage \(GCS\) object store](#) .
- If the file is stored in Azure Blob Storage, *path-to-data* is a URI in the format `azb:// account / container / path` . See [Azure Blob Storage object store](#) .
- If the file is on the local Linux file system or an NFS mount, *path-to-data* is a local absolute file path.

path-to-data can optionally contain wildcards to match more than one file. The file or files must be accessible to the local client or the host on which the COPY statement runs. COPY skips empty files in the file list. A file list that includes directories causes the query to fail. See [Specifying where to load data from](#) . The supported patterns for wildcards are specified in the [Linux Manual Page for Glob \(7\)](#) , and for ADO.net platforms, through the .NET [Directory.GetFiles method](#) .

You can use variables to construct the pathname as described in [Using load scripts](#) .

If *path-to-data* resolves to a storage location on a local file system, and the user invoking COPY is not a superuser, the following requirements apply:

- The storage location was created with [CREATE LOCATION...USAGE USER](#) .
- The user must already have [READ access](#) to the file storage location.

Further, if a user has privileges but is not a superuser, and invokes COPY from that storage location, Vertica ensures that symbolic links do not result in unauthorized access.

PARTITION COLUMNS *column* [...]

Columns whose values are specified in the directory structure and not in the data itself.

- For Hive-style partitioning, paths contain directory names of the form `colname = value` , and COPY parses values for the specified partition columns. If a value is missing or cannot be coerced to the column data type, the source path is rejected.
- For other partition schemes, column expressions specify how to extract values using the [CURRENT_LOAD_SOURCE](#) function. If the expression cannot be evaluated, the source path is rejected.

For more information, see [Partitioned data](#) .

ON *nodename*

Specifies the node on which the data to copy resides and the node that should parse the load file. If you omit *nodename* , the location of the input file defaults to the initiator node. Use *nodename* to copy and parse a load file from a node other than the COPY initiator node.

Note

nodename is invalid with STDIN and LOCAL .

ON (*nodeset*)

Specifies a set of nodes on which to perform the load. The same data must be available for load on all named nodes. *nodeset* is a comma-separated list of node names in parentheses. For example:

```
=> COPY t FROM 'file1.txt' ON (v_vmart_node0001, v_vmart_node0002);
```

Vertica apportions the load among all of the specified nodes. If you also specify ERROR TOLERANCE or REJECTMAX , Vertica instead chooses a single node on which to perform the load.

If the data is available on all nodes, you usually use ON ANY NODE , which is the default for loads from HDFS and cloud object stores. However, you can use ON *nodeset* to do manual load-balancing among concurrent loads.

ON ANY NODE

Specifies that the data to load is available on all nodes, so COPY opens the path and parses it from any node in the cluster. For an Eon Mode database, COPY uses nodes within the same subcluster as the initiator.

Caution

The data must be the same on all nodes. If the data differs on two nodes, an incorrect or incomplete result is returned, with no error or warning.

Vertica attempts to apportion the load among several nodes if a file is large enough to benefit from apportioning. It chooses a single node if ERROR TOLERANCE or REJECTMAX is specified.

You can use a wildcard or glob (such as *.dat) to load multiple input files, combined with the ON ANY NODE clause. If you use a glob, COPY distributes the list of files to all cluster nodes and spreads the workload.

ON ANY NODE is invalid with STDIN and LOCAL . STDIN can only use the client host, and LOCAL indicates a client node.

ON ANY NODE is the default for loads from all paths other than Linux (HDFS and cloud object stores).

ON EACH NODE

Loads data from the specified path on each node. Use this option when the path exists on all nodes but the data files it contains are different on each node. If the path is not valid on all nodes, COPY loads the valid paths and produces a warning. If the path is a shared location, COPY loads it only once as for ON ANY NODE .

compression

The input compression type, one of the following:

- UNCOMPRESSED (default)
- BZIP
- GZIP
- LZO
- ZSTD

Input files can be of any format. If you use wildcards, all qualifying input files must be in the same format. To load different file formats, specify the format types specifically.

The following requirements and restrictions apply:

- When using concatenated BZIP or GZIP files, verify that all source files terminate with a record terminator before concatenating them.
- Concatenated BZIP and GZIP files are not supported for NATIVE (binary) and NATIVE VARCHAR formats.
- LZO files are assumed to be compressed with `lzop` . Vertica supports the following [lzop arguments](#) :
 - `--no-checksum / -F`
 - `--crc32`
 - `--adler32`
 - `--no-name / -n`
 - `--name / -N`
 - `--no-mode`
 - `--no-time`
 - `--fast`
 - `--best`
 - Numbered compression levels
- BZIP , GZIP , ZSTD , and LZO compression cannot be used with ORC format.

VERTICA

See [COPY FROM VERTICA](#).

[WITH] UDL-clause [...]

Specifies one or more [user-defined load functions](#) —one source, and optionally one or more filters and one parser, as follows:

```
SOURCE source( [arg=value[...]] )
[ FILTER filter( [arg=value[...]] ) ]...
[ PARSER parser( [arg=value[...]] ) ]
```

To use a flex table parser for column tables, use the PARSER parameter followed by a flex table parser argument. For supported flex table parsers, see [Bulk loading data into flex tables](#).

Handling options

The following options control how COPY handles different contingencies:

ABORT ON ERROR

Specifies that COPY stops if any row is rejected. The statement is rolled back and no data is loaded.

COLSIZES (integer [...])

Specifies column widths when loading fixed-width data. COPY requires that you specify COLSIZES when using the FIXEDWIDTH parser. COLSIZES

and the list of integers must correspond to the columns listed in the table column list. For details, see [Fixed-width format data](#).

ERROR TOLERANCE

Specifies that COPY treats each source during execution independently when loading data. The statement is not rolled back if a single source is invalid. The invalid source is skipped and the load continues.

Using this parameter disables apportioned load.

Restrictions: Invalid for ORC or Parquet data

EXCEPTIONS { ' *path* ' [ON *nodename*] [...]

Exceptions, used in combination with **REJECTED DATA**, describe why each rejected row was rejected. Each exception row corresponds to a rejection row.

This option specifies the file name or absolute path of the output file for exceptions. If the file already exists, it is overwritten.

Files are written on the node or nodes executing the load or, if **ON** is used, on the designated node. You cannot specify a path on a shared file system or qualify the path with **ON ANY NODE**. For more information, see [Saving load exceptions \(EXCEPTIONS\)](#).

To collect exceptions together with the rejected rows, use **REJECTED DATA AS TABLE**. You cannot use **EXCEPTIONS** with **REJECTED DATA AS TABLE**.

If you use this option with COPY...ON ANY NODE, you must still specify the individual nodes for the exception files, as in the following example:

```
EXCEPTIONS 'home/ex01.txt' on v_db_node0001,'home/ex02.txt'  
on v_db_node0002,'home/ex03.txt' on v_db_node0003
```

If *path* resolves to a storage location, non-superusers have the following requirements:

- The storage location must be created with the USER option (see [CREATE LOCATION](#)).
- The user must have READ access to the storage location where the files exist, as described in [GRANT \(storage location\)](#).

REJECTED DATA { ' *path* ' [ON *nodename*] [...] | AS TABLE *reject-table*

Specifies where to write each row that failed to load. If this option is specified, records that failed due to parsing errors are always written. Records that failed due to an error during a transformation are written only if the [CopyFaultTolerantExpressions](#) configuration parameter is set.

Vertica can write rejected data to the local file system or to a table:

- Local file system: Vertica writes rejected row data to the specified path on the node or nodes executing the load or, if **ON** is used, on the designated node. You cannot specify a path on a shared file system or qualify the path with **ON ANY NODE**. To make rejected data available on all nodes, write rejections to a table.
The value of *path* can be a directory or a file prefix. If there are multiple load sources, *path* is always treated as a directory. If there are not multiple load sources but *path* ends with '/', or if a directory of that name already exists, it is also treated as a directory. Otherwise, *path* is treated as a file prefix.
If the output file already exists, it is overwritten.
When **REJECTED DATA** with a path is used with **LOCAL**, the output is written to the client.
- Table: Vertica writes rejected row data and exceptions to a table. You cannot use this option with **EXCEPTIONS**.
Writing rejections to a table is generally the better option, because they can then be queried from any node. If rejected data needs to be available from outside of Vertica, you can write it to a table and then export that table to a shared file system.

For more information about both options, see [Handling messy data](#).

REJECTMAX *integer*

The maximum number of logical records that can be rejected before a load fails. For details, see [Handling messy data](#).

REJECTMAX disables apportioned load.

SKIP *integer*

The number of records to skip in a load file. For example, you can use the SKIP option to omit table header information.

Restrictions: Invalid for ORC or Parquet data

STREAM NAME

Supplies a COPY load stream identifier. Using a stream name helps to quickly identify a particular load. The STREAM NAME value that you supply in the load statement appears in the STREAM_NAME column of system tables [LOAD_STREAMS](#) and [LOAD_SOURCES](#).

A valid stream name can contain any combination of alphanumeric or special characters up to 128 bytes in length.

For example:

```
=> COPY mytable FROM myfile
DELIMITER '|' STREAM NAME 'My stream name';
```

WITH *parser*

Specifies the parser to use when bulk loading columnar tables, one of the following:

- NATIVE
- NATIVE VARCHAR
- FIXEDWIDTH
- [ORC](#)
- [PARQUET](#)

By default, COPY uses the DELIMITER parser for UTF-8 format, delimited text input data. You do not specify the DELIMITER parser directly; absence of a specific parser indicates the default.

To use a flex table parser for column tables, use the PARSER parameter followed by a flex table parser argument. For supported flex table parsers, see [Bulk loading data into flex tables](#).

When loading into flex tables, you must use a compatible parser. For supported flex table parsers, see [Bulk loading data into flex tables](#).

COPY LOCAL does not support the NATIVE , NATIVE VARCHAR , ORC , and PARQUET parsers.

For parser support for complex data types, see the documentation of the specific parser.

For parser details, see [Data formats](#) in [Data load](#).

NO COMMIT

Prevents the COPY statement from committing its transaction automatically when it finishes copying data. This option must be the last COPY statement parameter. For details, see [Using transactions to stage a load](#).

This option is ignored by [CREATE EXTERNAL TABLE AS COPY](#).

Parser-specific options

The following options apply only when using specific parsers.

DELIMITED parser

DELIMITER

Indicates the single ASCII character used to separate columns within each record of a file. You can use any ASCII value in the range E'\000' to E'\177', inclusive. You cannot use the same character for both the DELIMITER and NULL parameters. For more information, see [Delimited data](#).

Default: Vertical bar ('|').

ENCLOSED [BY]

Sets the quote character within which to enclose data, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000'). By default, ENCLOSED BY has no value, meaning data is not enclosed by any sort of quote character.

ESCAPE [AS]

Sets the escape character. Once set, the character following the escape character is interpreted literally, rather than as a special character. You can define an escape character using any ASCII value in the range E'\001' to E'\177', inclusive (any ASCII character except NULL: E'\000').

The COPY statement does not interpret the data it reads in as [String literals](#). It also does not follow the same escape rules as other SQL statements (including the COPY parameters). When reading data, COPY interprets only the characters defined by these options as special values:

- ESCAPE [AS]
- DELIMITER
- ENCLOSED [BY]
- RECORD TERMINATOR
- All COLLECTION options

Default: Backslash ('').

NO ESCAPE

Eliminates escape-character handling. Use this option if you do not need any escape character and you want to prevent characters in your data from being interpreted as escape sequences.

RECORD TERMINATOR

Specifies the literal character string indicating the end of a data file record. For more information about using this parameter, see [Delimited data](#).

TRAILING NULLCOLS

Specifies that if Vertica encounters a record with insufficient data to match the columns in the table column list, COPY inserts the missing columns with NULL values. For other information and examples, see [Fixed-width format data](#).

COLLECTIONDELIMITER

For columns of collection types, indicates the single ASCII character used to separate elements within each collection. You can use any ASCII value in the range E'\000' to E'\177', inclusive. No COLLECTION option may have the same value as any other COLLECTION option. For more information, see [Delimited data](#).

Default: Comma (',').

COLLECTIONOPEN , COLLECTIONCLOSE

For columns of collection types, these options indicate the characters that mark the beginning and end of the collection. It is an error to use these characters elsewhere within the list of elements without escaping them. No COLLECTION option may have the same value as any other COLLECTION option.

Default: Square brackets ('[' and ']').

COLLECTIONNULLELEMENT

The string representing a null element value in a collection. You can specify a null value as any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII value except NULL: E'\000'). No COLLECTION option may have the same value as any other COLLECTION option. For more information, see [Delimited data](#).

Default: 'null'

COLLECTIONENCLOSE

For columns of collection types, sets the quote character within which to enclose individual elements, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'\001' to E'\177' inclusive (any ASCII character except NULL: E'\000'). No COLLECTION option may have the same value as any other COLLECTION option.

Default: double quote ('"')

FIXEDWIDTH parser

SKIP BYTES *integer*

The total number of bytes in a record to skip.

TRIM

Trims the number of bytes you specify from a column. This option is only available when loading fixed-width data. You can set TRIM at the table level for a column, or as part of the COLUMN OPTION parameter.

Restrictions

COPY has the following restrictions:

Invalid data

COPY considers the following data invalid:

- Missing columns (an input line has fewer columns than the recipient table).
- Extra columns (an input line has more columns than the recipient table).
- Empty columns for an INTEGER or DATE/TIME data type. If a column is empty for either of these types, COPY does not use the default value that was defined by [CREATE TABLE](#). However, if you do not supply a column option as part of the COPY statement, the default value is used.
- Incorrect representation of a data type. For example, trying to load a non-numeric value into an INTEGER column is invalid.

Constraint violations

If primary key, unique key, or check constraints are enabled for automatic enforcement in the target table, Vertica enforces those constraints when you load new data. If a violation occurs, Vertica rolls back the operation and returns an error.

Empty line handling

When COPY encounters an empty line while loading data, the line is neither inserted nor rejected, but COPY increments the line record number. Consider this behavior when evaluating rejected records. If you return a list of rejected records and COPY encountered an empty row while loading data, the position of rejected records is not incremented by one, as demonstrated in the following example.

The example first loads values into a table that defines the first column as INT. Note the errors on rows 3, 4, and 8:

```
=> \! cat -n /home/dbadmin/test.txt
 1 1|A|2
 2 2|B|4
 3 A|D|7
 4 A|E|7
 5
 6
 7 6|A|3
 8 B|A|3
```

The empty rows (5 and 6) shift the reporting of the error on row 8:

```
=> SELECT row_number, rejected_data, rejected_reason FROM test_bad;
row_number | rejected_data | rejected_reason
-----+-----+-----
      3 | A|D|7 | Invalid integer format 'A' for column 1 (c1)
      4 | A|E|7 | Invalid integer format 'A' for column 1 (c1)
      6 | B|A|3 | Invalid integer format 'B' for column 1 (c1)
(3 rows)
```

Compressed file errors

When loading compressed files, **COPY** might abort and report an error, if the file seems to be corrupted. For example, this behavior can occur if reading the header block fails.

Disk quota

Tables and schemas can have disk quotas. If a load would violate either quota, the operation fails. For more information, see [Disk quotas](#).

Parsers

Vertica supports several parsers to load different types of data. Some parsers are for use only with flex tables, as noted.

In this section

- [DELIMITED](#)
- [FAVROPARSER](#)
- [FCEFPARSER](#)
- [FCSVPARSER](#)
- [FDELIMITEDPAIRPARSER](#)
- [FDELIMITEDPARSER](#)
- [FJSONPARSER](#)
- [FREGEXPARSER](#)
- [ORC](#)
- [PARQUET](#)

DELIMITED

Use the DELIMITED parser, which is the default, to load delimited text data using [COPY](#). You can specify the delimiter, escape characters, how to handle null values, and other parameters.

The DELIMITED parser supports both [apportioned load and cooperative parse](#).

COPY options

The following options are specific to this parser. See [Parameters](#) for other applicable options.

DELIMITER

Indicates the single ASCII character used to separate columns within each record of a file. You can use any ASCII value in the range E'000' to E'177', inclusive. You cannot use the same character for both the DELIMITER and NULL parameters. For more information, see [Delimited data](#).

Default: Vertical bar ('|').

ENCLOSED [BY]

Sets the quote character within which to enclose data, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'001' to E'177' inclusive (any ASCII character except NULL: E'000'). By default, ENCLOSED BY has no value, meaning data is not enclosed by any sort of quote character.

ESCAPE [AS]

Sets the escape character. Once set, the character following the escape character is interpreted literally, rather than as a special character. You can define an escape character using any ASCII value in the range E'001' to E'177', inclusive (any ASCII character except NULL: E'000'). The COPY statement does not interpret the data it reads in as [String literals](#). It also does not follow the same escape rules as other SQL statements (including the COPY parameters). When reading data, COPY interprets only the characters defined by these options as special values:

- ESCAPE [AS]
- DELIMITER
- ENCLOSED [BY]
- RECORD TERMINATOR
- All COLLECTION options

Default: Backslash ('').

NO ESCAPE

Eliminates escape-character handling. Use this option if you do not need any escape character and you want to prevent characters in your data from being interpreted as escape sequences.

RECORD TERMINATOR

Specifies the literal character string indicating the end of a data file record. For more information about using this parameter, see [Delimited data](#).

TRAILING NULLCOLS

Specifies that if Vertica encounters a record with insufficient data to match the columns in the table column list, COPY inserts the missing columns with NULL values. For other information and examples, see [Fixed-width format data](#).

COLLECTIONDELIMITER

For columns of collection types, indicates the single ASCII character used to separate elements within each collection. You can use any ASCII value in the range E'000' to E'177', inclusive. No COLLECTION option may have the same value as any other COLLECTION option. For more information, see [Delimited data](#).

Default: Comma (',').

COLLECTIONOPEN , COLLECTIONCLOSE

For columns of collection types, these options indicate the characters that mark the beginning and end of the collection. It is an error to use these characters elsewhere within the list of elements without escaping them. No COLLECTION option may have the same value as any other COLLECTION option.

Default: Square brackets ('[' and ']').

COLLECTIONNULLELEMENT

The string representing a null element value in a collection. You can specify a null value as any ASCII value in the range E'001' to E'177' inclusive (any ASCII value except NULL: E'000'). No COLLECTION option may have the same value as any other COLLECTION option. For more information, see [Delimited data](#).

Default: 'null'

COLLECTIONENCLOSE

For columns of collection types, sets the quote character within which to enclose individual elements, allowing delimiter characters to be embedded in string values. You can choose any ASCII value in the range E'001' to E'177' inclusive (any ASCII character except NULL: E'000'). No COLLECTION option may have the same value as any other COLLECTION option.

Default: double quote ('"')

Data types

The DELIMITED parser supports reading one-dimensional collections (arrays or sets) of scalar types.

If the total size of an array exceeds the size defined by the target table, the parser rejects the row.

Examples

The following example shows the default behavior, in which the delimiter character is '|'

```
=> CREATE TABLE employees (id INT, name VARCHAR(50), department VARCHAR(50));
CREATE TABLE

=> COPY employees FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 42|Sheldon Cooper|Physics
>> 17|Howard Wolowitz|Astronomy
>> \.

=> SELECT * FROM employees;
id | name | department
-----+-----
17 | Howard Wolowitz | Astrophysics
42 | Sheldon Cooper | Physics
(2 rows)
```

The following example shows loading array values with the default options.

```
=> CREATE TABLE researchers (id INT, name VARCHAR, grants ARRAY[VARCHAR], values ARRAY[INT]);
CREATE TABLE

=> COPY researchers FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 42|Sheldon Cooper|[US-7376,DARPA-1567]|[65000,135000]
>> 17|Howard Wolowitz|[NASA-1683,NASA-7867,SPX-76]|[16700,85000,45000]
>> \.

=> SELECT * FROM researchers;
id | name | grants | values
-----+-----+-----
17 | Howard Wolowitz | ["NASA-1683","NASA-7867","SPX-76"] | [16700,85000,45000]
42 | Sheldon Cooper | ["US-7376","DARPA-1567"] | [65000,135000]
(2 rows)
```

In the following example, collections are enclosed in braces and delimited by periods, and the arrays contain null values.

```
=> COPY researchers FROM STDIN COLLECTIONOPEN '{' COLLECTIONCLOSE '}' COLLECTIONDELIMITER '.';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 19|Leonard|{"us-1672".null."darpa-1963"}{16200.null.16700}
>> \.

=> SELECT * FROM researchers;
id | name | grants | values
-----+-----+-----
17 | Howard Wolowitz | ["NASA-1683","NASA-7867","SPX-76"] | [16700,85000,45000]
42 | Sheldon Cooper | ["US-7376","DARPA-1567"] | [65000,135000]
19 | Leonard | ["us-1672",null,"darpa-1963"] | [16200,null,16700]
(3 rows)
```

FAVROPARSER

Parses data from an Avro file. The following requirements apply:

- Avro files must be encoded in the Avro binary serialization encoding format, described in the [Apache Avro standard](#). The parser also supports Snappy and deflate compression.
- FAVROPARSER does not support Avro files with separate schema files. The Avro file must include the schema.

You can load [complex types](#) in the Avro source (arrays, structs, or combinations) with strong typing or as [flexible complex types](#). A flexible complex type is loaded into a VMap column, as in flex tables. To load complex types as VMap columns, specify a column type of LONG VARBINARY . To preserve the indexing in complex types, set `flatten_maps` to false.

This parser can notify you if it finds keys in the data that are not part of the table definition. See [Unmatched Keys](#).

When loading into a flex table, Vertica loads all data into the `__raw__` (VMap) column, including complex types found in the data.

This parser does not support [apportioned load or cooperative parse](#).

Syntax

```
FAVROPARSER ( [parameter=value[,...]] )
```

Parameters

`flatten_maps`

Boolean, whether to flatten all Avro maps. Key names are concatenated with nested levels. This value is recursive and affects all data in the load.

This parameter applies only to flex tables or VMap columns and is ignored when loading strongly-typed complex types.

Default: true

`flatten_arrays`

Boolean, whether to flatten all Avro arrays. Key names are concatenated with nested levels. This value is recursive and affects all data in the load.

This parameter applies only to flex tables or VMap columns and is ignored when loading strongly-typed complex types.

Default: false

`flatten_records`

Boolean, whether to flatten all Avro records. Key names are concatenated with nested levels. This value is recursive and affects all data in the load.

This parameter applies only to flex tables or VMap columns and is ignored when loading strongly-typed complex types.

Default: true

`reject_on_materialized_type_error`

Boolean, whether to reject a data row that contains a materialized column value that cannot be coerced into a compatible data type. If the value is false and the type cannot be coerced, the parser sets the value in that column to NULL.

If the column is an array and the data to be loaded is too large, then false sets the column value to NULL and true rejects the row.

If the column is a strongly-typed [complex type](#), as opposed to a [flexible complex type](#), then a type mismatch anywhere in the complex type causes the entire column to be treated as a mismatch. The parser does not partially load complex types.

Default: false

`suppress_warnings`

String, which warnings to suppress:

- `unmatched_key` (see [Unmatched Keys](#))
- `true` or `t` (suppress all warnings)
- `false` or `f` (do not suppress warnings)

Default: false

Primitive data types

FAVROPARSER supports the following primitive data types, including as element types and field values in complex types.

AVRO Data Type	Vertica Data Type	Value
NULL	NULL value	No value
boolean	Boolean data type	A binary value
int	INTEGER	32-bit signed integer

long	INTEGER	64-bit signed integer
float	DOUBLE PRECISION (FLOAT) Synonymous with 64-bit IEEE FLOAT	Single precision (32-bit) IEEE 754 floating-point number
double	DOUBLE PRECISION (FLOAT)	Double precision (64-bit) IEEE 754 floating-point number
bytes	VARBINARY	Sequence of 8-bit unsigned bytes
string	VARCHAR	Unicode character sequence

Note

Vertica does not have an explicit 4-byte (32-bit integer) or smaller types. Instead, Vertica encoding and compression automatically eliminate the storage overhead of values that require less than 64 bits.

Avro logical types

FAVROPARSER supports the following Avro logical types. The target column must use a Vertica data type that supports the logical type. When you attempt to load data using an invalid logical type, the logical type is ignored and the underlying Avro type is used.

AVRO Logical Type	Base Avro Type	Supported Vertica Data Types
decimal $0 < \textit{precision} \leq 1024$ $0 \leq \textit{scale} \leq \textit{precision}$	bytes or fixed	NUMERIC , Character Vertica rejects the value if: <ul style="list-style-type: none"> The Avro precision setting is greater than the precision setting for the target column. For fixed types, the precision value is greater than what is allowed by the size attribute. If the data type for the target column uses the default precision setting, the precision setting in the Avro schema overrides the default.
date	integer	DATE , Character
time-micros	long	TIME/TIMETZ , Character
time-millis	int	The time logical type does not provide a time zone value. For target columns that use the TIMETZ data type, Vertica uses UTC as the default.
timestamp-micros	long	TIMESTAMP/TIMESTAMP TZ , TIME/TIMETZ
timestamp-millis	long	For timestamp-millis only, the timezone is included and is represented as an offset to UTC. Additionally, the millisecond values are right-extended with padded zeros.
duration	fixed	INTERVAL , Character

Avro complex data types

The Avro format supports several complex data types. When loading into strongly-typed columns, you can use the [ROW](#) and [ARRAY](#) types to represent them. For example, Avro Record and Enums are structs (ROWS); see the [Avro specification](#).

You can use ARRAY[ROW] to match an Avro map. You must name the ROW fields **key** and **value**. These are the names that the Avro format uses for those fields in the data, and the parser relies on field names to match data to table columns.

If the total size of an array exceeds the size defined by the target table, the parser sets the value to null.

When loading into flex tables or using flexible complex types, this parser handles Avro complex types as follows:

Record

The name of each field is used as a virtual column name. If `flatten_records` is true and several nesting levels are present, Vertica concatenates the record names to create the key name.

Map

The value of each map key is used as a virtual column name. If `flatten_maps` is true and several nesting levels are present, Vertica concatenates the key names to create the key name.

Enum

Vertica treats Avro Enums like records, with the name of the Enum as the key and the value as the value.

Array

Vertica treats Avro Arrays as key/value pairs. By default, the index of each element is the key. In the following example, `product_detail` is a Record with a field, `product_category`, that is an Array:

```
=> CREATE FLEX TABLE products;
CREATE TABLE

=> COPY products FROM :datafile WITH PARSER FAVROPARSER();
Rows Loaded
-----
      2
(1 row)

=> SELECT MAPTOSTRING(__raw__) FROM products ORDER BY __identity__;
-----
maptostring
-----
{
  "__name__": "Order",
  "customer_id": "111222",
  "order_details": {
    "0.__name__": "OrderDetail",
    "0.product_detail.__name__": "Product",
    "0.product_detail.price": "46.21",
    "0.product_detail.product_category": {
      "0": "electronics",
      "1": "printers",
      "2": "computers"
    },
    "0.product_detail.product_description": "hp printer X11ew description \
P",
    "0.product_detail.product_hash": "\u0000\u0001\u0002\u0003\u0004",
    "0.product_detail.product_id": "999012",
    "0.product_detail.product_map.one": "1.1",
    "0.product_detail.product_map.two": "1.1",
    "0.product_detail.product_name": "hp printer X11ew",
    "0.product_detail.product_status": "ONLY_FEW_LEFT",
    "0.quantity": "3",
    "0.total": "354.34"
  },
  "order_id": "2389646",
  "total": "132.43"
}
...
```

If `flatten_arrays` is true and several nesting levels are present, Vertica concatenates the indices to create the key name.

```
=> COPY products FROM :datafile WITH PARSER FAVROPARSER(flatten_arrays=true);
```

Rows Loaded

```
-----  
      2  
(1 row)
```

```
=> SELECT MAPTOSTRING(__raw__) FROM products ORDER BY __identity__;  
      maptostring
```

```
-----  
{  
  "__name__": "Order",  
  "customer_id": "111222",  
  "order_details.0.__name__": "OrderDetail",  
  "order_details.0.product_detail.__name__": "Product",  
  "order_details.0.product_detail.price": "46.21",  
  "order_details.0.product_detail.product_category.0": "electronics",  
  "order_details.0.product_detail.product_category.1": "printers",  
  "order_details.0.product_detail.product_category.2": "computers",  
  "order_details.0.product_detail.product_description": "hp printer X11ew des\ncription :P",  
  "order_details.0.product_detail.product_hash": "\u0000\u0001\u0002\u0003\u0004",  
  "order_details.0.product_detail.product_id": "999012",  
  "order_details.0.product_detail.product_map.one": "1.1",  
  "order_details.0.product_detail.product_map.two": "1.1",  
  "order_details.0.product_detail.product_name": "hp printer X11ew",  
  "order_details.0.product_detail.product_status": "ONLY_FEW_LEFT",  
  "order_details.0.quantity": "3",  
  "order_details.0.total": "354.34",  
  "order_id": "2389646",  
  "total": "132.43"  
}
```

Union

Vertica treats Avro Unions as arrays.

Unmatched keys

Data being loaded can contain keys that are not part of the table definition. If you are loading into a flex table (or a flexible complex type column), no data is lost. For a table with strongly-defined columns, however, new keys cannot be loaded because the table does not have a place to put them.

This parser emits warnings if it finds new keys and if both of the following are true:

- The target table is not a flex table.
- The new key is not nested within a flexible complex type column.

New keys are logged in the [UDX_EVENTS](#) system table. If a new key is a complex type with nested keys, only the top-level key is logged. When you see a warning about unmatched keys, you can query this table and then use [ALTER TABLE](#) to modify your table definition for future loads.

Querying an external table loads data and thus can trigger these warnings. To prevent them, set the `suppress_warnings` parameter to 'unmatched_keys' or 'true':

```
=> CREATE EXTERNAL TABLE restaurants(  
      name VARCHAR(50),  
      menu ARRAY[ROW(item VARCHAR(50), price NUMERIC(8,2)),100])  
AS COPY FROM '/data/rest.json'  
PARSER FAVROPARSER(suppress_warnings='unmatched_key');
```

Examples

This example shows how to create and load a flex table with Avro data using `favroparser`. After loading the data, you can query virtual columns:

```

=> CREATE FLEX TABLE avro_basic();
CREATE TABLE

=> COPY avro_basic FROM '/home/dbadmin/data/weather.avro' PARSER FAVROPARSER();
Rows Loaded
-----
5
(1 row)

=> SELECT station, temp, time FROM avro_basic;
station | temp | time
-----+-----+-----
mohali | 0 | -619524000000
lucknow | 22 | -619506000000
norwich | -11 | -619484400000
ams | 111 | -655531200000
baddi | 78 | -655509600000
(5 rows)

```

For more information, see [Avro data](#).

FCEFPARSER

Parses ArcSight Common Event Format (CEF) log files. This parser loads values directly into any table column with a column name that matches a source data key. The parser stores the data loaded into a flex table in a single VMap.

This parser is for use in Flex tables only. All flex parsers store the data as a single VMap in the `LONG VARBINAR_raw__` column. If a data row is too large to fit in the column, it is rejected. Vertica supports null values for loading data with NULL -specified columns.

Syntax

```
FCEFPARSER ( [parameter-name='value'[,...]] )
```

Parameters

delimiter

Single-character delimiter.

Default: `'`

record_terminator

Single-character record terminator.

Default: `****value: **` `newline`

trim

Boolean, specifies whether to trim white space from header names and key values.

Default: `true`

reject_on_unescaped_delimiter

Boolean, specifies whether to reject rows containing unescaped delimiters. The CEF standard does not permit them.

Default: `false`

Examples

The following example illustrates creating a sample flex table for CEF data, with two real columns, `eventId` and `priority`.

1. Create a flex table `cefdata` :

```

=> create flex table cefdata();
CREATE TABLE

```

2. Load some basic CEF data, using the flex parser `fcefparser` :

```
=> copy cefdata from stdin parser fcefparser();
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> CEF:0|ArcSight|ArcSight|2.4.1|machine:20|New alert|High|
>> \.
```

3. Use the `maptostring()` function to view the contents of your `cefdata` flex table:

```
=> select maptostring(__raw__) from cefdata;
      maptostring
-----
{
  "deviceproduct" : "ArcSight",
  "devicevendor" : "ArcSight",
  "deviceversion" : "2.4.1",
  "name" : "New alert",
  "severity" : "High",
  "signatureid" : "machine:20",
  "version" : "0"
}
(1 row)
```

4. Select some virtual columns from the `cefdata` flex table:

```
= select deviceproduct, severity, deviceversion from cefdata;
deviceproduct | severity | deviceversion
-----+-----+-----
ArcSight      | High    | 2.4.1
(1 row)
```

For more information, see [Common event format \(CEF\) data](#)

- [FJSONPARSER](#)
- [FREGEXPARSER](#)

FCSVPARSER

Parses CSV format (comma-separated values) data. Use this parser to load CSV data into columnar, flex, and hybrid tables. All data must be encoded in Unicode UTF-8 format. The `fcsvparser` parser supports the [RFC 4180](#) standard for CSV data, and other options, to accommodate variations in CSV file format definitions. Invalid records are rejected. For more information about data formats, see [Handling Non-UTF-8 input](#).

This parser is for use in Flex tables only. All flex parsers store the data as a single VMap in the `LONG VARBINAR_raw__` column. If a data row is too large to fit in the column, it is rejected. Vertica supports null values for loading data with NULL -specified columns.

Syntax

```
FCSVPARSER ( [parameter='value'[,...]] )
```

Parameters

type

The default parameter values for the parser, one of the following strings:

- `rfc4180`
- `traditional`

You do not have to use the type parameter when loading data that conforms to the RFC 4180 standard (such as MS Excel files). See [Loading CSV data](#) for the `RF4180` default parameters, and other options you can specify for traditional CSV files.

Default: `RF4180`

delimiter

A single-character value used to separate fields in the CSV data.

Default: , (for [rfc4180](#) and [traditional](#))

escape

A single-character value used as an escape character to interpret the next character in the data literally.

Default:

- [rfc4180](#) : "
- [traditional](#) : \

enclosed_by

A single-character value. Use [enclosed_by](#) to include a value that is identical to the delimiter, but should be interpreted literally. For example, if the data delimiter is a comma (,), and you want to use a comma within the data ("my name is jane, and his is jim").

Default: "

record_terminator

A single-character value used to specify the end of a record.

Default:

- [rfc4180](#) : \n
- [traditional](#) : \r\n

header

Boolean, specifies whether to use the first row of data as a header column. When [header=true](#) (default), and no header exists, `fcsvparser` uses a default column heading. The default header consists of `ucol n`, where `n` is the column offset number, starting with `0` for the first column. You can specify custom column heading names using the [header_names](#) parameter, described next.

If you specify [header=false](#) , the `fcsvparser` parses the first row of input as data, rather than as column headers.

Default: true

header_names

A list of column header names, delimited by the character defined by the parser's [delimiter](#) parameter. Use this parameter to specify header names in a CSV file without a header row, or to override the column names present in the CSV source. To override one or more existing column names, specify the header names to use. This parameter overrides any header row in the data.

trim

Boolean, specifies whether to trim white space from header names and key values.

Default: true

omit_empty_keys

Boolean, specifies how the parser handles header keys without values. If true, keys with an empty value in the [header](#) row are not loaded.

Default: false

reject_on_duplicate

Boolean, specifies whether to ignore duplicate records (false), or to reject duplicates (true). In either case, the load continues.

Default: false

reject_on_empty_key

Boolean, specifies whether to reject any row containing a key without a value.

Default: false

reject_on_materialized_type_error

Boolean, specifies whether to reject any materialized column value that the parser cannot coerce into a compatible data type. See [Loading CSV data](#).

Default: false

Examples

The following example loads data that complies with RFC 4180:

```

-> CREATE TABLE sample(a INT, b VARCHAR, c INT);
CREATE TABLE

-> COPY sample FROM stdin PARSER FCSVPARSER(header='false');
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 10,10,20
>> 10,"10",30
>> 10,"20""5",90
>> \.

-> SELECT * FROM sample;
 a | b | c
-----+-----+-----
 10 | 10 | 20
 10 | 10 | 30
 10 | 20"5 | 90
(3 rows)

```

Note the value `20"5`, which came from the input `"20""5"`. Per [RFC 4180](#), to include a double-quote character in a string, you must double-quote the entire string and then escape the double-quote with another double-quote.

For more information and examples using other parameters of this parser, see [Loading CSV data](#).

- [FDELIMITEDPARSER](#)
- [FDELIMITEDPAIRPARSER](#)
- [FJSONPARSER](#)
- [FREGEXPARSER](#)

FDELIMITEDPAIRPARSER

Parses delimited data files. This parser provides a subset of the functionality in the parser `fdelimitedparser`. Use the `fdelimitedpairparser` when the data you are loading specifies pairs of column names with data in each row.

This parser is for use in Flex tables only. All flex parsers store the data as a single VMap in the `LONG VARBINAR_raw__` column. If a data row is too large to fit in the column, it is rejected. Vertica supports null values for loading data with NULL -specified columns.

Syntax

```
FDELIMITEDPAIRPARSER ( [parameter-name='value'[,...]] )
```

Parameters

delimiter

Specifies a single-character delimiter.

Default: `'`

record_terminator

Specifies a single-character record terminator.

Default: `newline`

trim

Boolean specifies whether to trim white space from header names and key values.

Default: `true`

Examples

The following example illustrates creating a sample flex table for simple delimited data, with two real columns, `eventId` and `priority`.

1. Create a table:

```
=> create flex table CEFData(eventId int default(eventId::int), priority int default(priority::int) );  
CREATE TABLE
```

2. Load a sample delimited OpenText ArcSight log file into the **CEFData** table, using the **fcefparser** :

```
=> copy CEFData from '/home/release/kmm/flextables/sampleArcSight.txt' parser fdelimitedpairparser();  
Rows Loaded | 200
```

3. After loading the sample data file, use **maptostring()** to display the virtual columns in the **__raw__** column of **CEFData** :

```
=> select maptostring(__raw__) from CEFData limit 1;  
maptostring

- [FREGEXPARSER](#)

FDELIMITEDPARSER

Parses data using a delimiter character to separate values. The **fdelimitedparser** loads delimited data, storing it in a single-value VMap.

This parser is for use in Flex tables only. All flex parsers store the data as a single VMap in the **LONG VARBINAR_raw__** column. If a data row is too large to fit in the column, it is rejected. Vertica supports null values for loading data with NULL -specified columns.

Note

By default, **fdelimitedparser** treats empty fields as **NULL**, rather than as an empty string (""). This behavior makes casting easier. Casting a NULL

to an integer (`NULL::int`) is valid, while casting an empty string to an integer (`""::int`) is not. If required, use the `treat_empty_val_as_null` parameter to change the default behavior of `fdelimitedparser` .

Syntax

```
FDLIMITEDPARSER ( [parameter-name='value'[,...]] )
```

Parameters

delimiter

Single character delimiter.

Default: |

record_terminator

Single-character record terminator.

Default: \n

trim

Boolean, specifies whether to trim white space from header names and key values.

Default: true

header

Boolean, specifies that a header column exists. The parser uses `col###` for the column names if you use this parameter but no header exists.

Default: true

omit_empty_keys

Boolean, specifies how the parser handles header keys without values. If `omit_empty_keys=true` , keys with an empty value in the `header` row are not loaded.

Default: false

reject_on_duplicate

Boolean, specifies whether to ignore duplicate records (`false`), or to reject duplicates (`true`). In either case, the load continues.

Default: false

reject_on_empty_key

Boolean, specifies whether to reject any row containing a key without a value.

Default: false

reject_on_materialized_type_error

Boolean, specifies whether to reject any row value for a materialized column that the parser cannot coerce into a compatible data type. See [Using flex table parsers](#) .

Default: false

treat_empty_val_as_null

Boolean, specifies that empty fields become `NULLs` , rather than empty strings (`"`).

Default: true

Examples

1. Create a flex table for delimited data:

```
t=> CREATE FLEX TABLE delim_flex ();  
CREATE TABLE
```

2. Use the `fdelimitedparser` to load some delimited data from `STDIN` , specifying a comma (`,`) column delimiter:

```
=> COPY delim_flex FROM STDIN parser fdelimitedparser (delimiter=',');  
Enter data to be copied followed by a newline.  
End with a backslash and a period on a line by itself.  
>> deviceproduct, severity, deviceversion  
>> ArcSight, High, 2.4.1  
>> \.
```

You can now query virtual columns in the `delim_flex` flex table:

```
=> SELECT deviceproduct, severity, deviceversion from delim_flex;
deviceproduct | severity | deviceversion
-----+-----+-----
ArcSight      | High    | 2.4.1
(1 row)
```

- [FJSONPARSER](#)
- [FREGEXPARSER](#)

FJSONPARSER

Parses and loads a JSON file. This file can contain either repeated JSON data objects (including nested maps), or an outer list of JSON elements.

When loading into a flex or hybrid table, the parser stores the JSON data in a single-value VMap. When loading into a hybrid or columnar table, the parser loads data directly into any table column with a column name that matches a key in the JSON source data.

You can load [complex types](#) in the JSON source (arrays, structs, or combinations) with strong typing or as [flexible complex types](#). A flexible complex type is loaded into a VMap column, as in flex tables. To load complex types as VMap columns, specify a column type of LONG VARBINARY . To preserve the indexing in complex types, set `flatten_maps` to false.

This parser can notify you if it finds keys in the data that are not part of the table definition. See [Unmatched Keys](#).

FJSONPARSER supports [cooperative parse](#) only if `record_terminator` is specified. It does not support [apportioned load](#).

Syntax

```
FJSONPARSER ( [parameter=value[,...]] )
```

Parameters

flatten_maps

Boolean, whether to flatten sub-maps within the JSON data, separating map levels with a period (.). This value affects all data in the load, including nested maps.

This parameter applies only to flex tables or VMap columns and is ignored when loading strongly-typed complex types.

Default: true

flatten_arrays

Boolean, whether to convert lists to sub-maps with integer keys. When lists are flattened, key names are concatenated as for maps. Lists are not flattened by default. This value affects all data in the load, including nested lists.

This parameter applies only to flex tables or VMap columns and is ignored when loading strongly-typed complex types.

Default: false

reject_on_duplicate

Boolean, whether to ignore duplicate records (false), or to reject duplicates (true). In either case, the load continues.

Default: false

reject_on_empty_key

Boolean, whether to reject any row containing a field key without a value.

Default: false

omit_empty_keys

Boolean, whether to omit any field key from the data that does not have a value. Other fields in the same record are loaded.

Default: false

record_terminator

When set, any invalid JSON records are skipped and parsing continues with the next record. Records must be terminated uniformly. For

example, if your input file has JSON records terminated by newline characters, set this parameter to `E'\n'` . If any invalid JSON records exist, parsing continues after the next `record_terminator` .

Even if the data does not contain invalid records, specifying an explicit record terminator can improve load performance by allowing cooperative parse and apportioned load to operate more efficiently.

When you omit this parameter, parsing ends at the first invalid JSON record.

reject_on_materialized_type_error

Boolean, whether to reject a data row that contains a materialized column value that cannot be coerced into a compatible data type. If the value is false and the type cannot be coerced, the parser sets the value in that column to NULL.

If the column is an array and the data to be loaded is too large, then false sets the column value to NULL and true rejects the row.

If the column is a strongly-typed [complex type](#), as opposed to a [flexible complex type](#), then a type mismatch anywhere in the complex type causes the entire column to be treated as a mismatch. The parser does not partially load complex types.

Default: false

start_point

String, the name of a key in the JSON load data at which to begin parsing. The parser ignores all data before the `start_point` value. The value is loaded for each object in the file. The parser processes data after the first instance, and up to the second, ignoring any remaining data.

start_point_occurrence

Integer, the *n* th occurrence of the value you specify with `start_point` . Use in conjunction with `start_point` when the data has multiple start values and you know the occurrence at which to begin parsing.

Default: 1

suppress_nonalphanumeric_key_chars

Boolean, whether to suppress non-alphanumeric characters in JSON key values. The parser replaces these characters with an underscore (`_`) when this parameter is true.

Default: false

key_separator

Character for the parser to use when concatenating key names.

Default: period (`.`)

suppress_warnings

String, which warnings to suppress:

- `unmatched_key` (see [Unmatched Keys](#))
- `true` or `t` (suppress all warnings)
- `false` or `f` (do not suppress warnings)

Default: false

Data types

If the total size of an array exceeds the size defined by the target table, the parser sets the value to null.

Unmatched keys

Data being loaded can contain keys that are not part of the table definition. If you are loading into a flex table (or a flexible complex type column), no data is lost. For a table with strongly-defined columns, however, new keys cannot be loaded because the table does not have a place to put them.

This parser emits warnings if it finds new keys and if both of the following are true:

- The target table is not a flex table.
- The new key is not nested within a flexible complex type column.

New keys are logged in the [UDX_EVENTS](#) system table. If a new key is a complex type with nested keys, only the top-level key is logged. When you see a warning about unmatched keys, you can query this table and then use [ALTER TABLE](#) to modify your table definition for future loads.

Querying an external table loads data and thus can trigger these warnings. To prevent them, set the `suppress_warnings` parameter to `'unmatched_keys'` or `'true'`:

```
=> CREATE EXTERNAL TABLE restaurants(
    name VARCHAR(50),
    menu ARRAY[ROW(item VARCHAR(50), price NUMERIC(8,2)),100]
AS COPY FROM '/data/rest.json'
PARSER FJSONPARSER(suppress_warnings='unmatched_key');
```

Examples

The following example loads JSON data from STDIN using the default parameters:

```
=> CREATE TABLE people(age INT, name VARCHAR);
CREATE TABLE

=> COPY people FROM STDIN PARSER FJSONPARSER();
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> {"age": 5, "name": "Tim"}
>> {"age": 3}
>> {"name": "Fred"}
>> {"name": "Bob", "age": 10}
>> \.
=> SELECT * FROM people;
age | name
-----+-----
    | Fred
10 | Bob
 5 | Tim
 3 |
(4 rows)
```

The following example uses the [reject_on_duplicate](#) parameter to reject duplicate values:

```
=> CREATE FLEX TABLE json_dupes();
CREATE TABLE
=> COPY json_dupes FROM stdin PARSER fjsonparser(reject_on_duplicate=true)
exceptions '/home/dbadmin/load_errors/json_e.out'
rejected data '/home/dbadmin/load_errors/json_r.out';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> {"a":"1","a":"2","b":"3"}
>> \.
=> \!cat /home/dbadmin/load_errors/json_e.out
COPY: Input record 1 has been rejected (Rejected by user-defined parser).
Please see /home/dbadmin/load_errors/json_r.out, record 1 for the rejected record.
COPY: Loaded 0 rows, rejected 1 rows.
```

The following example loads array data:

```
$ cat addr.json
{"number": 301, "street": "Grant", "attributes": [1, 2, 3, 4]}

=> CREATE EXTERNAL TABLE customers(number INT, street VARCHAR, attributes ARRAY[INT])
AS COPY FROM 'addr.json' PARSER fjsonparser();

=> SELECT number, street, attributes FROM customers;
num | street| attributes
-----+-----
301 | Grant | [1,2,3,4]
(1 row)
```

The following example loads a flexible complex type, rejecting rows that have empty keys within the nested records. Notice that while the data has two restaurants, one has a key name that is an empty string. This one is rejected:

```

$ cat rest1.json
{
  "name" : "Bob's pizzeria",
  "cuisine" : "Italian",
  "location_city" : ["Cambridge", "Pittsburgh"],
  "menu" : [{"item" : "cheese pizza", "" : "$8.25"},
            {"item" : "spinach pizza", "price" : "$10.50"}]
}
{
  "name" : "Bakersfield Tacos",
  "cuisine" : "Mexican",
  "location_city" : ["Pittsburgh"],
  "menu" : [{"item" : "veggie taco", "price" : "$9.95"},
            {"item" : "steak taco", "price" : "$10.95"}]
}

=> CREATE TABLE rest (name VARCHAR, cuisine VARCHAR, location_city LONG VARBINARY, menu LONG VARBINARY);

=> COPY rest FROM '/data/rest1.json'
  PARSER fjsonparser(flatten_maps=false, reject_on_empty_key=true);
Rows Loaded
-----
   1
(1 row)

=> SELECT maptostring(location_city), maptostring(menu) FROM rest;
  maptostring      |      maptostring
-----+-----
{
  "0": "Pittsburgh"
} | {
  "0": {
    "item": "veggie taco",
    "price": "$9.95"
  },
  "1": {
    "item": "steak taco",
    "price": "$10.95"
  }
}
(1 row)

```

To instead load partial data, use [omit_empty_keys](#) to bypass the missing keys while loading everything else:

```
=> COPY rest FROM '/data/rest1.json'
  PARSE fjsonparser(flatten_maps=false, omit_empty_keys=true);
```

Rows Loaded

```
-----
      2
(1 row)
```

```
=> SELECT maptostring(location_city), maptostring(menu) from rest;
      maptostring      |      maptostring
```

```
-----+-----
{
  "0": "Pittsburgh"
} | {
  "0": {
    "item": "veggie taco",
    "price": "$9.95"
  },
  "1": {
    "item": "steak taco",
    "price": "$10.95"
  }
}
{
  "0": "Cambridge",
  "1": "Pittsburgh"
} | {
  "0": {
    "item": "cheese pizza"
  },
  "1": {
    "item": "spinach pizza",
    "price": "$10.50"
  }
}
(2 rows)
```

To instead load this data with strong typing, define the complex types in the table:

```
=> CREATE EXTERNAL TABLE restaurants
(name VARCHAR, cuisine VARCHAR,
 location_city ARRAY[VARCHAR(80)],
 menu ARRAY[ ROW(item VARCHAR(80), price FLOAT) ]
)
AS COPY FROM '/data/rest.json' PARSE fjsonparser();
```

```
=> SELECT * FROM restaurants;
```

```
name | cuisine | location_city | \
menu
-----+-----+-----\
-----
Bob's pizzeria | Italian | ["Cambridge", "Pittsburgh"] | [{"item": "cheese pi\
zza", "price": 0.0}, {"item": "spinach pizza", "price": 0.0}]
Bakersfield Tacos | Mexican | ["Pittsburgh"] | [{"item": "veggie ta\
co", "price": 0.0}, {"item": "steak taco", "price": 0.0}]
(2 rows)
```

In the following example, the data contains two new fields. One is a top-level field (a new column), and the other is a new field on an existing struct. The new fields are recorded in the [UDX_EVENTS](#) system table:

```

=> COPY rest FROM '/data/rest2.json' PARSER FJSONPARSER();
WARNING 10596: Warning in UDX call in user-defined object [FJSONParser], code: 0, message:
Data source contained keys which did not match table schema
HINT: SELECT key, sum(num_instances) FROM v_monitor.udx_events WHERE event_type = 'UNMATCHED_KEY' GROUP BY key
Rows Loaded
-----
      2
(1 row)

=> SELECT key, SUM(num_instances) FROM v_monitor.UDX_EVENTS
WHERE event_type = 'UNMATCHED_KEY' GROUP BY key;
  key      | SUM
-----+-----
chain      | 1
menu.elements.calories | 7
(2 rows)

```

For other examples, see [JSON data](#).

FREGEXPARSER

Parses a regular expression, matching columns to the contents of the named regular expression groups.

This parser is for use in Flex tables only. All flex parsers store the data as a single VMap in the `LONG VARBINAR_raw__` column. If a data row is too large to fit in the column, it is rejected. Vertica supports null values for loading data with NULL -specified columns.

Syntax

```
FREGEXPARSER ( pattern=[parameter-name='value'[...]] )
```

Parameters

pattern

Specifies the regular expression of data to match.

Default: Empty string (`''`)

use_jit

Boolean, specifies whether to use just-in-time compiling when parsing the regular expression.

Default: false

record_terminator

Specifies the character used to separate input records.

Default: `\n`

logline_column

A string that captures the destination column containing the full string that the regular expression matched.

Default: Empty string (`''`)

Example

These examples use the following regular expression, which searches for information that includes the `timestamp`, `date`, `thread_name`, and `thread_id` strings.

Caution

For display purposes, this sample regular expression adds new line characters to split long lines of text. To use this expression in a query, first copy and edit the example to remove any new line characters.

This example expression loads any `thread_id` hex value, regardless of whether it has a `0x` prefix, (`<thread_id>(?:0x)?[0-9a-f]+`).

```
'(?<time>\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d)'
'(?<thread_name>[A-Za-z ]+);(?<thread_id>(?:0x)?[0-9a-f]+)'
'(?<transaction_id>[0-9a-f])?({(?<component>\w+)})'
'-(?<level>\w+)|> )?(?:-(?<elevel>\w+)|> @[(?<enode>\w+)]?:)'
'(?<text>.*)'
```

1. Create a flex table (**vlog**) to contain the results of a Vertica log file. For this example, we made a copy of a log file in the directory `/home/dbadmin/data/vertica.log` :

```
=> CREATE FLEX TABLE vlog1 ();
CREATE TABLE
```

2. Use the **fregexparser** with the sample regular expression to load data from the log file. Be sure to remove any line characters before using this expression shown here:

```
=> COPY vlog1 FROM '/home/dbadmin/tempdat/KMvertica.log'
PARSER FREGEXPARSER(pattern=
'^(?<time>\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d)'
'(?<thread_name>[A-Za-z ]+);(?<thread_id>(?:0x)?[0-9a-f]+)'
'-(?<transaction_id>[0-9a-f])?({(?<component>\w+)})'
'\<(?!<level>\w+)|> )?(?:-(?!<elevel>\w+)|> @[(?!<enode>\w+)]?:)'
'(?<text>.*)'
```

```
);
```

Rows Loaded

31049

(1 row)

3. After successfully loading data, use the **MAPTOSTRING()** function with the table's `__raw__` column. The four rows (**limit 4**) that the query returns are regular expression results of the `KMvertica.log` file, parsed with **fregexparser** . The output shows `thread_id` values with a preceding `0x` or without:

```
=> SELECT maptostring(__raw__) FROM vlog1 LIMIT 4;
      maptostring
-----
{"text": "[Init] <INFO> Log /home/dbadmin/VMart/v_vmart_node0001_catalog/vertica.log
opened; #2",
"thread_id": "0x7f2157e287c0",
"thread_name": "Main",
"time": "2017-03-21 23:30:01.704"}

{"text": "[Init] <INFO> Processing command line: /opt/vertica/bin/vertica -D
home/dbadmin/VMart/v_vmart_node0001_catalog -C VMart -n v_vmart_node0001 -h
10.20.100.247 -p 5433 -P 4803 -Y ipv4",
"thread_id": "0x7f2157e287c0",
"thread_name": "Main",
"time": "2017-03-21 23:30:01.704"}

{"text": "[Init] <INFO> Starting up Vertica Analytic Database v8.1.1-20170321",
"thread_id": "7f2157e287c0",
"thread_name": "Main",
"time": "2017-03-21 23:30:01.704"}

{"text": "[Init] <INFO> Compiler Version: 4.8.2 20140120 (Red Hat 4.8.2-15)",
"thread_id": "7f2157e287c0",
"thread_name": "Main",
"time": "2017-03-21 23:30:01.704"}

(4 rows)
```

- [FDELIMITEDPARSER](#)
- [FJSONPARSER](#)

ORC

Use the ORC clause with the [COPY](#) statement to load data in the ORC format. When loading data into Vertica, you can read all primitive types, UUIDs, and [complex types](#).

By default, the ORC parser uses strong schema matching, meaning that columns in the data must exactly match the columns in the table using the data. You can optionally use [Loose \(soft\) Schema Matching](#).

If the table definition includes columns of primitive types and those columns are not in the data, the parser fills those columns with NULL. If the table definition includes columns of complex types, those columns must be present in the data.

This parser does not support [apportioned load or cooperative parse](#).

Syntax

```
ORC ( [ parameter=value[...] ] )
```

Parameters

All parameters are optional.

hive_partition_cols

Comma-separated list of columns that are partition columns in the data.

Deprecated

Instead, use COPY PARTITION COLUMNS. See [Partitioned data](#). If you use both this parameter and PARTITION COLUMNS, COPY ignores the parameter.

allow_no_match

Whether to accept a path containing a glob with no matching files and report zero rows in query results. If this parameter is not set, Vertica returns an error if the path in the FROM clause does not match at least one file.

do_soft_schema_match_by_name

Whether to enable loose schema matching (true) instead of the strict matching based on column order in the table definition and ORC file (false, default). See [Loose Schema Matching](#) for more information.

Default: false.

reject_on_materialized_type_error

Boolean, applies only if [do_soft_schema_match_by_name](#) is true. Specifies what to do when loose schema matching is being used and a value cannot be coerced from the data to the target column type. A value of true means to reject the row; a value of false means to use NULL for the value or, for strings that are too long, truncate. See [the table of type coercions](#) for coercible type mappings.

Default: true.

Loose schema matching

By default, the ORC parser uses strong schema matching. This means that all columns in the ORC data must be loaded, and they must be loaded in the same order as in the data. However, there are times when you only want to pull certain columns, or you want to be able to accommodate future changes in the ORC schema. This is called loose (or soft) schema matching.

Use the [do_soft_schema_match_by_name](#) parameter to enable loose schema matching. This setting has the following effects:

- Columns in the data are matched to columns in the table by their names. Names must exactly match but are case-insensitive.
- Columns that exist in the ORC data but are not part of the table definition are ignored.
- Columns that exist in the table definition but not the ORC data are filled with NULL.
- If the same case-insensitive column name occurs more than once in the ORC data, the parser uses the last one. (This situation can arise when using data written by tools that are case-sensitive.)
- Column types do not need to exactly match, so long as the data type in the ORC file can be coerced to the type used by the table.

While the Parquet parser applies loose schema matching to both column and field names, the ORC parser applies it only to column names.

Data types

This parser can read all primitive types, UUIDs, and [complex types](#).

If the total size of an array exceeds the size defined by the target table, the parser rejects the row.

The following mappings are supported with type coercion and loose schema matching:

ORC Physical Type	Coercible to Vertica Data Type
BOOLEAN	BOOLEAN
BYTE, SHORT, INT, LONG	INT
FLOAT, DOUBLE	FLOAT
DECIMAL	NUMERIC
DATE	DATE
TIMESTAMP	TIMESTAMP, TIMESTAMPTZ
STRING, CHAR, VARCHAR	CHAR, VARCHAR, LONG VARCHAR
BINARY	BINARY, VARBINARY, LONG VARBINARY

Examples

The ORC clause does not use the PARSER option:

```
--> CREATE EXTERNAL TABLE orders (...)  
  AS COPY FROM 's3://DataLake/orders.orc' ORC;
```

You can read a map column as an array of rows, as in the following example:

```
--> CREATE EXTERNAL TABLE orders  
(orderkey INT,  
  custkey INT,  
  prods ARRAY[ROW(key VARCHAR(10), value DECIMAL(12,2))],  
  orderdate DATE  
  ) AS COPY FROM '...' ORC;
```

PARQUET

Use the **PARQUET** parser with the **COPY** statement to load data in the Parquet format. When loading data into Vertica you can read all primitive types, UUIDs, and [complex types](#).

By default, the Parquet parser uses strong schema matching, meaning that columns in the data must exactly match the columns in the table using the data. You can optionally use [Loose Schema Matching](#).

When loading Parquet data, Vertica caches the Parquet metadata to improve efficiency. This cache uses local TEMP storage and is not used if TEMP is remote. See the [ParquetMetadataCacheSizeMB](#) configuration parameter to change the size of the cache.

This parser does not support [apportioned load or cooperative parse](#).

Syntax

```
PARQUET ( [ parameter=value[,...] ] )
```

Parameters

All parameters are optional.

hive_partition_cols

Comma-separated list of columns that are partition columns in the data.

Deprecated

Instead, use COPY PARTITION COLUMNS. See [Partitioned data](#). If you use both this parameter and PARTITION COLUMNS, COPY ignores the parameter.

allow_no_match

Boolean. Whether to accept a path containing a glob with no matching files and report zero rows in query results. If this parameter is not set, Vertica returns an error if the path in the FROM clause does not match at least one file.

allow_long_varbinary_match_complex_type

Boolean. Whether to enable flexible column types (see [Flexible complex types](#)). If true, the Parquet parser allows a complex type in the data to match a table column defined as LONG VARBINARY. If false, the Parquet parser requires strong typing of complex types. With the parameter set you can still use strong typing. Set this parameter to false if you want use of flexible columns to be treated as an error.

do_soft_schema_match_by_name

Whether to enable loose schema matching (true) instead of the strict matching based on column order in the table definition and parquet file (false, default). See [Loose Schema Matching](#) for more information.

Default: false.

reject_on_materialized_type_error

Boolean, applies only if **do_soft_schema_match_by_name** is true. Specifies what to do when loose schema matching is being used and a value cannot be coerced from the data to the target column type. A value of true means to reject the row; a value of false means to use NULL for the value or, for strings that are too long, truncate. See [the table of type coercions](#) for coercible type mappings.

Default: true.

Loose schema matching

By default, the Parquet parser uses strong schema matching. This means that all columns and struct fields in the Parquet data must be loaded, and they must be loaded in the same order as in the data. However, there are times when you only want to pull certain columns or fields, or you want to be able to accommodate future changes in the Parquet schema. This is called loose (or soft) schema matching.

Use the [do_soft_schema_match_by_name](#) parameter to enable loose schema matching. This setting has the following effects:

- Columns or struct fields in the data are matched to columns or fields in the table by their names. Names must exactly match but are case-insensitive.
- Columns or fields that exist in the Parquet data but are not part of the table definition are ignored.
- Columns or fields that exist in the table definition but not the Parquet data are filled with NULL. The parser logs an UNMATCHED_TABLE_COLUMNS_PARQUETPARSER event in [QUERY_EVENTS](#).
- If the same case-insensitive column name occurs more than once in the Parquet data, the parser uses the last one. (This situation can arise when using data written by tools that are case-sensitive.)
- Column and field types do not need to exactly match, so long as the data type in the Parquet file can be coerced to the type used by the table. If a type cannot be coerced, the parser logs a TYPE_MISMATCH_COLUMNS_PARQUETPARSER event in QUERY_EVENTS. If [reject_on_materialized_type_error](#) is true then the parser rejects the row. If it is false, the parser uses NULL or, for string values that are too long, truncates the value.

Data types

The Parquet parser maps Parquet data types to Vertica data types as follows.

Parquet Logical Type	Vertica Data Type
StringLogicalType	VARCHAR
MapLogicalType	ARRAY[ROW]
ListLogicalType	ARRAY/SET
IntLogicalType	INT/NUMERIC
DecimalLogicalType	NUMERIC
DateLogicalType	DATE
TimeLogicalType	TIME
TimestampLogicalType	TIMESTAMP
UUIDLogicalType	UUID

If the total size of an array exceeds the size defined by the target table, the parser rejects the row.

The following logical types are not supported:

- EnumLogicalType
- IntervalLogicalType
- JSONLogicalType
- BSONLogicalType
- UnknownLogicalType

The Parquet parser supports the following mappings of physical types:

Parquet Physical Type	Vertica Data Type
BOOLEAN	BOOLEAN
INT32/INT64	INT
INT96	Supported only for TIMESTAMP

FLOAT	DOUBLE
DOUBLE	DOUBLE
BYTE_ARRAY	VARBINARY
FIXED_LEN_BYTE_ARRAY	BINARY

The following mappings are supported with type coercion and loose schema matching.

Parquet Physical Type	Coercible to Vertica Data Type
BOOLEAN	BOOLEAN
INT32, INT64, BOOLEAN	INT
FLOAT, DOUBLE	DOUBLE
INT32, INT96	DATE
INT64, INT96	TIMESTAMP, TIMESTAMPTZ
INT64 If precision > 0: INT32, BYTE_ARRAY, FIXED_LEN_BYTE_ARRAY	Numeric
BYTE_ARRAY	CHAR, VARCHAR, LONG VARCHAR, BINARY, VARBINARY, LONG VARBINARY
FIXED_LEN_BYTE_ARRAY	UUID

Vertica supports only 3-level-encoded arrays, not 2-level-encoded.

Examples

The PARQUET clause does not use the PARSER option:

```
-> COPY sales FROM 's3://DataLake/sales.parquet' PARQUET;
```

In the following example, the data directory contains no files:

```
-> CREATE EXTERNAL TABLE customers (...)
  AS COPY FROM 'webhdfs:///data/*.parquet' PARQUET;
-> SELECT COUNT(*) FROM customers;
ERROR 7869: No files match when expanding glob: [webhdfs:///data/*.parquet]
```

To read zero rows instead of producing an error, use the [allow_no_match](#) parameter:

```
-> CREATE EXTERNAL TABLE customers (...)
  AS COPY FROM 'webhdfs:///data/*.parquet'
  PARQUET(allow_no_match='true');
-> SELECT COUNT(*) FROM customers;
count
-----
0
(1 row)
```

To allow reading a complex type (menu, in this example) as a flexible column type, use the [allow_long_varbinary_match_complex_type](#) parameter:

```
-> CREATE EXTERNAL TABLE restaurants
  (name VARCHAR, cuisine VARCHAR, location_city ARRAY[VARCHAR], menu LONG VARBINARY)
  AS COPY FROM 'data/rest*.parquet'
  PARQUET(allow_long_varbinary_match_complex_type='True');
```

To read only some columns from the restaurant data, use loose schema matching:

```
-> CREATE EXTERNAL TABLE restaurants(name VARCHAR, cuisine VARCHAR)
  AS COPY FROM 'data/rest'.parquet
  PARQUET(allow_long_varbinary_match_complex_type='True',
         do_soft_schema_match_by_name='True');

-> SELECT * from restaurant;
   name      | cuisine
-----+-----
Bob's pizzeria | Italian
Bakersfield Tacos | Mexican
(2 rows)
```

Examples

For additional COPY examples, see the reference pages for specific parsers, including: [DELIMITED](#), [ORC](#), [PARQUET](#), [FJSONPARSER](#), and [FAVROPARSER](#).

Specifying string options

Use COPY with FORMAT, DELIMITER, NULL, and ENCLOSED BY options:

```
-> COPY public.customer_dimension (customer_since FORMAT 'YYYY')
  FROM STDIN
  DELIMITER ','
  NULL AS 'null'
  ENCLOSED BY '';
```

This example sets and references a `vsq|` variable for the input file:

```
-> \set input_file ../myCopyFromLocal/large_table.gzip
-> COPY store.store_dimension
  FROM :input_file
  DELIMITER '|'
  NULL ""
  RECORD TERMINATOR E'\n';
```

Including multiple source files

Create a table and then copy multiple source files to it:

```
-> CREATE TABLE sampletab (a int);
CREATE TABLE
-----
-> COPY sampletab FROM 'home/dbadmin/one.dat', 'home/dbadmin/two.dat';
Rows Loaded
-----
      2
(1 row)
```

Use wildcards to indicate a group of files:

```
-> COPY myTable FROM 'webhdfs:///mydirectory/ofmanyfiles/*.dat';
```

Wildcards can include regular expressions:

```
-> COPY myTable FROM 'webhdfs:///mydirectory/*_[0-9]';
```

Specify multiple paths in a single COPY statement:

```
-> COPY myTable FROM 'webhdfs:///data/sales/01/*.dat', 'webhdfs:///data/sales/02/*.dat',
  'webhdfs:///data/sales/historical.dat';
```

Distributing a load

Load data that is shared across all nodes. Vertica distributes the load across all nodes, if possible:

```
-> COPY sampletab FROM '/data/file.dat' ON ANY NODE;
```

Load data from two files. Because the first load file does not specify nodes (or ON ANY NODE), the initiator performs the load. Loading the second file is distributed across all nodes:

```
=> COPY sampletab FROM '/data/file1.dat', '/data/file2.dat' ON ANY NODE;
```

Specify different nodes for each load file:

```
-> COPY sampletab FROM '/data/file1.dat' ON (v_vmart_node0001, v_vmart_node0002),  
    '/data/file2.dat' ON (v_vmart_node0003, v_vmart_node0004);
```

Loading data from shared storage

To load data from shared storage, use URLs in the corresponding schemes:

- [HDFS](#): `[[s]web]hdfs://[nameservice]/ path`
- [S3](#): `s3:// bucket / path`
- [Google Cloud](#): `gs:// bucket / path`
- [Azure](#): `azb:// account / container / path`

Note

Loads from HDFS, S3, GCS, and Azure default to **ON ANY NODE** ; you do not need to specify it.

Load a file stored in HDFS using the default name node or name service:

```
-> COPY t FROM 'webhdfs://opt/data/file1.dat';
```

Load data from a particular HDFS name service (testNS). You specify a name service if your database is configured to read from more than one HDFS cluster:

```
-> COPY t FROM 'webhdfs://testNS/opt/data/file2.csv';
```

Load data from an S3 bucket:

```
-> COPY t FROM 's3://AWS_DataLake/' ORC;
```

Partitioned data

Data files can be partitioned using the directory structure, such as:

```
path/created=2016-11-01/region=northeast/*  
path/created=2016-11-01/region=central/*  
path/created=2016-11-01/region=southeast/*  
path/created=2016-11-01/...  
path/created=2016-11-02/region=northeast/*  
path/created=2016-11-02/region=central/*  
path/created=2016-11-02/region=southeast/*  
path/created=2016-11-02/...  
path/created=2016-11-03/...  
path/...
```

Load partition columns using the PARTITION COLUMNS option:

```
-> CREATE EXTERNAL TABLE records (id int, name varchar(50), created date, region varchar(50))  
    AS COPY FROM 'webhdfs://path/'/*  
    PARTITION COLUMNS created, region;
```

Using filler columns

In the following example, the table has columns for first name, last name, and full name, but the data being loaded contains columns for first, middle, and last names. The COPY statement reads all of the source data but only loads the source columns for first and last names. It constructs the data for the full name by concatenating each of the source data columns, including the middle name. The middle name is read as a FILLER column so it can be used in the concatenation, but is ignored otherwise. (There is no table column for middle name.)

```

=> CREATE TABLE names(first VARCHAR(20), last VARCHAR(20), full VARCHAR(60));
CREATE TABLE
=> COPY names(first,
              middle FILLER VARCHAR(20),
              last,
              full AS first||' '||middle||' '||last)
FROM STDIN;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> Marc|Gregory|Smith
>> Sue|Lucia|Temp
>> Jon|Pete|Hamilton
>> \.
=> SELECT * from names;
first | last | full
-----+-----+-----
Jon | Hamilton | Jon Pete Hamilton
Marc | Smith | Marc Gregory Smith
Sue | Temp | Sue Lucia Temp
(3 rows)

```

In the following example, JSON data contains an unencrypted password. The JSON data and the table definition use the same name for the field. Instead of loading the value directly, the COPY statement uses a filler column and a (hypothetical) function to encrypt the value. Both the table column (`users.password`) and the filler column (`**FILLER**.password`) are fully qualified:

```

=> CREATE TABLE users(user VARCHAR(32), password VARCHAR(32));
=> COPY users(user, password FILLER VARCHAR(32),
            users.password AS encrypt("**FILLER".password))
FROM ... PARSE FJSONPARSER();

```

Setting defaults for null values

When creating a table, you can specify a default value for a column. When loading data, Vertica uses the default if the column value is not present. However, defaults do not override null values.

To intercept null values and apply defaults, you can first stage the load with COPY NO COMMIT and then update the values:

```

=> CREATE TABLE sales (id INT, shipped TIMESTAMP(6) DEFAULT now());
=> COPY sales FROM ... NO COMMIT;
=> UPDATE sales SET shipped = DEFAULT WHERE epoch IS NULL;
=> COMMIT;

```

All Vertica tables have an implicit `epoch` column, which records when the data was committed. For data that is not yet committed, this value is null. You can use this column to identify the just-loaded data and update it before committing.

Loading data into a flex table

Create a Flex table and copy JSON data into it:

```

=> CREATE FLEX TABLE darkdata();
CREATE TABLE
=> COPY tweets FROM 'myTest/Flexible/DATA/tweets_12.json' PARSE FJSONPARSER();
Rows Loaded
-----
12
(1 row)

```

Using named pipes

COPY supports named pipes that follow the same naming conventions as file names on the given file system. Permissions are `open` , `write` , and `close` .

Create a named pipe and set two `vsq` variables:

```
=> \! mkfifo pipe1
=> \set dir 'pwd' /
=> \set file ""'.dirpipe1'"
```

Copy an uncompressed file from the named pipe:

```
=> \! cat pf1.dat > pipe1 &
=> COPY large_tbl FROM :file delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
```

Loading compressed data

Copy a GZIP file from a named pipe and uncompress it:

```
=> \! gzip pf1.dat
=> \! cat pf1.dat.gz > pipe1 &
=> COPY large_tbl FROM :file ON site01 GZIP delimiter '|';
=> SELECT * FROM large_tbl;
=> COMMIT;
=> \!gunzip pf1.dat.gz
```

COPY FROM VERTICA

Imports data from another Vertica database. COPY FROM VERTICA is similar to [COPY](#), but supports only a subset of its parameters.

Important

The source database must be no more than one major release behind the target database.

Syntax

```
COPY [{namespace. | database.}]schema.]target-table
  [( target-columns )]
FROM VERTICA {source-namespace. | source-database.}[source-schema.]source-table
  [( source-columns )]
[STREAM NAME 'stream name']
[NO COMMIT]
```

Parameters

{ *namespace*. | *database*. }

Name of the database or [namespace](#) that contains *table*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be [default_namespace](#).
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#). If you specify the namespace or database name, you must provide the schema name, even if the schema is [public](#).

target-table

The target table for the imported data. Vertica loads the data into all projections that include columns from the schema table.

target-columns

A comma-delimited list of columns in *target-table* to store the copied data. See [Mapping Between Target and Source Columns](#) below.

You cannot use FILLER columns or columns of [complex types](#), except native arrays, as part of the column definition.

{ *source-database*. | [*source-namespace*.] }

The source of the data to import, which depends on the mode of your database:

- Eon Mode: specify the namespace in the source database that contains the data to import, by default [default_namespace](#).
- Enterprise Mode: specify the source database name.

A connection to the source database must already exist in the current session before starting the copy operation; otherwise Vertica returns an error. For details, see [CONNECT TO VERTICA](#).

[*source-schema*.] *source-table*

The table that is the source of the imported data. If *schema* is any schema other than [public](#) or if you specified a *source-namespace*, you must

supply the schema name.

source-columns

A comma-delimited list of the columns in the source table to import. If omitted, all columns are exported. Columns cannot be of complex types. See [Mapping Between Target and Source Columns](#) below.

STREAM NAME

A COPY load stream identifier. Using a stream name helps to quickly identify a particular load. The STREAM NAME value that you specify in the load statement appears in the **stream** column of the [LOAD_STREAMS](#) system table.

NO COMMIT

Prevents COPY from committing its transaction automatically when it finishes copying data. For details, see [Using transactions to stage a load](#).

Privileges

- Source table: SELECT
- Source table schema: USAGE
- Target table: INSERT
- Target table schema: USAGE

Mapping between target and source columns

If you copy all table data from one database to another, COPY FROM VERTICA can omit specifying column lists if column definitions in both tables comply with the following conditions:

- Same number of columns
- Identical column names
- Same sequence of columns
- Matching or [compatible](#) column data types
- No complex data types (ARRAY, SET, or ROW), except for native arrays

If any of these conditions is not true, the COPY FROM VERTICA statement must include column lists that explicitly map target and source columns to each other, as follows:

- Contain the same number of columns.
- List source and target columns in the same order.
- Pair columns with the same (or [compatible](#)) data types.

Node failure during COPY

See [Handling node failure during copy/export](#).

Examples

The following example copies the contents of an entire table from the **vmart** database to an identically-defined table in the current database:

```
=> CONNECT TO VERTICA vmart USER dbadmin PASSWORD 'myPassword' ON 'VertTest01',5433;
CONNECT
=> COPY customer_dimension FROM VERTICA vmart.customer_dimension;
Rows Loaded
-----
 500000
(1 row)
=> DISCONNECT vmart;
DISCONNECT
```

For more examples, see [Copying data from another Vertica database](#).

See also

[EXPORT TO VERTICA](#)

COPY LOCAL

Using the COPY statement with its LOCAL option lets you load data files (up to 4,294,967,295 files) on a client system, rather than on a cluster host. COPY LOCAL supports the STDIN and **'pathToData'** parameters, but not the [ON *nodename*] clause. COPY LOCAL does not support multiple file batches in NATIVE or NATIVE VARCHAR formats. COPY LOCAL does not support reading ORC or Parquet files; use ON NODE instead. COPY LOCAL does not support CURRENT_LOAD_SOURCE().

The COPY LOCAL option is platform-independent. The statement works in the same way across all supported Vertica platforms and drivers. For more details about supported drivers, see [Client drivers](#).

COPY LOCAL does not automatically create files detailing exceptions and rejections, even if exceptions occur.

COPY LOCAL is subject to the following restrictions when used with vsql and the [client libraries](#):

- COPY LOCAL must be the first statement in any multi-statement query.
- COPY LOCAL cannot be used multiple times in the same query.

Note

On Windows clients, the path you supply for the COPY LOCAL file is limited to 216 characters due to limitations in the Windows API.

Privileges

User must have INSERT privilege on the table and USAGE privilege on the schema.

How COPY LOCAL works

COPY LOCAL loads data in a platform-neutral way. The COPY LOCAL statement loads all files from a local client system to the Vertica host, where the server processes the files. You can copy files in various formats: uncompressed, compressed, fixed-width format, in bzip or gzip format, or specified as a bash glob. Files of a single format (such as all bzip, or gzip) can be comma-separated in the list of input files. You can also use any of the applicable COPY statement options (as long as the data format supports the option). For instance, you can define a specific delimiter character, or how to handle NULLs, and so forth.

Note

The Linux `glob` command returns files that match the pattern you enter, as specified in the [Linux Manual Page for Glob \(7\)](#). For ADO.net platforms, specify patterns and wildcards as described in the .NET [Directory.GetFiles Method](#).

For more information about using the COPY LOCAL option to load data, see [COPY](#) for syntactical descriptions, and [Specifying where to load data from](#) for detailed examples.

The Vertica host uncompresses and processes the files as necessary, regardless of file format or the client platform from which you load the files. Once the server has the copied files, Vertica maintains performance by distributing file parsing tasks, such as encoding, compressing, uncompressing, across nodes.

Viewing copy local operations in a query plan

When you use the COPY LOCAL option, the GraphViz query plan includes a label for `Load-Client-File`, rather than `Load-File`. Following is a section from a sample query plan:

```
-----
PLAN: BASE BULKLOAD PLAN (GraphViz Format)
-----
digraph G {
graph [rankdir=BT, label = " BASE BULKLOAD PLAN \nAll Nodes Vector:
\n\n node[0]=initiator (initiator) Up\n", labelloc=t, labeljust=l ordering=out]
.
.
.
10[label = "Load-Client-File(/tmp/diff) \nOutBlk=[UncTuple]",
color = "green", shape = "ellipse"];
```

Examples

The following example shows a load from a local file.

```

$ cat > t.dat
12
17
9
^C

=> CREATE TABLE numbers (value INT);
CREATE TABLE

=> COPY numbers FROM LOCAL 't.dat';
Rows Loaded
-----
      3
(1 row)

=> SELECT * FROM numbers;
value
-----
  12
  17
   9
(3 rows)

```

CREATE statements

CREATE statements let you create new database objects such as tables and users.

CREATE ACCESS POLICY

Creates an [access policy](#) that filters access to table data to users and roles. You can create access policies for table rows and columns. Vertica applies the access policy filters with each query and returns only the data that is permissible for the current user or role.

You cannot set access policies on columns of complex data types other than native arrays. If the table contains complex-type columns, you can still set row access policies and column access policies on other columns.

Syntax

```
CREATE ACCESS POLICY ON [[database.]schema.]table
  { FOR COLUMN column | FOR ROWS WHERE } expression [GRANT TRUSTED] { ENABLE | DISABLE }
```

Parameters

[*database.*] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

table

The table with the target column or rows.

FOR COLUMN *column*

The column on which to apply this access policy. The column can be a native array, but other complex types are not supported. (See [Complex types](#).)

FOR ROWS WHERE

The rows on which to apply this access policy.

expression

A SQL expression that specifies conditions for accessing row or column data:

- Row access policies limit access to specific rows in a table, as specified by the policy's WHERE expression. Only rows that satisfy this expression are fetched from the table. For details and sample usage, see [Creating row access policies](#).
- Column access policies limit access to specific table columns. The access policy expression can also specify how to render column data to specific users and roles. For details and sample usage, see [Creating column access policies](#).

GRANT TRUSTED

Specifies that GRANT statements take precedence over the access policy in determining whether users can perform DML operations on the target table. If omitted, users can only modify table data if the access policy allows them to see the stored data in its original, unaltered state. For more information, see [Access policies and DML operations](#).

Important

GRANT TRUSTED only affects DML operations and does not enable users to see data that the access policy would otherwise mask. Specifying this option may allow users with certain grants to update data that they cannot see.

ENABLE | DISABLE

Whether to enable the access policy. You can enable and disable existing access policies with [ALTER ACCESS POLICY](#).

Privileges

Non-superuser: Ownership of the table

Restrictions

The following limitations apply to access policies:

- A column can have only one access policy.
- Column access policies cannot be set on columns of complex types other than native arrays.
- Column access policies cannot be set for materialized columns on flex tables. While it is possible to set an access policy for the `__raw__` column, doing so restricts access to the whole table.

- Row access policies are invalid on temporary tables and tables with aggregate projections.
- Access policy expressions cannot contain:
 - Subqueries
 - Aggregate functions
 - Analytic functions
 - User-defined transform functions (UDTF)
- If the query optimizer cannot replace a deterministic expression that involves only constants with their computed values, it blocks all DML operations such as INSERT .

See also

- [Access policies](#)
- [ALTER ACCESS POLICY](#)
- [DROP ACCESS POLICY](#)

CREATE AUTHENTICATION

Creates and enables an authentication record associated with users or roles. Authentication records are automatically enabled after creation.

Syntax

```
CREATE AUTHENTICATION auth-record-name
  METHOD 'auth-method'
  access-method
  [ FALLTHROUGH ]
```

Parameters

Name	Description
<i>auth-record-name</i>	Name of the authentication record, where <i>auth-record-name</i> conforms to conventions described in Identifiers .
<i>auth-method</i>	<p>The authentication method, one of the following:</p> <ul style="list-style-type: none"> • trust : Users can authenticate with a valid username (that is, without a password). • reject : Rejects the connection attempt. • hash : Users must provide a valid username and password. For details, see Hash authentication. • gss : Authorizes clients that connect to Vertica with an MIT Kerberos implementation. The Key Distribution Center (KDC) must support Kerberos 5 using the GSS-API. Non-MIT Kerberos implementations must use the GSS-API. For details, see Kerberos authentication. • ident : Authenticates the client against a username on an Ident server. For details, see Ident authentication. • ldap : Authenticates a client and their username and password with an LDAP or Active Directory server. For details, see LDAP authentication. • tls : Authenticates clients that provide a certificate with a Common Name (CN) that specifies a valid database username. Vertica must be configured for mutual mode TLS to use this method. For details, see TLS authentication • oauth : Authenticates a client with an access token. For details, see OAuth 2.0 authentication. <p>For details, see Supported Client Authentication Methods.</p>
<i>access-method</i>	<p>The access method the client uses to connect, specified in one of the following ways:</p> <ul style="list-style-type: none"> • LOCAL : Matches connection attempts made using local domain sockets. • HOST [TLS NO TLS] 'host-ip-address' : Matches connection attempts made using TCP/IP, where <i>host-ip-address</i> can be an IPv4 or IPv6 address. You can qualify HOST with one of the following options: <ul style="list-style-type: none"> ◦ TLS (default): Match an SSL/TLS-wrapped TCP socket. ◦ NO TLS : Match a plain (non-SSL/TLS) socket only.

[
FALLTHROUGH
]

Whether to enable [fallthrough authentication](#) for this record. To disable fallthrough, see [ALTER AUTHENTICATION](#).

Fallthrough cannot be enabled for authentication records that use the following authentication methods:

- [gss](#)
- [oauth](#)
- [reject](#)
- [trust](#)

Privileges

DBADMIN

Examples

See [Creating authentication records](#).

See also

- [ALTER AUTHENTICATION](#)
- [DROP AUTHENTICATION](#)
- [GRANT \(authentication\)](#)
- [REVOKE \(authentication\)](#)

CREATE CA BUNDLE

Deprecated

CA bundles are only usable with certain deprecated parameters in [Kafka notifiers](#). You should prefer using [TLS configurations](#) and the TLS CONFIGURATION parameter for notifiers instead.

Creates a certificate authority (CA) bundle. These contain root CA certificates.

Syntax

```
CREATE CA BUNDLE name [CERTIFICATES ca_cert[, ca_cert[, ...]]
```

Parameters

name

The name of the CA bundle.

ca_cert

The name of the CA certificate. If no certificates are specified, the bundle will be empty.

Privileges

Ownership of the CA certificates in the CA bundle.

Examples

See [Managing CA bundles](#).

See also

- [ALTER CA BUNDLE](#)
- [DROP CA BUNDLE](#)

CREATE CERTIFICATE

Creates or imports a certificate, Certificate Authority (CA), or intermediate CA. These certificates can be used with [ALTER TLS CONFIGURATION](#) to set up [client-server TLS](#), [LDAPLink TLS](#), [LDAPAuth TLS](#), and [internode TLS](#).

CREATE CERTIFICATE generates x509v3 certificates.

Syntax

```
CREATE [TEMP[ORARY]] [CA] CERTIFICATE certificate_name
  {AS cert [KEY key_name]
  | SUBJECT subject
  [ SIGNED BY ca_cert ]
  [ VALID FOR days ]
  [ EXTENSIONS ext = val[,...] ]
  [ KEY private_key ]}
```

Parameters

TEMPORARY

Create with session scope. The key is stored in memory and is valid only for the current session.

CA

Designates the certificate as a CA or intermediate certificate. If omitted, the operation creates a normal certificate.

certificate_name

The name of the certificate.

AS *cert*

The imported certificate (string).

This parameter should include the entire chain of certificates, excluding the CA certificate.

KEY *key_name*

The name of the key.

This parameter only needs to be set for client/server certificates and CA certificates that you intend to sign other certificates with in Vertica. If your imported CA certificate will only be used for validating other certificates, you do not need to specify a key.

SUBJECT *subject*

The entity to issue the certificate to (string).

SIGNED BY *ca_cert*

The name of the CA that signed the certificate.

When adding a CA certificate, this parameter is optional. Specifying it will create an intermediate CA that cannot be used to sign other CA certificates.

When creating a certificate, this parameter is required.

VALID FOR *days*

The number of days that the certificate is valid.

EXTENSIONS *ext = val*

Strings specifying certificate extensions. For a full list of extensions, see the [OpenSSL documentation](#).

KEY *private_key*

The name of the certificate's private key.

When importing a certificate, this parameter is required.

Privileges

Superuser

Default extensions

CREATE CERTIFICATE generates x509v3 certificates and includes several extensions by default. These differ based on the type of certificate you create:

CA Certificate:

- 'basicConstraints' = 'critical, CA:true'
- 'keyUsage' = 'critical, digitalSignature, keyCertSign'
- 'nsComment' = Vertica generated [CA] certificate'
- 'subjectKeyIdentifier' = 'hash'

Certificate:

- 'basicConstraints' = 'CA:false'
- 'keyUsage' = 'critical, digitalSignature, keyEncipherment'

Examples

See [Generating TLS certificates and keys](#) .

See also

- [CREATE KEY](#)

CREATE DATA LOADER

CREATE DATA LOADER creates an automatic data loader that executes a [COPY](#) statement when new data files appear in a specified path. The loader records which files have already been successfully loaded and skips them. These events are recorded in the [DATA_LOADER_EVENTS](#) system table.

You can execute a data loader in the following ways:

- On demand: Use [EXECUTE DATA LOADER](#) to execute the data loader once.
- On a schedule: Use a [scheduled stored procedure](#) .
- In response to a notification (AWS SQS only): Define a [trigger](#) on the data loader.

Executing the loader automatically commits the transaction.

The [DATA_LOADERS](#) system table shows all defined loaders. The [DATA_LOADER_EVENTS](#) system table records paths that were attempted and their outcomes. To prevent unbounded growth, records in DATA_LOADER_EVENTS are purged after a specified retention interval. If previously-loaded files are still in the source path after this purge, the data loader sees them as new files and loads them again.

Syntax

```
CREATE [ OR REPLACE ] DATA LOADER [ IF NOT EXISTS ]
  [ schema.name
  [ RETRY LIMIT { NONE | DEFAULT | limit } ]
  [ RETENTION INTERVAL monitoring-retention ]
  [ TRIGGERED BY integration-json ]
  AS copy-statement
```

Arguments

OR REPLACE

If a data loader with the same name in the same schema exists, replace it. The original data loader's monitoring table is dropped.

This option cannot be used with [IF NOT EXISTS](#) .

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The [IF NOT EXISTS](#) clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

This option cannot be used with [OR REPLACE](#) .

schema

Schema containing the data loader. The default schema is [public](#) .

name

Name of the data loader.

RETRY LIMIT { NONE | DEFAULT | *limit* }

Maximum number of times to retry a failing file. Each time the data loader is executed, it attempts to load all files that have not yet been successfully loaded, up to this per-file limit. If set to DEFAULT, at load time the loader uses the value of the [DataLoaderDefaultRetryLimit](#) configuration parameter.

Default: [DEFAULT](#)

RETENTION INTERVAL *monitoring-retention*

How long to keep records in the events table. [DATA_LOADER_EVENTS](#) records events for all data loaders, but each data loader has its own retention interval.

Default: [14 days](#)

TRIGGERED BY *integration-json*

Information about an external input for the data loader, a JSON object with the following keys:

- **provider** : name of the provider; the only supported value is "AWS-SQS"
- **resourceUrl** : endpoint for the integration

If a data loader has a trigger, the loader is initially disabled. When you are ready to use it, use [ALTER DATA LOADER](#) with the ENABLE option. When the loader is enabled, Vertica executes it automatically when the trigger produces notifications for new files. For details, see [Triggers](#).

AS copy-statement

The COPY statement that the loader executes. The FROM clause typically uses a glob.

Privileges

Non-superuser: CREATE privileges on the schema.

Restrictions

- COPY NO COMMIT is not supported.
- Data loaders are executed with COPY ABORT ON ERROR.
- The COPY statement must specify file paths. You cannot use COPY FROM VERTICA.

Triggers (AWS SQS only)

If the data to be loaded is stored on AWS and you have configured an [SQS queue](#), then instead of executing a data loader explicitly using [EXECUTE DATA LOADER](#), you can define the loader to respond to S3 events. When files are added to the AWS bucket, a service running on AWS adds a message to the SQS queue. Vertica reads from this queue, executes the data loader, and, if the load was successful, removes the message from the queue. After the initial setup, this process is automatic.

To configure the data loader with a trigger, use the TRIGGERED BY option with a JSON object following this template:

```
{
  "provider" : "AWS-SQS",
  "resourceUrl" : "https://sqs.region.amazonaws.com/account_number/queue_name"
}
```

Use the following [SQS parameters](#) to authenticate to SQS:

- **SQSAuth**, to set an ID and key for all queue access.
- **SQSQueueCredentials**, to set per-queue access. Queue-specific values take precedence over **SQSAuth**.

A data loader with a trigger is initially disabled. Use [ALTER DATA LOADER](#) with the ENABLE option when you are ready to begin processing events. To pause execution, call ALTER DATA LOADER with the DISABLE option.

If a data loader has a trigger, you must disable it before dropping it.

File systems

The source path can be any shared file system or object store that all database nodes can access. To use an HDFS or Linux file system safely, you must prevent the loader from reading a partially-written file. One way to achieve this is to only execute the loader when files are not being written to the loader's path. Another way to achieve this is to write new files in a temporary location and move them to the loader's path only when they are complete.

Examples

```
-> CREATE DATA LOADER s.dl1 RETRY LIMIT NONE
  AS COPY s.local FROM 's3://b/data/*.dat';

=> SELECT name, schemaname, copystmt, retrylimit FROM data_loaders;
name | schemaname |          copystmt          | retrylimit
-----|-----|-----|-----
dl1 | s          | COPY s.local FROM 's3://b/data/*.dat' |          -1
(1 row)
```

See [Automatic load](#) for an extended example.

See also

- [EXECUTE DATA LOADER](#)
- [ALTER DATA LOADER](#)
- [DROP DATA LOADER](#)

Saves an association between an input query and a query that is annotated with optimizer hints.

CREATE DIRECTED QUERY has two variants:

- [CREATE DIRECTED QUERY OPTIMIZER](#) directs the query optimizer to generate annotated SQL from the specified input query. The annotated query contains hints that the optimizer can use to recreate its current query plan for that input query.
- [CREATE DIRECTED QUERY CUSTOM](#) specifies an annotated query supplied by the user. Vertica associates the annotated query with the input query specified by the last [SAVE QUERY](#) statement.

In both cases, Vertica associates the annotated query and input query, and registers their association in the system table [DIRECTED_QUERIES](#) under `query_name`.

Syntax

Optimizer-generated

```
CREATE DIRECTED QUERY OPT[IMIZER] query-name [COMMENT 'comments'] input-query
```

User-defined (custom)

```
CREATE DIRECTED QUERY CUSTOM query-name [COMMENT 'comments'] annotated-query
```

Parameters

OPT[IMIZER]

Directs the query optimizer to generate an annotated query from *input-query*, and associate both in the new directed query.

CUSTOM

Specifies to associate *annotated-query* with the query previously specified by [SAVE QUERY](#).

query - name

A unique identifier for the directed query, a string that conforms to conventions described in [Identifiers](#).

COMMENT '*comments*'

Comment about the directed query, up to 128 characters. Comments can be useful for future reference—for example, to explain why a given directed query was created.

If you omit this argument, Vertica inserts one of the following comments:

- Optimizer-generated directed query
- Custom directed query

input-query

The input query to associate with an optimizer-generated directed query. The input query supports only one optimizer hint, `.v` (alias IGNORECONST).

annotated-query

A query with embedded optimizer hints to associate with the input query most recently saved with [SAVE QUERY](#).

Privileges

[Superuser](#)

See also

[Creating directed queries](#)

CREATE EXTERNAL TABLE AS COPY

CREATE EXTERNAL TABLE AS COPY creates a table definition for data external to your Vertica database. This statement is a combination of the [CREATE TABLE](#) and [COPY](#) statements, supporting a subset of each statement's parameters.

Canceling a CREATE EXTERNAL TABLE AS COPY statement can cause unpredictable results. If you need to make a change, allow the statement to complete, drop the table, and then retry.

You can use [ALTER TABLE](#) to change the data types of columns instead of dropping and recreating the table.

You can use CREATE EXTERNAL TABLE AS COPY with any types except types from the Place package.

Vertica also supports external tables backed by Iceberg data. See [CREATE EXTERNAL TABLE ICEBERG](#).

Note

Vertica does not create superprojections for external tables, since external tables are not stored in the database.

Syntax

```
CREATE EXTERNAL TABLE [ IF NOT EXISTS ] [{{namespace. | database. }}schema.]table-name
  ( column-definition[...] )
[INCLUDE | EXCLUDE] [SCHEMA] PRIVILEGES
AS COPY
  [ ( { column-as-expression | column }
    [ DELIMITER [ AS ] 'char' ]
    [ ENCLOSED [ BY ] 'char' ]
    [ ENFORCELENGTH ]
    [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
    [ FILLER datatype ]
    [ FORMAT 'format' ]
    [ NULL [ AS ] 'string' ]
    [ TRIM 'byte' ]
  [...]) ]
[ COLUMN OPTION ( column
  [ DELIMITER [ AS ] 'char' ]
  [ ENCLOSED [ BY ] 'char' ]
  [ ENFORCELENGTH ]
  [ ESCAPE [ AS ] 'char' | NO ESCAPE ]
  [ FORMAT 'format' ]
  [ NULL [ AS ] 'string' ]
  [ TRIM 'byte' ]
  [...]) ]
FROM {
  { 'path-to-data'
    [ ON { nodename | (nodeset) | ANY NODE | EACH NODE } ] [ compression ] } [... ]
    [ PARTITION COLUMNS column[...] ]
  | LOCAL 'path-to-data' [ compression ] [... ]
  | VERTICA {source-namespace. | source-database. }[source-schema.]source-table(source-column[...] )
  }
  [ NATIVE
    | FIXEDWIDTH COLSIZES {{ integer }[...]}
    | NATIVE VARCHAR
    | ORC
    | PARQUET
  ]
  [ ABORT ON ERROR ]
  [ DELIMITER [ AS ] 'char' ]
  [ ENCLOSED [ BY ] 'char' ]
  [ ENFORCELENGTH ]
  [ ERROR TOLERANCE ]
  [ ESCAPE AS 'char' | NO ESCAPE ]
  [ EXCEPTIONS 'path' [ ON nodename ] [... ] ]
  [ [ WITH ] FILTER filter ( [ arg=value[...] ] ) ]
  [ NULL [ AS ] 'string' ]
  [ [ WITH ] PARSER parser [ arg=value [...] ] ]
  [ RECORD TERMINATOR 'string' ]
  [ REJECTED DATA 'path' [ ON nodename ] [... ] ]
  [ REJECTMAX integer ]
  [ SKIP integer ]
  [ SKIP BYTES integer ]
  [ TRAILING NULLCOLS ]
  [ TRIM 'byte' ]
```

Parameters

For all supported parameters, see the [CREATE TABLE](#) and [COPY](#) statements. For information on using this statement with UDLs, see [User-defined load \(UDL\)](#).

For additional guidance on using COPY parameters, see [Specifying where to load data from](#).

Privileges

Superuser, or non-superuser with the following privileges:

- READ privileges on the USER-accessible storage location. See [GRANT \(storage location\)](#)
- Full access (including SELECT) to an external table that the user has privileges to create

Partitioned data

Data can be partitioned using its directory structure and Vertica can take advantage of that partitioning to improve query performance for external tables. For details, see [Partitioned data](#).

If you see unexpected results when reading data, verify that globs in your file paths correctly align with the partition structure. See [Troubleshooting external tables](#).

ORC and Parquet data

When using the ORC and Parquet formats, Vertica supports some additional options in the COPY statement and data structures for columns. See [ORC](#) and [PARQUET](#).

Examples

The following example defines an external table for delimited data stored in HDFS:

```
=> CREATE EXTERNAL TABLE sales (itemID INT, date DATE, price FLOAT)
  AS COPY FROM 'hdfs:///data/ext1.csv' DELIMITER ',';
```

The following example uses data in the [ORC](#) format that is stored in S3. The data has two partition columns. For more information about partitions, see [Partitioned data](#).

```
=> CREATE EXTERNAL TABLE records (id int, name varchar(50), created date, region varchar(50))
  AS COPY FROM 's3://datalake/sales/*/*/*'
  PARTITION COLUMNS created, region;
```

The following example shows how you can read from all [Parquet](#) files in a local directory, with no partitions and no globs:

```
=> CREATE EXTERNAL TABLE sales (itemID INT, date DATE, price FLOAT)
  AS COPY FROM '/data/sales/*.parquet' PARQUET;
```

The following example creates an external table for data containing arrays:

```
=> CREATE EXTERNAL TABLE cust (cust_custkey int,
  cust_custname varchar(50),
  cust_custstaddress ARRAY[varchar(100)],
  cust_custaddressln2 ARRAY[varchar(100)],
  cust_custcity ARRAY[varchar(50)],
  cust_custstate ARRAY[char(2)],
  cust_custzip ARRAY[int],
  cust_email varchar(50), cust_phone varchar(30))
  AS COPY FROM 'webhdfs://data/*.parquet' PARQUET;
```

To allow users without superuser access to use external tables with data on the local file system, S3, or GCS, create a location for 'user' usage and grant access to it. This example shows granting access to a user named Bob to any external table whose data is located under /tmp (including in subdirectories to any depth):

```
=> CREATE LOCATION '/tmp' ALL NODES USAGE 'user';
=> GRANT ALL ON LOCATION '/tmp' to Bob;
```

The following example shows CREATE EXTERNAL TABLE using a user-defined source:

```
=> CREATE SOURCE curl AS LANGUAGE 'C++' NAME 'CurlSourceFactory' LIBRARY curllib;
=> CREATE EXTERNAL TABLE curl_table1 as COPY SOURCE CurlSourceFactory;
```

See also

[Creating external tables](#)

CREATE EXTERNAL TABLE ICEBERG

Creates an external table for data stored by [Apache Iceberg](#). An Iceberg table consists of data files and metadata describing the schema. Unlike other external tables, an Iceberg external table need not specify column definitions (DDL). The information is read from Iceberg metadata at query time. For certain data types you can adjust column definitions, for example to specify VARCHAR sizes.

A single Iceberg table can have more than one metadata file, each describing a different version of the table. You can create an external table using either the base location of the table or a specific metadata file.

If a metadata file specifies columns or struct fields that are not present in the data, Vertica treats the missing values as NULL.

All Iceberg files, both data and metadata, must be accessible to all database nodes.

Iceberg can store data in several file formats. Vertica can read Iceberg data in the Parquet format only and with either [version 1 or version 2 metadata](#). If the Parquet files encode field IDs, Vertica uses them directly. Otherwise, Vertica uses Iceberg fallback name mapping to read field IDs from the metadata (the [schema.name-mapping.default](#) property). If the metadata does not contain a mapping for a field, Vertica sets the column values to NULL.

Syntax

```
CREATE EXTERNAL TABLE [{namespace. | database. }]schema.table
  STORED BY ICEBERG LOCATION { path | metadata-file }
  [COLUMN TYPES (column-name type[,...])];
```

Arguments

{ namespace. | database. }

Name of the database or [namespace](#) that contains *table*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be [default_namespace](#).
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#). If you specify the namespace or database name, you must provide the schema name, even if the schema is [public](#).

table

Name of the table to create, which must be unique among names of all sequences, tables, projections, views, and models within the schema.

STORED BY ICEBERG LOCATION { path | metadata-file }

Location of Iceberg data, one of:

- Base location of an Iceberg [File System table](#). Vertica uses the latest metadata file.
- Path to a metadata file with a name ending in [.metadata.json](#). Vertica uses this metadata file even if it is not the latest.

On S3, an Iceberg table is not a File System table but a metastore. This means you cannot specify a base location on S3. You must specify the full path to a metadata file.

If the paths embedded in the Iceberg data are not accessible to Vertica, use the [IcebergPathMapping](#) configuration parameter to provide mappings. See [Path Prefixes](#).

COLUMN TYPES (column-name type [,...])

Column names and types for VARCHAR, VARBINARY, or ARRAY columns or ROW fields only. You can specify types only to set lengths or array bounds, not type coercion. See [Data Types](#). If you do not specify a type, the table uses the Vertica defaults.

You cannot specify any other column properties, such as defaults or constraints.

Columns that are specified but not found in the Iceberg schema are ignored.

Privileges

Superuser, or non-superuser with the following privileges:

- READ privileges on the USER-accessible storage location. See [GRANT \(storage location\)](#)
- Full access (including SELECT) to an external table that the user has privileges to create

Path prefixes

Iceberg tables store file paths in the metadata as absolute URIs (host and port). Sometimes this URI differs from the URI that Vertica can use to access the data. This can particularly be an issue for files stored on HDFS, where the metadata can use a different URI scheme and port number than what Vertica expects.

To change the URIs, set the [IcebergPathMapping](#) configuration parameter. The value is a list of one or more pairs of Iceberg URI prefixes and corresponding Vertica prefixes:

```
-> ALTER SESSION SET IcebergPathMapping=
  ('hdfs://node-196.example.com:9000':"webhdfs://node-196.example.com:9870");
```

Include only the URI prefix (up through the port), not complete paths. If IcebergPathMapping contains more than one mapping that could apply, Vertica uses the longest entry that matches.

You can set IcebergPathMapping at the database, session, or user level.

Data types

The following table shows the mappings of Iceberg data types to Vertica data types. For types that allow it, you can use the COLUMN TYPES clause to override these defaults.

Iceberg Type	Vertica Type	Allows Override?
boolean	BOOLEAN	No
int (32-bit)	INT	No
long (64-bit)	INT	No
float (32-bit)	FLOAT	No
double (64-bit)	FLOAT	No
decimal(precision, scale)	NUMERIC with same precision and scale	No
date	DATE	No
time	TIME	No
timestamp	TIMESTAMP	No
timestamptz	TIMESTAMP WITH TIMEZONE	No
string	VARCHAR(80)	VARCHAR or LONG VARCHAR with custom length
uuid	UUID	No
fixed(length)	BINARY(length) if length <= 65000 LONG VARBINARY(length) otherwise	No
binary (variable length)	VARBINARY(80)	VARBINARY or LONG VARBINARY with custom length
struct	ROW	No, but you can override individual fields if their types permit
list	ARRAY (default bound)	ARRAY with custom bound
map<key, value>	ARRAY[ROW(key, value)] (default bound)	ARRAY[ROW(key, value)] with custom bound

Restrictions

The following restrictions apply to external tables backed by Iceberg:

- Data files must be in Parquet format.
- Metadata files must use [version 1 or version 2 format](#).
- Iceberg column defaults are not supported.
- Iceberg delete files are not supported.
- Malformed data is an error that aborts the load. You cannot reject bad data and continue.
- VARCHAR values are not truncated. If a string is too long, it is treated as an error.

The following restrictions apply to queries of Iceberg tables:

- You cannot use a column in an Iceberg table as a DEFAULT or SET USING option in another table. The following example is an error:

```
=> CREATE TABLE t1
  id INT DEFAULT (SELECT COUNT(*) FROM iceberg_table);
ERROR 0: Default and set using expressions cannot refer to external iceberg tables
```

- Errors in Iceberg data or metadata, such as missing files or type mismatches, can manifest as query errors such as the following:

```
=> SELECT * FROM iceberg_table;
ERROR 0: Problem reading metadata for table iceberg_table. Detail: Could not determine type of column a. User specified type: int. Iceberg type: boolean
```

Examples

The following example creates a table based on the Parquet data files with no overrides:

```
=> CREATE EXTERNAL TABLE sales
  STORED BY ICEBERG LOCATION 's3:/sales/';
```

In the following example, the data uses a struct for the shipping address, with fields for street address (string), city (string), and zip code (integer). The following table definition overrides the default VARCHAR lengths. Note that the zip code is not included in COLUMN TYPES overrides. The ROW column contains only the fields being changed, but all fields including the zip code are part of the table definition and are included in query results:

```
=> CREATE EXTERNAL TABLE sales
  STORED BY ICEBERG LOCATION 's3:/sales/'
  COLUMN TYPES (address ROW(street VARCHAR(50), city VARCHAR(50)));
```

See also

EXTERNAL_DATA_FILES_PRUNED event in [QUERY_EVENTS](#).

CREATE FAULT GROUP

Enterprise Mode only

Creates a fault group, which can contain the following:

- One or more nodes
- One or more child fault groups
- One or more nodes and one or more child fault groups

CREATE FAULT GROUP creates an empty fault group. Use [ALTER FAULT GROUP](#) to add nodes or other fault groups to an existing fault group.

Syntax

```
CREATE FAULT GROUP name
```

Parameters

name

The name of the fault group to create, unique among all fault groups, where *name* conforms to conventions described in [Identifiers](#).

Privileges

Superuser

Examples

The following command creates a fault group called `parent0` :

```
=> CREATE FAULT GROUP parent0;
CREATE FAULT GROUP
```

See also

- [FAULT_GROUPS](#)
- [CLUSTER_LAYOUT](#)
- [Fault groups](#)
- [High availability with fault groups](#)

CREATE FLEXIBLE EXTERNAL TABLE AS COPY

CREATE FLEXIBLE EXTERNAL TABLE AS COPY creates a flexible external table. This statement combines statements [CREATE FLEXIBLE TABLE](#) and [COPY](#) statements, supporting a subset of each statement's parameters.

You can also use [user-defined load functions](#) (UDLs) to create external flex tables. For details about creating and using flex tables, see [Using Flex Tables](#).

Note

Vertica does not create a superprojection for an external table when you create it.

For details about creating and using flex tables, see [Creating flex tables](#) in [Using Flex Tables](#).

Caution

Canceling a `CREATE FLEX EXTERNAL TABLE AS COPY` statement can cause unpredictable results. Vertica recommends that you allow the statement to finish, then use `DROP TABLE` after the table exists.

Syntax

```
CREATE FLEX[IBLE] EXTERNAL TABLE [ IF NOT EXISTS ] [[database.]schema.]table-name
  ( [ column-definition[,...] ] )
  [ INCLUDE | EXCLUDE [SCHEMA] PRIVILEGES ]
AS COPY [ ( { column-as-expression | column } [ FILLER datatype ] ]
FROM {
  'path-to-data' [ ON nodename | ON ANY NODE | ON (nodeset) ] input-format [...]
  | [ WITH ] UDL-clause[...]
}
[ ABORT ON ERROR ]
[ DELIMITER [ AS ] 'char' ]
[ ENCLOSED [ BY ] 'char' ]
[ ENFORCELENGTH ]
[ ESCAPE [ AS ] 'char' | NO ESCAPE ]
[ EXCEPTIONS 'path' [ ON nodename ] [...] ]
[ NULL [ AS ] 'string' ]
[ RECORD TERMINATOR 'string' ]
[ REJECTED DATA 'path' [ ON nodename ] [...] ]
[ REJECTMAX integer ]
[ SKIP integer ]
[ SKIP BYTES integer ]
[ TRAILING NULLCOLS ]
[ TRIM 'byte' ]
```

Parameters

For parameter descriptions, see [CREATE TABLE](#) and [Parameters](#).

Note

`CREATE FLEXIBLE EXTERNAL TABLE AS COPY` supports only a subset of `CREATE TABLE` and `COPY` parameters.

Privileges

Superuser, or non-superuser with the following privileges:

- READ privileges on the USER-accessible storage location. See [GRANT \(storage location\)](#)
- Full access (including SELECT) to an external table that the user has privileges to create

Examples

To create an external flex table:

```
=> CREATE flex external table mountains() AS COPY FROM 'home/release/KData/kmm_ountains.json' PARSER fjsonparser();
CREATE TABLE
```

As with other flex tables, creating an external flex table produces two regular tables: the named table and its associated `_keys` table. The keys table is not an external table:

```
=> \dt mountains
      List of tables
Schema | Name  | Kind | Owner | Comment
-----+-----+-----+-----+-----
public | mountains | table | release |
(1 row)
```

You can use the helper function, [COMPUTE_FLEXTABLE_KEYS_AND_BUILD_VIEW](#), to compute keys and create a view for the external table:

```
=> SELECT compute_flextable_keys_and_build_view ('appLog');

      compute_flextable_keys_and_build_view
-----+-----
Please see public.appLog_keys for updated keys
The view public.appLog_view is ready for querying
(1 row)
```

Check the keys from the `_keys` table for the results of running the helper application:

```
=> SELECT * FROM appLog_keys;

      key_name          | frequency | data_type_guess
-----+-----+-----
contributors            |         8 | varchar(20)
coordinates             |         8 | varchar(20)
created_at              |         8 | varchar(60)
entities.hashtags      |         8 | long varbinary(186)
.
.
.
retweeted_status.user.time_zone |         1 | varchar(20)
retweeted_status.user.url   |         1 | varchar(68)
retweeted_status.user.utc_offset |         1 | varchar(20)
retweeted_status.user.verified |         1 | varchar(20)
(125 rows)
```

You can query the view:

```
=> SELECT "user.lang" FROM appLog_view;
      user.lang
-----
it
en
es
en
en
es
tr
en
(12 rows)
```

See also

- [CREATE EXTERNAL TABLE AS COPY](#)

CREATE FLEXIBLE TABLE

Creates a flexible (flex) table in the logical schema.

When you create a flex table, Vertica automatically creates two dependent objects:

- Keys table that is named `flex-table-name _keys`
- View that is named `flex-table-name _view`

The flex table requires the keys table and view. Neither of these objects can exist independently of the flex table.

Create with column definitions :

```
CREATE [[ scope ] TEMP[ORARY]] FLEX[IBLE] TABLE [ IF NOT EXISTS ]
  [[database.]schema.]table-name
  ( [ column-definition[,...] [, table-constraint ][,...] ] )
  [ ORDER BY column[,...] ]
  [ segmentation-spec ]
  [ KSAFE [k-num] ]
  [ partition-clause ]
  [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
  [ DISK_QUOTA quota ]
```

Create from another table:

```
CREATE FLEX[IBLE] TABLE [[database.]schema.] table-name
  [ ( column-name-list ) ]
  [ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
  AS query [ ENCODED BY column-ref-list ]
  [ DISK_QUOTA quota ]
```

Parameters

For general parameter descriptions, see [CREATE TABLE](#) ; for parameters specific to temporary flex tables, see [CREATE TEMPORARY TABLE](#) and [Creating flex tables](#) .

You cannot partition a flex table on any virtual column (key).

Privileges

Non-superuser: CREATE privilege on table schema

Default columns

The CREATE statement can omit specifying any column definitions. CREATE FLEXIBLE TABLE always creates two columns automatically:

__raw__
LONG VARBINARY type column to store unstructured data that you load. By default, this column has a **NOT NULL** constraint.

__identity__
[IDENTITY](#) column that is used for segmentation and sorting when no other column is defined.

Default projections

Vertica automatically creates [superprojections](#) for both the flex table and keys tables when you create them.

If you create a flex table with one or more of the ORDER BY, ENCODED BY, SEGMENTED BY, or KSAFE clauses, the clause information is used to create projections. If no clauses are in use, Vertica uses the following defaults:

Table	Sort order	Encoding	Segmentation	K-safety
Flexible table	ORDER BY *.__identity__	none	SEGMENTED BY hash *.__identity__ ALL NODES OFFSET 0	1
Keys table	ORDER BY *.__keys_frequency	none	UNSEGMENTED ALL NODES	1

Note

When you build a view for a flex table (see [BUILD_FLEXTABLE_VIEW](#)), the view is ordered by frequency , desc , and key_name .

Examples

The following example creates a flex table named **darkdata** without specifying any column information. Vertica creates a default superprojection and buddy projection as part of creating the table:

```

=> CREATE FLEXIBLE TABLE darkdata();
CREATE TABLE
=> \dj darkdata1*
      List of projections
Schema |      Name      | Owner |      Node      | Comment
-----+-----+-----+-----+-----
public | darkdata1_b0   | dbadmin |                |
public | darkdata1_b1   | dbadmin |                |
public | darkdata1_keys_super | dbadmin | v_vmart_node0001 |
public | darkdata1_keys_super | dbadmin | v_vmart_node0002 |
public | darkdata1_keys_super | dbadmin | v_vmart_node0003 |
(5 rows)

=> SELECT export_objects(",'darkdata1_b0');
CREATE PROJECTION public.darkdata1_b0 /*+basename(darkdata1),createtype(P)*/
(
  __identity__,
  __raw__
)
AS
SELECT darkdata1.__identity__,
       darkdata1.__raw__
FROM public.darkdata1
ORDER BY darkdata1.__identity__
SEGMENTED BY hash(darkdata1.__identity__) ALL NODES OFFSET 0;

SELECT MARK_DESIGN_KSAFE(1);
(1 row)

=> select export_objects(",'darkdata1_keys_super');
CREATE PROJECTION public.darkdata1_keys_super /*+basename(darkdata1_keys),createtype(P)*/
(
  key_name,
  frequency,
  data_type_guess
)
AS
SELECT darkdata1_keys.key_name,
       darkdata1_keys.frequency,
       darkdata1_keys.data_type_guess
FROM public.darkdata1_keys
ORDER BY darkdata1_keys.frequency
UNSEGMENTED ALL NODES;

SELECT MARK_DESIGN_KSAFE(1);
(1 row)

```

The following example creates a table called `darkdata1` with one column definition (`date_col`). The statement specifies the `partition by` clause to partition the data by year. Vertica creates a default superprojection and buddy projections as part of creating the table:

```

=> CREATE FLEX TABLE darkdata1 (date_col date NOT NULL) partition by
  extract('year' from date_col);
CREATE TABLE

```

See also

- [Creating flex tables](#)
- [CREATE FLEXIBLE EXTERNAL TABLE AS COPY](#)

CREATE FUNCTION statements

Vertica provides CREATE statements for each type of [user-defined extension](#). Each CREATE statement adds a user-defined function to the Vertica catalog:

CREATE statement	Extension
CREATE FUNCTION (scalar)	User-defined scalar functions (UDSFs)
CREATE AGGREGATE FUNCTION	User-defined aggregate functions (UDAFs)
CREATE ANALYTIC FUNCTION	User-defined analytic functions (UDAnF)
CREATE TRANSFORM FUNCTION	User-defined transform functions (UDTFs)
CREATE statements for user-defined load :	
• CREATE SOURCE	Load source functions
• CREATE FILTER	Load filter functions
• CREATE PARSER	Load parser functions

Vertica also provides [CREATE FUNCTION \(SQL\)](#), which stores SQL expressions as functions that you can invoke in a query.

In this section

- [CREATE AGGREGATE FUNCTION](#)
- [CREATE ANALYTIC FUNCTION](#)
- [CREATE FILTER](#)
- [CREATE FUNCTION \(scalar\)](#)
- [CREATE FUNCTION \(SQL\)](#)
- [CREATE PARSER](#)
- [CREATE SOURCE](#)
- [CREATE TRANSFORM FUNCTION](#)

CREATE AGGREGATE FUNCTION

Adds a [user-defined aggregate function](#) (UDAF) to the catalog. The library containing the function must have been previously added using [CREATE LIBRARY](#).

CREATE AGGREGATE FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading aggregate functions. When you call the SQL function, Vertica passes the input table to the function to process.

User-defined aggregate functions run in [unfenced mode](#) only.

Syntax

```
CREATE [ OR REPLACE ] AGGREGATE FUNCTION [ IF NOT EXISTS ]
[[database.]schema.]function AS
[ LANGUAGE 'language' ]
NAME 'factory'
LIBRARY library
[ NOT FENCED ];
```

Arguments

OR REPLACE

If a function with the same name and arguments exists, replace it. You can use this to change between fenced and unfenced modes, for example. If you do not use this directive and the function already exists, the CREATE statement returns with a rollback error.

OR REPLACE and IF NOT EXISTS are mutually exclusive.

IF NOT EXISTS

If a function with the same name and arguments exists, return without creating the function.

OR REPLACE and IF NOT EXISTS are mutually exclusive.

[*database* .] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function

Name of the function to create. This is the name used in SQL invocations of the function. It does not need to match the name of the factory, but it is less confusing if they are the same or similar.

The function name must conform to the restrictions on [Identifiers](#).

LANGUAGE ' *language* '

The language used to develop this function, currently `C++` only (the default).

NAME ' *factory* '

Name of the factory class that generates the function instance.

LIBRARY *library*

Name of the shared library that contains the function. This library must have already been loaded by [CREATE LIBRARY](#).

NOT FENCED

Indicates that the function runs in unfenced mode. Aggregate functions cannot be run in fenced mode.

Privileges

Non-superuser:

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

Examples

The following example demonstrates loading a library named `AggregateFunctions` and then defining functions named `ag_avg` and `ag_cat`. The functions are mapped to the `AverageFactory` and `ConcatenateFactory` classes in the library:

```

=> CREATE LIBRARY AggregateFunctions AS '/opt/vertica/sdk/examples/build/AggregateFunctions.so';
CREATE LIBRARY
=> CREATE AGGREGATE FUNCTION ag_avg AS LANGUAGE 'C++' NAME 'AverageFactory'
  library AggregateFunctions;
CREATE AGGREGATE FUNCTION
=> CREATE AGGREGATE FUNCTION ag_cat AS LANGUAGE 'C++' NAME 'ConcatenateFactory'
  library AggregateFunctions;
CREATE AGGREGATE FUNCTION
=> \x

```

Expanded display is on.

```
select * from user_functions;
```

```

-[ RECORD 1 ]-----+-----
schema_name      | public
function_name    | ag_avg
procedure_type   | User Defined Aggregate
function_return_type | Numeric
function_argument_type | Numeric
function_definition | Class 'AverageFactory' in Library 'public.AggregateFunctions'
volatility       |
is_strict        | f
is_fenced        | f
comment          |
-[ RECORD 2 ]-----+-----
schema_name      | public
function_name    | ag_cat
procedure_type   | User Defined Aggregate
function_return_type | Varchar
function_argument_type | Varchar
function_definition | Class 'ConcatenateFactory' in Library 'public.AggregateFunctions'
volatility       |
is_strict        | f
is_fenced        | f
comment          |

```

- [Aggregate functions \(UDAFs\)](#)

CREATE ANALYTIC FUNCTION

Adds a [user-defined analytic function](#) (UDAnF) to the catalog. The library containing the function must have been previously added using [CREATE LIBRARY](#).

CREATE ANALYTIC FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading analytic functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

Syntax

```

CREATE [ OR REPLACE ] ANALYTIC FUNCTION [ IF NOT EXISTS ]
  [[database.]schema.]function AS
  [ LANGUAGE 'language' ]
  NAME 'factory'
  LIBRARY library
  [ FENCED | NOT FENCED ]

```

Arguments

OR REPLACE

If a function with the same name and arguments exists, replace it. You can use this to change between fenced and unfenced modes, for example. If you do not use this directive and the function already exists, the CREATE statement returns with a rollback error.

OR REPLACE and IF NOT EXISTS are mutually exclusive.

IF NOT EXISTS

If a function with the same name and arguments exists, return without creating the function.
OR REPLACE and IF NOT EXISTS are mutually exclusive.

[*database* .] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function

Name of the function to create. This is the name used in SQL invocations of the function. It does not need to match the name of the factory, but it is less confusing if they are the same or similar.

The function name must conform to the restrictions on [Identifiers](#).

LANGUAGE ' *language* '

Language used to develop this function, one of the following:

- `C++` (default)
- `Java`

NAME ' *factory* '

Name of the factory class that generates the function instance.

LIBRARY *library*

Name of the library that contains the function. This library must already be loaded by [CREATE LIBRARY](#).

FENCED | NOT FENCED

Enables or disables [fenced mode](#) for this function.

Default: `FENCED`

Privileges

Non-superuser:

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

Examples

This example creates an analytic function named `an_rank` based on the factory class named `RankFactory` in the `AnalyticFunctions` library:

```
=> CREATE ANALYTIC FUNCTION an_rank AS LANGUAGE 'C++'  
    NAME 'RankFactory' LIBRARY AnalyticFunctions;
```

See also

[Analytic functions \(UDAnFs\)](#)

CREATE FILTER

Adds a [user-defined load filter function](#) to the catalog. The library containing the filter function must have been previously added using [CREATE LIBRARY](#).

CREATE FILTER automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading load filter functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

Important

Installing an untrusted UDL function can compromise the security of the server. UDxs can contain arbitrary code. In particular, user-defined parser functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to UDxs to untrusted users.

Syntax

```
CREATE [ OR REPLACE ] FILTER [ IF NOT EXISTS ]  
    [[database.]schema.]function AS  
    [ LANGUAGE 'language' ]  
    NAME 'factory' LIBRARY library  
    [ FENCED | NOT FENCED ]
```

Arguments

OR REPLACE

If a function with the same name and arguments exists, replace it. You can use this to change between fenced and unfenced modes, for example. If you do not use this directive and the function already exists, the CREATE statement returns with a rollback error.

OR REPLACE and IF NOT EXISTS are mutually exclusive.

IF NOT EXISTS

If a function with the same name and arguments exists, return without creating the function.

OR REPLACE and IF NOT EXISTS are mutually exclusive.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

function

Name of the function to create. This is the name used in SQL invocations of the function. It does not need to match the name of the factory, but it is less confusing if they are the same or similar.

The function name must conform to the restrictions on [Identifiers](#).

LANGUAGE ' *language* '

The language used to develop this function, one of the following:

- [C++](#) (default)
- [Java](#)
- [Python](#)

NAME ' *factory* '

Name of the factory class that generates the function instance. This is the same name used by the RegisterFactory class.

LIBRARY *library*

Name of the C++ library shared object file, Python file, or Java Jar file. This library must already have been loaded by [CREATE LIBRARY](#).

FENCED | NOT FENCED

Enables or disables [fenced mode](#) for this function.

Default: [FENCED](#)

Privileges

Superuser

Examples

The following example demonstrates loading a library named [iConverterLib](#), then defining a filter function named [lconverter](#) that is mapped to the [iConverterFactory](#) factory class in the library:

```
=> CREATE LIBRARY iConverterLib as '/opt/vertica/sdk/examples/build/lconverterLib.so';
CREATE LIBRARY
=> CREATE FILTER lconverter AS LANGUAGE 'C++' NAME 'lconverterFactory' LIBRARY iConverterLib;
CREATE FILTER FUNCTION
=> \x
Expanded display is on.
=> SELECT * FROM user_functions;
-[ RECORD 1 ]-----+-----
schema_name      | public
function_name    | lconverter
procedure_type   | User Defined Filter
function_return_type |
function_argument_type |
function_definition |
volatility       |
is_strict        | f
is_fenced        | f
comment          |
```

See also

- [DROP FILTER](#)
- [USER FUNCTIONS](#)
- [User-defined load \(UDL\)](#)

CREATE FUNCTION (scalar)

Adds a [user-defined scalar function](#) (UDSF) to the catalog. The library containing the function must have been previously added using [CREATE LIBRARY](#).

A UDSF takes in a single row of data and returns a single value. These functions can be used anywhere a native Vertica function or statement can be used, except CREATE TABLE with its PARTITION BY or any segmentation clause.

CREATE FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading UDXs. When you call the function, Vertica passes the parameters to the function in the library to process.

Syntax

```
CREATE [ OR REPLACE ] FUNCTION [ IF NOT EXISTS ]
[[database.]schema.]function AS
[ LANGUAGE 'language' ]
NAME 'factory'
LIBRARY library
[ FENCED | NOT FENCED ]
```

Arguments

OR REPLACE

If a function with the same name and arguments exists, replace it. You can use this to change between fenced and unfenced modes, for example. If you do not use this directive and the function already exists, the CREATE statement returns with a rollback error.

OR REPLACE and IF NOT EXISTS are mutually exclusive.

IF NOT EXISTS

If a function with the same name and arguments exists, return without creating the function.

OR REPLACE and IF NOT EXISTS are mutually exclusive.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

function

Name of the function to create. This is the name used in SQL invocations of the function. It does not need to match the name of the factory, but it is less confusing if they are the same or similar.

The function name must conform to the restrictions on [Identifiers](#).

LANGUAGE ' *language* '

Language used to develop this function, one of the following:

- [C++](#) (default)
- [Python](#)
- [Java](#)
- [R](#)

NAME ' *factory* '

Name of the factory class that generates the function instance.

LIBRARY *library*

Name of the C++ shared object file, Python file, Java Jar file, or R functions file. This library must already have been loaded by [CREATE LIBRARY](#).

FENCED | NOT FENCED

Enables or disables [fenced mode](#) for this function. Functions written in Java and R always run in fenced mode.

Default: [FENCED](#)

Privileges

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

Examples

The following example loads a library named `ScalarFunctions` and then defines a function named `Add2ints` that is mapped to the `Add2intsInfo` factory class in the library:

```
=> CREATE LIBRARY ScalarFunctions AS '/opt/vertica/sdk/examples/build/ScalarFunctions.so';
CREATE LIBRARY
=> CREATE FUNCTION Add2Ints AS LANGUAGE 'C++' NAME 'Add2IntsFactory' LIBRARY ScalarFunctions;
CREATE FUNCTION
=> \x
Expanded display is on.
=> SELECT * FROM USER_FUNCTIONS;

-[ RECORD 1 ]-----+-----
schema_name      | public
function_name    | Add2Ints
procedure_type   | User Defined Function
function_return_type | Integer
function_argument_type | Integer, Integer
function_definition | Class 'Add2IntsFactory' in Library 'public.ScalarFunctions'
volatility       | volatile
is_strict        | f
is_fenced        | t
comment          |

=> \x
Expanded display is off.
=> -- Try a simple call to the function
=> SELECT Add2Ints(23,19);
Add2Ints
-----
      42
(1 row)
```

The following example uses a scalar function that returns a ROW:

```
=> CREATE FUNCTION div_with_rem AS LANGUAGE 'C++' NAME 'DivFactory' LIBRARY ScalarFunctions;

=> SELECT div_with_rem(18,5);
   div_with_rem
-----
{"quotient":3,"remainder":3}
(1 row)
```

See also

[Developing user-defined extensions \(UDxs\)](#)

CREATE FUNCTION (SQL)

Stores SQL expressions as functions for use in queries. User-defined SQL functions are useful for executing complex queries and combining Vertica built-in functions. You can call the function in a given query. If multiple SQL functions with the same name and argument types are in the search path, Vertica calls the first match that it finds.

SQL functions do not support complex types for arguments or return values.

SQL functions are flattened in all cases, including DDL.

Syntax

```
CREATE [ OR REPLACE ] FUNCTION [ IF NOT EXISTS ]
  [[database.]schema.]function( [ argname argtype[,...] ] )
  RETURN return_type
AS
BEGIN
  RETURN expression;
END;
```

Arguments

OR REPLACE

If a function of the same name and arguments exists, replace it. If you only change the function arguments, Vertica ignores this option and maintains both functions under the same name.

OR REPLACE and IF NOT EXISTS are mutually exclusive.

IF NOT EXISTS

If a function with the same name and arguments exists, return without creating the function.

OR REPLACE and IF NOT EXISTS are mutually exclusive.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

function

Name of the function to create, which must conform to the conventions described in [Identifiers](#).

argname argtype [...]

A comma-delimited list of argument names and their [data types](#). Complex types are not supported.

return_type

The data type that this function returns. Complex types are not supported.

RETURN *expression*

The SQL function body, which can contain built-in functions, operators, and argument names specified in the CREATE FUNCTION statement. The expression must end with a semicolon.

Note

CREATE FUNCTION allows only one RETURN expression. Return expressions do not support the following:

- FROM, WHERE, GROUP BY, ORDER BY, and LIMIT clauses
- Aggregation, analytics, and meta-functions

Privileges

Non-superuser:

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

Strictness and volatility

Vertica infers the [strictness](#) and volatility ([stable](#), [immutable](#), or [volatile](#)) of a SQL function from its definition. Vertica then determines the correctness of usage, such as where an immutable function is expected but a volatile function is provided.

SQL functions and views

You can [create views](#) on the queries that use SQL functions and then query the views. When you create a view, a SQL function replaces a call to the user-defined function with the function body in a view definition. Therefore, when the body of the user-defined function is replaced, the view should also be replaced.

Examples

See [Creating user-defined SQL functions](#).

See also

- [ALTER FUNCTION \(scalar\)](#)
- [DROP FUNCTION](#)
- [User-defined SQL functions](#)

CREATE PARSER

Adds a [user-defined load parser function](#) to the catalog. The library containing the function must have been previously added using [CREATE LIBRARY](#).

CREATE PARSER automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading load parser functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

Important
Installing an untrusted UDL function can compromise the security of the server. UDxs can contain arbitrary code. In particular, user-defined parser functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to UDxs to untrusted users.

Syntax

```
CREATE [ OR REPLACE ] PARSER [ IF NOT EXISTS ]  
  [[database.]schema.]function AS  
  [ LANGUAGE 'language' ]  
  NAME 'factory'  
  LIBRARY library  
  [ FENCED | NOT FENCED ]
```

Arguments

OR REPLACE

If a function with the same name and arguments exists, replace it. You can use this to change between fenced and unfenced modes, for example. If you do not use this directive and the function already exists, the CREATE statement returns with a rollback error. OR REPLACE and IF NOT EXISTS are mutually exclusive.

IF NOT EXISTS

If a function with the same name and arguments exists, return without creating the function. OR REPLACE and IF NOT EXISTS are mutually exclusive.

[*database* .] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function

Name of the function to create. This is the name used in SQL invocations of the function. It does not need to match the name of the factory, but it is less confusing if they are the same or similar.

The function name must conform to the restrictions on [Identifiers](#).

LANGUAGE '*language*'

The language used to develop this function, one of the following:

- C++ (default)
- Java
- Python

NAME '*factory*'

Name of the factory class that generates the function instance. This is the same name used by the RegisterFactory class.

LIBRARY *library*

Name of the C++ library shared object file, Python file, or Java Jar file. This library must already have been loaded by [CREATE LIBRARY](#).

FENCED | NOT FENCED

Enables or disables [fenced mode](#) for this function.

Default: `FENCED`

Privileges

Superuser

Examples

The following example demonstrates loading a library named `BasicIntegerParserLib`, then defining a parser function named `BasicIntegerParser` that is mapped to the `BasicIntegerParserFactory` factory class in the library:

```

=> CREATE LIBRARY BasicIntegerParserLib as '/opt/vertica/sdk/examples/build/BasicIntegerParser.so';
CREATE LIBRARY
=> CREATE PARSER BasicIntegerParser AS LANGUAGE 'C++' NAME 'BasicIntegerParserFactory' LIBRARY BasicIntegerParserLib;
CREATE PARSER FUNCTION
=> \x
Expanded display is on.
=> SELECT * FROM user_functions;
-[ RECORD 1 ]-----+-----
schema_name      | public
function_name    | BasicIntegerParser
procedure_type   | User Defined Parser
function_return_type |
function_argument_type |
function_definition |
volatility       |
is_strict        | f
is_fenced        | f
comment          |

```

See also

- [DROP PARSER](#)
- [USER FUNCTIONS](#)
- [User-defined load \(UDL\)](#)

CREATE SOURCE

Adds a [user-defined load source function](#) to the catalog. The library containing the function must have been previously added using [CREATE LIBRARY](#).

CREATE SOURCE automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading load source functions. When you call the SQL function, Vertica passes the input table to the function in the library to process.

Important

Installing an untrusted UDL function can compromise the security of the server. UDxs can contain arbitrary code. In particular, user-defined parser functions can read data from any arbitrary location. It is up to the developer of the function to enforce proper security limitations. Superusers must not grant access to UDxs to untrusted users.

Syntax

```

CREATE [ OR REPLACE ] SOURCE [ IF NOT EXISTS ]
  [[database.]schema.]function AS
  [ LANGUAGE 'language' ]
  NAME 'factory'
  LIBRARY library
  [ FENCED | NOT FENCED ]

```

Arguments

OR REPLACE

If a function with the same name and arguments exists, replace it. You can use this to change between fenced and unfenced modes, for example. If you do not use this directive and the function already exists, the CREATE statement returns with a rollback error. OR REPLACE and IF NOT EXISTS are mutually exclusive.

IF NOT EXISTS

If a function with the same name and arguments exists, return without creating the function. OR REPLACE and IF NOT EXISTS are mutually exclusive.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

function

Name of the function to create. This is the name used in SQL invocations of the function. It does not need to match the name of the factory, but it is less confusing if they are the same or similar.

The function name must conform to the restrictions on [Identifiers](#).

LANGUAGE ' *language* '

Language used to develop this function, one of the following:

- C++ (default)
- Java

NAME ' *factory* '

Name of the factory class that generates the function instance. This is the same name used by the RegisterFactory class.

LIBRARY *library*

Name of the C++ library shared object file or Java Jar file. This library must already have been loaded by [CREATE LIBRARY](#).

FENCED | NOT FENCED

Enables or disables [fenced mode](#) for this function.

Default: **FENCED**

Privileges

Superuser

Examples

The following example demonstrates loading a library named `curlib`, then defining a source function named `curl` that is mapped to the `CurlSourceFactory` factory class in the library:

```
=> CREATE LIBRARY curlib as '/opt/vertica/sdk/examples/build/cURLLib.so';
CREATE LIBRARY
=> CREATE SOURCE curl AS LANGUAGE 'C++' NAME 'CurlSourceFactory' LIBRARY curlib;
CREATE SOURCE
=> \x
Expanded display is on.
=> SELECT * FROM user_functions;
[ RECORD 1 ]-----
schema_name      | public
function_name     | curl
procedure_type   | User Defined Source
function_return_type |
function_argument_type |
function_definition |
volatility        |
s_strict         | f
s_fenced         | f
comment          |
```

See also

- [DROP SOURCE](#)
- [USER_FUNCTIONS](#)
- [User-defined load \(UDL\)](#)

CREATE TRANSFORM FUNCTION

Adds a [user-defined transform function](#) (UDTF) to the catalog. The library containing the function must have been previously added using [CREATE LIBRARY](#).

CREATE TRANSFORM FUNCTION automatically determines the function parameters and return value from data supplied by the factory class. Vertica supports overloading transform functions. When you call the SQL function, Vertica passes the input table to the transform function in the library to process.

Syntax

```
CREATE [ OR REPLACE ] TRANSFORM FUNCTION [ IF NOT EXISTS ]
```

```
[[database.]schema.]function AS  
[ LANGUAGE 'language' ]  
NAME 'factory'  
LIBRARY library  
[ FENCED | NOT FENCED ]
```

Arguments

OR REPLACE

If a function with the same name and arguments exists, replace it. You can use this to change between fenced and unfenced modes, for example. If you do not use this directive and the function already exists, the CREATE statement returns with a rollback error.

OR REPLACE and IF NOT EXISTS are mutually exclusive.

IF NOT EXISTS

If a function with the same name and arguments exists, return without creating the function.

OR REPLACE and IF NOT EXISTS are mutually exclusive.

[*database* .] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function

Name of the function to create. This is the name used in SQL invocations of the function. It does not need to match the name of the factory, but it is less confusing if they are the same or similar.

The function name must conform to the restrictions on [Identifiers](#).

LANGUAGE ' *language* '

The language used to develop this function, one of the following:

- C++ (default)
- Java
- R
- Python

NAME ' *factory* '

Name of the factory class that generates the function instance.

LIBRARY *library*

Name of the C++ shared object file, Python file, Java Jar file, or R functions file. This library must already have been loaded by [CREATE LIBRARY](#).

FENCED | NOT FENCED

Enables or disables [fenced mode](#) for this function. Functions written in Java and R always run in fenced mode.

Default: `FENCED`

Privileges

Non-superuser:

- CREATE privilege on the function's schema
- USAGE privilege on the function's library

Restrictions

A query that includes a UDTF cannot:

- Include statements other than the [SELECT](#) statement that calls the UDTF and a PARTITION BY expression unless the UDTF is marked as a [one-to-many UDTF](#)
- Call an [analytic function](#)
- Call another UDTF
- Include one of the following clauses:
 - [TIMESERIES](#)
 - [Pattern matching](#)
 - [Gap filling and interpolation](#)

Examples

The following example loads a library named `TransformFunctions` and then defines a function named `tokenize` that is mapped to the `TokenFactory` factory class in the library:

```
=> CREATE LIBRARY TransformFunctions AS
  '/home/dbadmin/TransformFunctions.so';
CREATE LIBRARY
=> CREATE TRANSFORM FUNCTION tokenize
  AS LANGUAGE 'C++' NAME 'TokenFactory' LIBRARY TransformFunctions;
CREATE TRANSFORM FUNCTION
```

See also

- [DROP FUNCTION](#)
- [Developing user-defined extensions \(UDxs\)](#)

CREATE HCATALOG SCHEMA

Define a schema for data stored in a Hive data warehouse using the HCatalog Connector. For more information, see [Using the HCatalog Connector](#).

Most of the optional parameters are read out of Hadoop configuration files if available. If you copied the Hadoop configuration files as described in [Configuring Vertica for HCatalog](#), you can omit most parameters. By default this statement uses the values specified in those configuration files. If the configuration files are complete, the following is a valid statement:

```
=> CREATE HCATALOG SCHEMA hcat;
```

If a value is not specified in the configuration files and a default is shown in the parameter list, then that default value is used.

Some parameters apply only if you are using HiveServer2 (the default). Others apply only if you are using WebHCat, a legacy Hadoop service. When using HiveServer2, use `HIVESERVER2_HOSTNAME` to specify the server host. When using WebHCat, use `WEBSERVICE_HOSTNAME` to specify the server host.

If you need to use WebHCat you must also set the `HCatalogConnectorUseHiveServer2` configuration parameter to 0. See [Hadoop parameters](#).

After creating the schema, you can change many (but not all) parameters using [ALTER HCATALOG SCHEMA](#).

Syntax

```
CREATE HCATALOG SCHEMA [IF NOT EXISTS] schemaName
  [AUTHORIZATION user-id]
  [WITH [param=value [...]] ]
```

Arguments

Argument	Description
<code>[IF NOT EXISTS]</code>	If given, the statement exits without an error when the schema named in <i>schemaName</i> already exists.
<i>schemaName</i>	The name of the schema to create in the Vertica catalog. The tables in the Hive database will be available through this schema.
<code>AUTHORIZATION</code> <i>user-id</i>	The name of a Vertica account to own the schema being created. This parameter is ignored if Kerberos authentication is being used; in that case the current vsq user is used.

Parameters

Parameter	Description
-----------	-------------

HOSTNAME	<p>The hostname, IP address, or URI of the database server that stores the Hive data warehouse's metastore information.</p> <p>If you specify this parameter and do not also specify PORT, then this value must be in the URI format used for <code>hive.metastore.uris</code> in <code>hive-site.xml</code>.</p> <p>If the Hive metastore supports High Availability, you can specify a comma-separated list of URIs for this value.</p> <p>If this value is not specified, <code>hive-site.xml</code> must be available.</p>
PORT	<p>The port number on which the metastore database is running. If you specify this parameter, you must also specify HOSTNAME and it must be a name or IP address (not a URI).</p>
HIVESERVER2_HOSTNAME	<p>The hostname or IP address of the HiveServer2 service. This parameter is optional if in <code>hive-site.xml</code> you set one of the following properties:</p> <ul style="list-style-type: none"> • <code>hive.server2.thrift.bind.host</code> to a valid host • <code>hive.server2.support.dynamic.service.discovery</code> to true <p>This parameter is ignored if you are using WebHCat.</p>
WEBSERVICE_HOSTNAME	<p>The hostname or IP address of the WebHCat service, if using WebHCat instead of HiveServer2. If this value is not specified, <code>webhcat-site.xml</code> must be available.</p>
WEBSERVICE_PORT	<p>The port number on which the WebHCat service is running, if using WebHCat instead of HiveServer2. If this value is not specified, <code>webhcat-site.xml</code> must be available.</p>
WEBHDFS_ADDRESS	<p>The host and port ("host:port") for the WebHDFS service. This parameter is used only for reading ORC and Parquet files. If this value is not set, <code>hdfs-site.xml</code> must be available to read these file types through the HCatalog Connector.</p>
HCATALOG_SCHEMA	<p>The name of the Hive schema or database that the Vertica schema is being mapped to. The default is <i>schemaName</i>.</p>
CUSTOM_PARTITIONS	<p>Whether the Hive schema uses custom partition locations ('YES' or 'NO'). If the schema uses custom partition locations, then Vertica queries Hive to get those locations when executing queries. These additional Hive queries can be expensive, so use this parameter only if you need to. The default is 'NO' (disabled). For more information, see Using Partitioned Data.</p>
HCATALOG_USER	<p>The username of the HCatalog user to use when making calls to the HiveServer2 or WebHCat server. The default is the current database user.</p>
HCATALOG_CONNECTION_TIMEOUT	<p>The number of seconds the HCatalog Connector waits for a successful connection to the HiveServer or WebHCat server. A value of 0 means wait indefinitely.</p>
HCATALOG_SLOW_TRANSFER_LIMIT	<p>The lowest data transfer rate (in bytes per second) from the HiveServer2 or WebHCat server that the HCatalog Connector accepts. See <code>HCATALOG_SLOW_TRANSFER_TIME</code> for details.</p>
HCATALOG_SLOW_TRANSFER_TIME	<p>The number of seconds the HCatalog Connector waits before enforcing the data transfer rate lower limit. After this time has passed, the HCatalog Connector tests whether the data transfer rate is at least as fast as the value set in <code>HCATALOG_SLOW_TRANSFER_LIMIT</code>. If it is not, then the HCatalog Connector breaks the connection and terminates the query.</p>
SSL_CONFIG	<p>The path of the Hadoop <code>ssl-client.xml</code> configuration file. This parameter is required if you are using HiveServer2 and it uses SSL wire encryption. This parameter is ignored if you are using WebHCat.</p>

The default values for `HCATALOG_CONNECTOR_TIMEOUT`, `HCATALOG_SLOW_TRANSFER_LIMIT`, and `HCATALOG_SLOW_TRANSFER_TIME` are set by the database configuration parameters `HCatConnectionTimeout`, `HCatSlowTransferLimit`, and `HCatSlowTransferTime`. See [Hadoop parameters](#) for more information.

Configuration files

The HCatalog Connector uses the following values from the Hadoop configuration files if you do not override them when creating the schema.

File	Properties
hive-site.xml	hive.server2.thrift.bind.host (used for HIVESERVER2_HOSTNAME)
	hive.server2.thrift.port
	hive.server2.transport.mode
	hive.server2.authentication
	hive.server2.authentication.kerberos.principal
	hive.server2.support.dynamic.service.discovery
	hive.zookeeper.quorum (used as HIVESERVER2_HOSTNAME if dynamic service discovery is enabled)
	hive.zookeeper.client.port
	hive.server2.zookeeper.namespace
	hive.metastore.uris (used for HOSTNAME and PORT)
ssl-client.xml	ssl.client.truststore.location
	ssl.client.truststore.password

Privileges

The user must be a superuser or be granted all permissions on the database to use this statement.

The user also requires access to Hive data in one of the following ways:

- Have USAGE permissions on *hcatalog_schema*, if Hive does not use an authorization service (Sentry or Ranger) to manage access.
- Have permission through an authorization service, if Hive uses it to manage access. In this case you must either set `EnableHCatImpersonation` to 0, to access data as the Vertica principal, or grant users access to the HDFS data. For Sentry, you can use ACL synchronization to manage HDFS access.
- Be the dbadmin user, with or without an authorization service.

Examples

The following example shows how to use `CREATE HCATALOG SCHEMA` to define a new schema for tables stored in a Hive database and then query the system tables that contain information about those tables:

```
=> CREATE HCATALOG SCHEMA hcat WITH HOSTNAME='hcathost' PORT=9083
  HCATALOG_SCHEMA='default' HIVESERVER2_HOSTNAME='hs.example.com'
  SSL_CONFIG='/etc/hadoop/conf/ssl-client.xml' HCATALOG_USER='admin';
CREATE SCHEMA
=> \x
Expanded display is on.
```

```
=> SELECT * FROM v_catalog.hcatalog_schemata;
-[ RECORD 1 ]-----+-----
schema_id      | 45035996273748224
schema_name    | hcat
schema_owner_id | 45035996273704962
schema_owner   | admin
create_time    | 2017-12-05 14:43:03.353404-05
hostname       | hcathost
port           | -1
hiveserver2_hostname | hs.example.com
webservice_hostname |
webservice_port | 50111
webhdfs_address | hs.example.com:50070
hcatalog_schema_name | default
ssl_config     | /etc/hadoop/conf/ssl-client.xml
hcatalog_user_name | admin
hcatalog_connection_timeout | -1
hcatalog_slow_transfer_limit | -1
hcatalog_slow_transfer_time | -1
custom_partitions | f
```

```
=> SELECT * FROM v_catalog.hcatalog_table_list;
-[ RECORD 1 ]-----+-----
table_schema_id | 45035996273748224
table_schema    | hcat
hcatalog_schema | default
table_name      | nation
hcatalog_user_name | admin
-[ RECORD 2 ]-----+-----
table_schema_id | 45035996273748224
table_schema    | hcat
hcatalog_schema | default
table_name      | raw
hcatalog_user_name | admin
-[ RECORD 3 ]-----+-----
table_schema_id | 45035996273748224
table_schema    | hcat
hcatalog_schema | default
table_name      | raw_rcfile
hcatalog_user_name | admin
-[ RECORD 4 ]-----+-----
table_schema_id | 45035996273748224
table_schema    | hcat
hcatalog_schema | default
table_name      | raw_sequence
hcatalog_user_name | admin
```

The following example shows how to specify more than one metastore host.

```
=> CREATE HCATALOG SCHEMA hcat
  WITH HOSTNAME='thrift://node1.example.com:9083,thrift://node2.example.com:9083';
```

The following example shows how to include custom partition locations:

```
=> CREATE HCATALOG SCHEMA hcat WITH HCATALOG_SCHEMA='default'  
    HIVESERVER2_HOSTNAME='hs.example.com'  
    CUSTOM_PARTITIONS='yes';
```

CREATE KEY

Creates a private key.

Syntax

```
CREATE [TEMP[ORARY]] KEY name  
    { 'AES' [ PASSWORD 'password' ] | 'RSA' }  
    {LENGTH length | AS key_text}
```

Parameters

TEMPORARY

Create with session scope. The key is stored in memory and is valid only for the current session.

name

The name of the key.

password

Password for the key.

length

Size of the key in bits.

Example: 2048

key_text

The contents of the key to import.

Example:

```
-----BEGIN RSA PRIVATE KEY-----...ABCD1234...-----END RSA PRIVATE KEY-----
```

Privileges

Superuser

Examples

See [Generating TLS certificates and keys](#).

See also

- [CREATE CERTIFICATE](#)

CREATE LIBRARY

Loads a library containing user-defined extensions (UDxs) into the Vertica catalog. Vertica automatically distributes copies of the library file and supporting libraries to all cluster nodes.

Because libraries are added to the database catalog, they persist across database restarts.

After loading a library in the catalog, you can use statements such as [CREATE FUNCTION](#) to define the extensions contained in the library. See [Developing user-defined extensions \(UDxs\)](#) for details.

Syntax

```
CREATE [OR REPLACE] LIBRARY  
    [[database.]schema.]name  
    AS 'path'  
    [ DEPENDS 'depends-path' ]  
    [ LANGUAGE 'language' ]
```

Arguments

OR REPLACE

If a library with the same name exists, replace it. UDxs defined in the catalog that reference the updated library automatically start using the new library file.

If you do not use this directive and the library already exists, the CREATE statement returns with an error.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

name

Name of the library to create. This is the name used when creating functions in the library (see [Creating UDX Functions](#)). While not required, it is good practice to match the file name.

AS *path*

Path of the library to load, either an absolute path on the initiator node file system or a URI for another [supported file system or object store](#).

DEPENDS ' *depends-path* '

Files or libraries on which this library depends, one or more files or directories on the initiator node file system or other [supported file systems or object stores](#). For a directory, end the path entry with a slash (/), optionally followed by a wildcard (*). To specify more than one file, separate entries with colons (:).

If any path entry contain colons, such as a URI, place brackets around the entire DEPENDS path and use double quotes for the individual path elements, as in the following example:

```
DEPENDS ["s3://mybucket/gson-2.3.1.jar"]
```

To specify libraries with multiple directory levels, see [Multi-level Library Dependencies](#).

DEPENDS has no effect for libraries written in R. R packages must be installed locally on each node, including external dependencies.

Important

The performance of CREATE LIBRARY can degrade in Eon Mode, in proportion to the number and depth of dependencies specified by the DEPENDS clause.

If a Java library depends on native libraries (SO files), use DEPENDS to specify the path and call [System.loadLibrary\(\)](#) in your UDX to load the native libraries from that path.

LANGUAGE ' *language* '

The programming language of the functions in the library, one of:

- [C++](#) (default)
- [Python](#)
- [Java](#)
- [R](#)

Privileges

Superuser, or [UDXDEVELOPER](#) and CREATE on the schema. Non-superusers must explicitly enable the UDXDEVELOPER role, as in the following example:

```
=> SET ROLE UDXDEVELOPER;
SET
-- Not required, but you can confirm the role as follows:
=> SHOW ENABLED ROLES;
  name  | setting
-----+-----
enabled roles | udxdeveloper
(1 row)

=> CREATE LIBRARY MyLib AS '/home/dbadmin/my_lib.so';
CREATE LIBRARY
-- Create functions...

-- UDXDEVELOPER also grants DROP (replace):
=> CREATE OR REPLACE LIBRARY MyLib AS '/home/dbadmin/my_lib.so';
```

Requirements

- Vertica makes its own copies of the library files. Later modification or deletion of the original files specified in the statement does not affect the library defined in the catalog. To update the library, use [ALTER LIBRARY](#).

- Loading a library does not guarantee that it functions correctly. CREATE LIBRARY performs some basic checks on the library file to verify it is compatible with Vertica. The statement fails if it detects that the library was not correctly compiled or it finds other basic incompatibilities. However, CREATE LIBRARY cannot detect many other issues in shared libraries.

Multi-level library dependencies

If a DEPENDS clause specifies a library with multiple directory levels, Vertica follows the library path to include all subdirectories of that library. For example, the following CREATE LIBRARY statement enables the UDX library `mylib` to import all Python packages and modules that it finds in subdirectories of `site-packages` :

```
=> CREATE LIBRARY mylib AS '/path/to/python_udx' DEPENDS '/path/to/python/site-packages' LANGUAGE 'Python';
```

Important

DEPENDS can specify Java library dependencies that are up to 100 levels deep.

Examples

Load a library in the home directory of the dbadmin account:

```
=> CREATE LIBRARY MyFunctions AS '/home/dbadmin/my_functions.so';
```

Load a library located in the directory where you started `vsq`l :

```
=> \set libfile `pwd`/MyOtherFunctions.so\;
=> CREATE LIBRARY MyOtherFunctions AS :libfile;
```

Load a library from the cloud:

```
=> CREATE LIBRARY SomeFunctions AS 'S3://mybucket/extensions.so';
```

Load a library that depends on multiple JAR files in the same directory:

```
=> CREATE LIBRARY DeleteVowelsLib AS '/home/dbadmin/JavaLib.jar'
DEPENDS '/home/dbadmin/mylibs/*' LANGUAGE 'Java';
```

Load a library with multiple explicit dependencies:

```
=> CREATE LIBRARY mylib AS '/path/to/java_udx'
DEPENDS '/path/to/jars/this.jar:/path/to/jars/that.jar' LANGUAGE 'Java';
```

Load a library with dependencies in the cloud:

```
=> CREATE LIBRARY s3lib AS 's3://mybucket/UdLib.jar'
DEPENDS ['s3://mybucket/gson-2.3.1.jar'] LANGUAGE 'Java';
```

CREATE LOAD BALANCE GROUP

Creates a group of network addresses that can be targeted by a load balancing routing rule. You create a group either using a list of network addresses, or basing it on one or more fault groups or subclusters.

Note

You cannot add multiple network addresses for one node to the same load balancing group.

Syntax

```
CREATE LOAD BALANCE GROUP group_name WITH {
  ADDRESS address[,...]
  | FAULT GROUP fault_group[,...] FILTER 'IP_range'
  | SUBCLUSTER subcluster[,...] FILTER 'IP_range'
}
[ POLICY 'policy_setting' ]
```

Parameters

group_name

Name of the group to create. You use this name later when defining load balancing rules.

address [...]

Comma-delimited list of network addresses you created earlier.

fault_group [...]

Comma-delimited list of fault groups to use as the basis of the load balance group.

Note

Before you create your load balance group from a fault group, you must create network addresses on the nodes you want in your load balance group. Load balance groups only work with the network addresses you define on nodes, rather than IP addresses. See [CREATE NETWORK ADDRESS](#).

subcluster [...]

Comma-delimited list of subclusters to use as the basis of the load balance group.

Note

As with fault groups, you must create network addresses on the nodes in the subcluster you want to be part of the load balance group.

IP_range

Range of IP addresses in CIDR notation to include in the load balance group from the fault groups or subclusters. This range can be either IPv4 or IPv6. Only nodes that have a network address with an IP address that falls within this range are added to the load balancing group.

policy_setting

Determines how the initially-contacted node chooses a target from the group, one of the following:

- ROUNDROBIN (default) rotates among the available members of the load balancing group. The initially-contacted node keeps track of which node it chose last time, and chooses the next one in the cluster.

Note

Each node in the cluster maintains its own round-robin pointer that indicates which node it should pick next for each load-balancing group. Therefore, if clients connect to different initial nodes, they may be redirected to the same node.

- RANDOM chooses an available node from the group randomly.
- NONE disables load balancing.

Privileges

Superuser

Examples

The following statement demonstrates creating a load balance group that contains several network addresses:

```

=> CREATE NETWORK ADDRESS addr01 ON v_vmart_node0001 WITH '10.20.110.21';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS addr02 ON v_vmart_node0002 WITH '10.20.110.22';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS addr03 on v_vmart_node0003 WITH '10.20.110.23';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS addr04 on v_vmart_node0004 WITH '10.20.110.24';
CREATE NETWORK ADDRESS
=> CREATE LOAD BALANCE GROUP group_1 WITH ADDRESS addr01, addr02;
CREATE LOAD BALANCE GROUP
=> CREATE LOAD BALANCE GROUP group_2 WITH ADDRESS addr03, addr04;
CREATE LOAD BALANCE GROUP

=> SELECT * FROM LOAD_BALANCE_GROUPS;
  name | policy | filter | type | object_name
-----+-----+-----+-----+-----
group_1 | ROUNDROBIN | | Network Address Group | addr01
group_1 | ROUNDROBIN | | Network Address Group | addr02
group_2 | ROUNDROBIN | | Network Address Group | addr03
group_2 | ROUNDROBIN | | Network Address Group | addr04
(4 rows)

```

This example demonstrates creating a load balancing group using a fault group:

```

=> CREATE FAULT GROUP fault_1;
CREATE FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE v_vmart_node0001;
ALTER FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE v_vmart_node0002;
ALTER FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE v_vmart_node0003;
ALTER FAULT GROUP
=> ALTER FAULT GROUP fault_1 ADD NODE v_vmart_node0004;
ALTER FAULT GROUP
=> SELECT node_name,node_address,node_address_family,export_address
  FROM v_catalog.nodes;
  node_name | node_address | node_address_family | export_address
-----+-----+-----+-----
v_vmart_node0001 | 10.20.110.21 | ipv4 | 10.20.110.21
v_vmart_node0002 | 10.20.110.22 | ipv4 | 10.20.110.22
v_vmart_node0003 | 10.20.110.23 | ipv4 | 10.20.110.23
v_vmart_node0004 | 10.20.110.24 | ipv4 | 10.20.110.24
(4 rows)

=> CREATE LOAD BALANCE GROUP group_all WITH FAULT GROUP fault_1 FILTER
  '0.0.0.0/0';
CREATE LOAD BALANCE GROUP

=> CREATE LOAD BALANCE GROUP group_some WITH FAULT GROUP fault_1 FILTER
  '10.20.110.21/30';
CREATE LOAD BALANCE GROUP

=> SELECT * FROM LOAD_BALANCE_GROUPS;
  name | policy | filter | type | object_name
-----+-----+-----+-----+-----
group_all | ROUNDROBIN | 0.0.0.0/0 | Fault Group | fault_1
group_some | ROUNDROBIN | 10.20.110.21/30 | Fault Group | fault_1
(2 rows)

```

See also

- [ALTER NETWORK ADDRESS](#)
- [ALTER ROUTING RULE](#)
- [LOAD_BALANCE_GROUPS](#)
- [NETWORK_ADDRESSES](#)

CREATE LOCAL TEMPORARY VIEW

Creates or replaces a local temporary view. Views are read only, so they do not support insert, update, delete, or copy operations. Local temporary views are session-scoped, so they are visible only to their creator in the current session. Vertica drops the view when the session ends.

Note

Vertica does not support global temporary views.

Syntax

```
CREATE [OR REPLACE] LOCAL TEMP[ORARY] VIEW view [ (column[,...] ) ] AS query
```

Parameters

OR REPLACE

Specifies to overwrite the existing view *view-name* . If you omit this option and *view-name* already exists, **CREATE VIEW** returns an error.

view

Identifies the view to create, where *view* conforms to conventions described in [Identifiers](#) . It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

column [...]

List of up to 9800 names to use as view column names. Vertica maps view column names to query columns according to the order of their respective lists. By default, the view uses column names as they are specified in the query.

AS *query*

A [SELECT](#) statement that the temporary view executes. The **SELECT** statement can reference tables, temporary tables, and other views.

Privileges

See [Creating views](#) .

Examples

The following **CREATE LOCAL TEMPORARY VIEW** statement creates the temporary view *myview* . This view sums all individual incomes of customers listed in the *store.store_sales_fact* table, and groups results by state:

```
=> CREATE LOCAL TEMP VIEW myview AS
SELECT SUM(annual_income), customer_state FROM public.customer_dimension
WHERE customer_key IN (SELECT customer_key FROM store.store_sales_fact)
GROUP BY customer_state
ORDER BY customer_state ASC;
```

The following example uses the temporary view *myview* with a **WHERE** clause that limits the results to combined salaries greater than \$2 billion:

```
=> SELECT * FROM myview WHERE SUM > 2000000000;
```

SUM	customer_state
2723441590	AZ
29253817091	CA
4907216137	CO
3769455689	CT
3330524215	FL
4581840709	IL
3310667307	IN
2793284639	MA
5225333668	MI
2128169759	NV
2806150503	PA
2832710696	TN
14215397659	TX
2642551509	UT

(14 rows)

- [ALTER VIEW](#)
- [CREATE VIEW](#)
- [Creating views](#)

CREATE LOCATION

Creates a storage location where Vertica can store data. After you create the location, you create storage policies that assign the storage location to the database objects that will store data in the location.

Caution

While no technical issue prevents you from using **CREATE LOCATION** to add one or more Network File System (NFS) storage locations, Vertica does not support NFS data or catalog storage except for MapR mount points. You will be unable to run queries against any other NFS data. When creating locations on MapR file systems, you must specify **ALL NODES SHARED**.

If you use HDFS storage locations, the HDFS data must be available when you start Vertica. Your HDFS cluster must be operational, and the ROS files must be present. If you moved data files, or they are corrupted, or your HDFS cluster is not responsive, Vertica cannot start.

Syntax

```
CREATE LOCATION 'path'  
  [NODE 'node' | ALL NODES]  
  [SHARED]  
  [USAGE 'usage']  
  [LABEL 'label']  
  [LIMIT 'size']
```

Arguments

path

Where to store this location's data. The type of file system on which the location is based determines the *path* format:

- Linux: Absolute path to the directory where Vertica can write the storage location's data.
- Shared file systems: See the URL specifications in [HDFS file system](#), [S3 object store](#), [Google Cloud Storage \(GCS\) object store](#), and [Azure Blob Storage object store](#).

HDFS storage locations have [additional requirements](#).

Important

Vertica performs no validation on storage location paths. Confirm that the path value points to a valid location.

ALL NODES | NODE ' *node* '

The node or nodes on which the storage location is defined, one of the following:

- **ALL NODES** (default): Create the storage location on each node that is currently part of the cluster. If you later add nodes, you must also create the location on those nodes. If SHARED is also specified, create the storage location once for use by all nodes.
- **NODE ' *node* '**: Create the storage location on a single node, where *node* is the name of the node in the [NODES](#) system table. You cannot use this option with SHARED.

SHARED

Indicates the location set by *path* is shared (used by all nodes) rather than local to each node. You cannot specify individual nodes with SHARED; you must use ALL NODES.

Most remote file systems such as HDFS and S3 are shared. For these file systems, the *path* argument represents a single location in the remote file system where all nodes store data. If using a remote file system, you must specify SHARED, even for one-node clusters.

If *path* is set to S3 communal storage, **SHARED** is always implied and can be omitted.

Deprecated

SHARED DATA and SHARED DATA,TEMP storage locations are deprecated.

USAGE ' *usage* '

The type of data the storage location can hold, where *usage* is one of the following:

- **DATA,TEMP** (default): The storage location can store persistent and temporary DML-generated data, and data for temporary tables.
- **TEMP**: A *path*-specified location to store DML-generated temporary data. If *path* is set to S3, then this location is used only when the RemoteStorageForTemp configuration parameter is set to 1, and **TEMP** must be qualified with ALL NODES SHARED. For details, see [S3 Storage of Temporary Data](#).
- **DATA**: The storage location can only store persistent data.
- **USER**: Users with READ and WRITE [privileges](#) can access data and [external tables](#) of this storage location.
- **DEPOT**: The storage location is used in [Eon Mode](#) to store the depot. Only create **DEPOT** storage locations on local Linux file systems. Vertica allows a single **DEPOT** storage location per node. If you want to move your depot to different location (on a different file system, for example) you must first drop the old depot storage location, then create the new location.

LABEL ' *label* '

A label for the storage location, used when assigning the storage location to data objects. You use this name later when assigning the storage location to data objects.

Important

You must supply a label for depot storage locations.

LIMIT ' *size* '

Valid only if the storage location usage type is set to **DEPOT**, specifies the maximum amount of disk space that the depot can allocate from the storage location's file system.

You can specify *size* in two ways:

- ***integer* %**: Percentage of storage location disk size.
- ***integer* {K|M|G|T}**: Amount of storage location disk size in kilobytes, megabytes, gigabytes, or terabytes.

Important

The depot size cannot exceed 80 percent of the file system disk space where the depot is stored. If you specify a value that is too large, Vertica issues a warning and automatically changes the value to 80 percent of the file system size.

If you do not specify a limit, it is set to 60 percent.

Privileges

Superuser

File system access

The Vertica process must have read and write permissions to the location where data is to be stored. Each file system has its own requirements:

File system	Requirements
Linux	Database superuser account (usually named dbadmin) must have full read and write access to the directory in the <i>path</i> argument.
HDFS without Kerberos	A Hadoop user whose username matches the Vertica database administrator username (usually dbadmin) must have read and write access to the HDFS directory specified in the <i>path</i> argument. The UseServerIdentityOverUserIdentity configuration parameter must be set to true in the user session; otherwise Vertica tries to use the identity associated with the logged-in user.
HDFS with Kerberos	A Hadoop user whose username matches the principal in the keytab file on each Vertica node must have read and write access to the HDFS directory stored in the <i>path</i> argument. This is not the same as the database administrator username. The UseServerIdentityOverUserIdentity configuration parameter must be set to true in the user session; otherwise Vertica tries to use the Kerberos principal associated with the logged-in user.
Object stores (S3, GCS, Azure)	Database-level credentials must be specified and provide full read and write access to the location in the <i>path</i> argument. If session-level credentials are specified they are used, directly overriding the use of the storage location.

Examples

Create a storage location in the local Linux file system for temporary data storage:

```
=> CREATE LOCATION '/home/dbadmin/testloc' USAGE 'TEMP' LABEL 'tempfiles';
```

Create a storage location on HDFS. The HDFS cluster does not use Kerberos:

```
=> CREATE LOCATION 'hdfs://hadoopNS/vertica/colddata' ALL NODES SHARED
  USAGE 'data' LABEL 'coldstorage';
```

Create the same storage location, but on a Hadoop cluster that uses Kerberos. Note the output that reports the principal being used:

```
=> CREATE LOCATION 'hdfs://hadoopNS/vertica/colddata' ALL NODES SHARED
  USAGE 'data' LABEL 'coldstorage';
NOTICE 0: Performing HDFS operations using kerberos principal [vertica/hadoop.example.com]
CREATE LOCATION
```

Create a location for user data, grant access to it, and use it to create an external table:

```
=> CREATE LOCATION '/tmp' ALL NODES USAGE 'user';
CREATE LOCATION
=> GRANT ALL ON LOCATION '/tmp' to Bob;
GRANT PRIVILEGE
=> CREATE EXTERNAL TABLE ext1 (x integer) AS COPY FROM '/tmp/data/ext1.dat' DELIMITER ',';
CREATE TABLE
```

Create a user storage location on S3 and a role, so that users without their own S3 credentials can read data from S3 using the server credential:

```
-- set database-level credential (once):
=> ALTER DATABASE DEFAULT SET AWSSAuth = 'myaccesskeyid123456:mysecretaccesskey123456789012345678901234';

=> CREATE LOCATION 's3://datalake' SHARED USAGE 'USER' LABEL 's3user';

=> CREATE ROLE ExtUsers;
-- Assign users to this role using GRANT (Role).

=> GRANT READ ON LOCATION 's3://datalake' TO ExtUsers;
```

See also

- [Managing storage locations](#)
- [Using HDFS storage locations](#)
- [ALTER LOCATION_LABEL](#)
- [ALTER LOCATION_USE](#)
- [RETIRE_LOCATION](#)

- [SET_OBJECT_STORAGE_POLICY](#)

CREATE NAMESPACE

Eon Mode only

Creates a [namespace](#) for an Eon Mode database.

Important

If you create a non-default namespace, you cannot reshard the [default_namespace](#) or save an in-database restore point.

When you create a database, a [default_namespace](#) is created with the shard count defined during database creation. This function lets you create additional namespaces. Each namespace has a distinct shard count that determines the segmentation of its member objects. For more information, see [Managing namespaces](#) and [Namespaces and shards](#).

Every schema and table in an Eon Mode database belongs to a namespace. When you create a table or schema, you optionally specify the namespace under which to create the object. If no namespace is specified, the table or schema is created under the [default_namespace](#).

Syntax

```
CREATE NAMESPACE namespace-name [ SHARD COUNT shards ]
```

Arguments

namespace-name

Name of the namespace.

SHARD COUNT *shards*

Shard count of the namespace. If unspecified, the shard count is set to that of the [default_namespace](#).

Privileges

Superuser

Examples

Create the [analytics](#) namespace with a shard count of 12:

```
→ CREATE NAMESPACE analytics SHARD COUNT 12;  
CREATE NAMESPACE
```

You can view all namespaces in your database by querying the [NAMESPACES](#) system table:

```
→ SELECT namespace_name, is_default, default_shard_count FROM NAMESPACES;  
 namespace_name | is_default | default_shard_count  
-----  
 default_namespace | t         | 6  
 analytics       | f         | 12  
(2 rows)
```

For a more in-depth example, see [Managing namespaces](#).

- [DROP NAMESPACE](#)

CREATE NETWORK ADDRESS

Creates a network address that can be used as part of a connection load balancing policy. A network address creates a name in the Vertica catalog for an IP address and port number associated with a node. Nodes can have multiple network addresses, up to one for each IP address they have on the network.

Syntax

```
CREATE NETWORK ADDRESS name ON node WITH 'ip-address' [PORT port-number] [ENABLED | DISABLED]
```

Parameters

name

The name of the new network address. Use this name when creating connection load balancing groups.

node

The name of the node on which to create the network address. This should be name of the node as it appears in the `node_name` column of system table [NODES](#).

ip-address

The IPv4 or and IPv6 address on the node to associate with the network address.

Note

Vertica does not verify that the IP address you supply in this parameter is actually associated with the specified node. Be sure that the IP address actually belongs to the node. Otherwise, your load balancing policy is liable to send a client connection to the wrong node, or a non-Vertica host. Vertica rejects IP address that are invalid for a node. For example, it checks whether the IP address falls in the loopback address range of 127.0.0.0/8. If it finds that the IP address is invalid, CREATE NETWORK ADDRESS returns an error.

PORT *port-number*

Sets the port number for the network address. You must supply a network address when altering the port number.

ENABLED | DISABLED

Enables or disables the network address.

Privileges

Superuser

Examples

Create three network addresses, one for each node in a three-node cluster:

```
=> SELECT node_name,export_address from v_catalog.nodes;
  node_name  | export_address
-----+-----
v_vmart_br_node0001 | 10.20.100.62
v_vmart_br_node0002 | 10.20.100.63
v_vmart_br_node0003 | 10.20.100.64
(3 rows)

=> CREATE NETWORK ADDRESS node01 ON v_vmart_br_node0001 WITH '10.20.100.62';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS node02 ON v_vmart_br_node0002 WITH '10.20.100.63';
CREATE NETWORK ADDRESS
=> CREATE NETWORK ADDRESS node03 ON v_vmart_br_node0003 WITH '10.20.100.64';
```

See also

CREATE NETWORK INTERFACE

Identifies a network interface to which a node belongs.

Use this statement when you want to configure [import/export](#) operations from individual nodes to other Vertica clusters. By default, when you install Vertica, it creates interfaces for all connected networks. You would only need CREATE NETWORK INTERFACE in situations where the network topology has changed since you installed Vertica.

Note

Do not confuse this statement with [CREATE NETWORK ADDRESS](#), which is used to identify network addresses for connection load balancing (see [Connection load balancing policies](#)).

Syntax

```
CREATE NETWORK INTERFACE network-interface-name ON node-name [WITH] 'node-IP-address' [PORT port-number] [ENABLED | DISABLED]
```

network-interface-name

The name you assign to the network interface, where *network-interface-name* conforms to conventions described in [Identifiers](#).

node-name

The name of the node.

node-IP-address

The node's IP address, either a public or private IP address. For more information, see [Using Public and Private IP Networks](#).

PORT *port-number*

Sets the port number for the network interface. You must supply a network interface when altering the port number.

[ENABLED | DISABLED]

Enables or disables the network interface.

Privileges

Superuser

Examples

Create a network interface:

```
=> CREATE NETWORK INTERFACE mynetwork ON v_vmart_node0001 WITH '123.4.5.6' PORT 456 ENABLED;
```

CREATE NOTIFIER

Creates a push-based notifier to send event notifications and messages out of Vertica.

Syntax

```
CREATE NOTIFIER [ IF NOT EXISTS ] notifier-name ACTION 'notifier-type'  
  [ ENABLE | DISABLE ]  
  [ MAXPAYLOAD 'integer{K|M}' ]  
  MAXMEMORYSIZE 'integer{K|M|G|T}'  
  [ TLS CONFIGURATION tls-configuration ]  
  [ TLSMODE 'tls-mode' ]  
  [ CA BUNDLE bundle-name [ CERTIFICATE certificate-name ] ]  
  [ IDENTIFIED BY 'uuid' ]  
  [ [NO] CHECK COMMITTED ]  
  [ PARAMETERS 'adapter-params' ]
```

Parameters

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

notifier-name

This notifier's unique identifier.

ACTION '*notifier-type*'

String, the type of notifier, one of the following:

- URL, with the following format, that identifies one or more target Kafka servers:

```
kafka://kafka-server-ip-address:port-number
```

To enable failover when a Kafka server is unavailable, specify additional hosts in a comma-delimited list. For example:

```
kafka://192.0.2.0:9092,192.0.2.1:9092,192.0.2.2:9092
```

- **syslog** : Notifications are sent to [syslog](#). To use notifiers of this type, you must set the **SyslogEnabled** parameter:

```
=> ALTER DATABASE DEFAULT SET SyslogEnabled = 1
```

Events monitored by this notifier type are not logged to [MONITORING_EVENTS](#) nor [vertica.log](#).

- **sns** : Notifications are sent to a [Simple Notification Service \(SNS\) endpoint](#).

ENABLE | DISABLE

Specifies whether to enable or disable the notifier.

Default: **ENABLE**.

MAXPAYLOAD '*integer*{K|M}'

The maximum size of the message, up to 10⁹ bytes, specified in kilobytes or megabytes.

The following restrictions apply:

- **MAXPAYLOAD** cannot be greater than **MAXMEMORYSIZE** .
- If you configure syslog to send messages to a remote destination, ensure that **MaxMessageSize** (in `/etc/rsyslog` for `rsyslog`) is greater than or equal to **MAXPAYLOAD** .
- The **MAXPAYLOAD** for SNS notifiers cannot exceed 256KB.

Defaults:

- Kafka: 1M
- syslog: 1M
- SNS: 256K

MAXMEMORYSIZE ' *integer* {K|M|G|T} '

The maximum size of the internal notifier, up to 2 TB, specified in kilobytes, megabytes, gigabytes, or terabytes.

MAXMEMORYSIZE must be greater than **MAXPAYLOAD** .

If the size of the message queue exceeds **MAXMEMORYSIZE** , the notifier drops excess messages.

TLS CONFIGURATION *tls-configuration*

The [TLS CONFIGURATION](#) to use for TLS.

Notifiers support the following TLS modes:

- DISABLE
- TRY_VERIFY (behaves like VERIFY_CA)
- VERIFY_CA
- VERIFY_FULL

If the notifier **ACTION** is 'syslog' or 'sns' , this parameter has no effect.

To encrypt messages sent to syslog, you must configure syslog for TLS.

To encrypt messages sent to an SNS endpoint, you must set the following configuration parameters:

- SNSCAFile or AWSCAFile
- SNSCAPath or AWSCAPath
- SNSEnableHttps

TLSMODE ' *tls-mode* '

Deprecated

This parameter has been superseded by the [TLS CONFIGURATION](#) parameter. If you use this parameter while the [TLS CONFIGURATION](#) parameter is not set, Vertica automatically creates a new TLS Configuration for the notifier uses the same values as the deprecated parameter.

Specifies the type of connection between the notifier and an endpoint, one of the following:

- **disable** (default): Plaintext connection.
- **verify-ca** : Encrypted connection, and the server's certificate is verified as being signed by a trusted CA.

If you set this parameter to **verify-ca** , the generated TLS Configuration will be set to TRY_VERIFY, which has the same behavior as VERIFY_CA.

If the notifier **ACTION** is 'syslog' or 'sns' , this parameter has no effect.

To encrypt messages sent to syslog, you must configure syslog for TLS.

To encrypt messages sent to an SNS endpoint, you must set the following configuration parameters:

- SNSCAFile or AWSCAFile
- SNSCAPath or AWSCAPath
- SNSEnableHttps

CA BUNDLE *bundle-name*

Deprecated

This parameter has been superseded by the TLS CONFIGURATION parameter. If you use this parameter while the TLS CONFIGURATION parameter is not set, Vertica automatically creates a new TLS Configuration for the notifier uses the same values as the deprecated parameter.

Specifies a [CA bundle](#). The certificates inside the bundle are used to validate the Kafka server's certificate if the **TLSMODE** requires it. If a CA bundle is specified for a notifier that currently uses **disable**, which doesn't validate the Kafka server's certificate, the bundle will go unused when connecting to the Kafka server. This behavior persists unless the **TLSMODE** is changed to one that validates server certificates.

Changes to contents of the CA bundle take effect either after the notifier is disabled and re-enabled or after the database restarts. However, changes to which CA bundle the notifier uses takes effect immediately.

If the notifier **ACTION** is 'syslog' or 'sns', this parameter has no effect.

To encrypt messages sent to syslog, you must configure syslog for TLS.

To encrypt messages sent to an SNS endpoint, you must set the following configuration parameters:

- SNSCAFile or AWSCAFile
- SNSCAPath or AWSCAPath
- SNSEnableHttps

CERTIFICATE *certificate-name*

Deprecated

This parameter has been superseded by the TLS CONFIGURATION parameter. If you use this parameter while the TLS CONFIGURATION parameter is not set, Vertica automatically creates a new TLS Configuration for the notifier uses the same values as the deprecated parameter.

Specifies a [client certificate](#) for validation by the endpoint.

If the notifier **ACTION** is 'syslog' or 'sns', this parameter has no effect.

To encrypt messages sent to syslog, you must configure syslog for TLS.

To encrypt messages sent to an SNS endpoint, you must set the following configuration parameters:

- SNSCAFile or AWSCAFile
- SNSCAPath or AWSCAPath
- SNSEnableHttps

IDENTIFIED BY *uuid*

Specifies the notifier's unique identifier. If set, all the messages published by this notifier have this attribute.

[NO] CHECK COMMITTED

Specifies to wait for delivery confirmation before sending the next message in the queue.

Some messaging systems, like syslog, do not support delivery confirmation.

For SNS notifiers, CHECK COMMITTED must be specified, and NO CHECK COMMITTED behaves like CHECK COMMITTED.

PARAMETERS ' *adapter-params* '

Specifies one or more optional adapter parameters that are passed as a string to the adapter. Adapter parameters apply only to the adapter associated with the notifier.

For Kafka notifiers, refer to [Kafka and Vertica configuration settings](#).

For syslog notifiers, specify the severity of the event with **eventSeverity= severity**, where **severity** is one of the following:

- **0** : Emergency
- **1** : Alert
- **2** : Critical
- **3** : Error
- **4** : Warning
- **5** : Notice
- **6** : Informational

- 7 : Debug

Most syslog implementations, by default, do not log events with a severity level of 7. You must configure syslog to record these types of events.

Parameters cannot be set for SNS notifiers.

Privileges

[Superuser](#)

Encrypted notifiers for SASL_SSL Kafka configurations

Follow this procedure to create or alter notifiers for Kafka endpoints that use SASL_SSL. Note that you must repeat this procedure whenever you change the TLSMODE, certificates, or CA bundle for a given notifier.

1. [Create a TLS Configuration](#) with the desired TLS mode, certificate, and CA certificates.
2. Use CREATE or ALTER to disable the notifier and set the TLS Configuration:

```
=> ALTER NOTIFIER encrypted_notifier
DISABLE
TLS CONFIGURATION kafka_tls_config;
```

3. ALTER the notifier and set the proper rdkafka adapter parameters for SASL_SSL:

```
=> ALTER NOTIFIER encrypted_notifier PARAMETERS
'sasl.username=user;sasl.password=password;sasl.mechanism=PLAIN;security.protocol=SASL_SSL';
```

4. Enable the notifier:

```
=> ALTER NOTIFIER encrypted_notifier ENABLE;
```

Examples

Kafka notifiers

Create a Kafka notifier:

```
=> CREATE NOTIFIER my_dc_notifier
ACTION 'kafka://172.16.20.10:9092'
MAXMEMORYSIZE '1G'
IDENTIFIED BY 'f8b0278a-3282-4e1a-9c86-e0f3f042a971'
NO CHECK COMMITTED;
```

Create a notifier with an adapter-specific parameter:

```
=> CREATE NOTIFIER my_notifier
ACTION 'kafka://127.0.0.1:9092'
MAXMEMORYSIZE '10M'
PARAMETERS 'queue.buffering.max.ms=1000';
```

Create a notifier that uses an encrypted connection and verifies the Kafka server's certificate with the CA certificates in the notifier_tls_config object:

```
=> CREATE NOTIFIER encrypted_notifier
ACTION 'kafka://127.0.0.1:9092'
MAXMEMORYSIZE '10M'
TLS CONFIGURATION 'notifier_tls_config'
```

Syslog notifiers

The following example creates a notifier that writes a message to syslog when the [Data collector](#) (DC) component [LoginFailures](#) updates:

1. Enable syslog notifiers for the current database:

```
=> ALTER DATABASE DEFAULT SET SyslogEnabled = 1;
```

2. Create and enable a syslog notifier [v_syslog_notifier](#) :

```
=> CREATE NOTIFIER v_syslog_notifier ACTION 'syslog'
ENABLE
MAXMEMORYSIZE '10M'
IDENTIFIED BY 'f8b0278a-3282-4e1a-9c86-e0f3f042a971'
PARAMETERS 'eventSeverity = 5';
```

3. Configure the syslog notifier [v_syslog_notifier](#) for updates to the [LoginFailures](#) DC component with [SET_DATA_COLLECTOR_NOTIFY_POLICY](#) :

```
=> SELECT SET_DATA_COLLECTOR_NOTIFY_POLICY('LoginFailures',v_syslog_notifier, 'Login failed!', true);
```

This notifier writes the following message to syslog (default location: [/var/log/messages](#)) when a user fails to authenticate as the user **Bob** :

```
Apr 25 16:04:58
vertica_host_01
vertica:
  Event Posted:
    Event Code:21
    Event Id:0

```

For details on syslog notifiers, see [Configuring reporting for syslog](#).

See also

- [ALTER NOTIFIER](#)
- [DROP NOTIFIER](#)
- [Monitoring Vertica Using Notifiers](#)

CREATE PROCEDURE (external)

Enterprise Mode only

Adds an [external procedure](#) to Vertica. See [External procedures](#) for more information.

Syntax

```
CREATE PROCEDURE [ IF NOT EXISTS ]
  [[database.]schema.]procedure( [ argument-list ] )
  AS executable
  LANGUAGE 'EXTERNAL'
  USER OS-user
```

Parameters

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

This option cannot be used with **OR REPLACE** .

[*database* .] *schema*

Database and [schema](#). The default schema is **public** . If you specify a database, it must be the current database.

procedure

Specifies a name for the external procedure, where *procedure-name* conforms to conventions described in [Identifiers](#) .

argument-list

A comma-delimited list of procedure arguments, where each argument is specified as follows:

```
[ argname ] argtype
```

- *argname* optionally provides a descriptive name for this argument.
- *argtype* must be one of the following data types supported by Vertica:
 - BIGINT
 - BOOLEAN
 - DECIMAL
 - DOUBLE PRECISION
 - FLOAT
 - FLOAT8
 - INT
 - INT8
 - INTEGER
 - MONEY
 - NUMBER
 - NUMERIC
 - REAL
 - SMALLINT
 - TINYINT
 - VARCHAR

executable

The name of the executable program in the procedures directory, a string.

OS-user

The owner of the file, a string. The owner:

- Cannot be root
- Must have execute privileges on *executable*

Privileges

Superuser

System security

- The procedure file must be owned by the database administrator (OS account) or by a user in the same group as the administrator. The procedure file must also have the set UID attribute enabled, and allow read and execute permission for the group.
- External procedures that you create with [CREATE PROCEDURE \(external\)](#) are always run with Linux dbadmin privileges. If a dbadmin or pseudosuperuser grants a non-dbadmin permission to run a procedure using [GRANT \(procedure\)](#) , be aware that the non-dbadmin user runs the procedure with full Linux dbadmin privileges.

Examples

The following example shows how to create a procedure named **helloplanet** for the procedure file **helloplanet.sh** . This file accepts one VARCHAR argument.

Create the file:

```
#!/bin/bash
echo "hello planet argument: $1" >> /tmp/myprocedure.log
```

Create the procedure with the following SQL:

```
=> CREATE PROCEDURE helloplanet(arg1 varchar) AS 'helloplanet.sh' LANGUAGE 'external' USER 'dbadmin';
```

See also

- [DROP PROCEDURE \(external\)](#)
- [Installing external procedure executable files](#)

CREATE PROCEDURE (stored)

Creates a [stored procedure](#).

Syntax

```
CREATE [ OR REPLACE ] PROCEDURE [ IF NOT EXISTS ]
  {{{namespace. | database. }}schema.)procedure( [ parameter-list ] )
  [ LANGUAGE 'language-name' ]
  [ SECURITY { DEFINER | INVOKER } ]
  AS $$ source $$;
```

Parameters

OR REPLACE

If a procedure with the same name already exists, replace it. Users and roles with privileges on the original procedure retain these privileges on the new procedure.

This option cannot be used with **IF NOT EXISTS**.

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

This option cannot be used with **OR REPLACE**.

{ **namespace.** | **database.** }

Name of the database or [namespace](#) that contains *table*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be **default_namespace**.
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default **public**. If you specify the namespace or database name, you must provide the schema name, even if the schema is **public**.

procedure

The name of the stored procedure, where ***procedure-name*** conforms to conventions described in [Identifiers](#).

parameter-list

A comma-delimited list of formal parameters, each specified as follows:

```
[ parameter-mode ] parameter-name parameter-type
```

- **parameter-name**: the name of the parameter.
- **parameter-type**: Any [SQL data type](#), with the following exceptions:
 - DECIMAL
 - NUMERIC
 - NUMBER
 - MONEY
 - UUID
 - GEOGRAPHY
 - GEOMETRY
 - Complex types

language-name

Specifies the language of the procedure *source*, one of the following (both options refer to [PLvSQL](#); PLpgSQL is included to maintain compatibility with existing scripts):

- PLvSQL
- PLpgSQL

Default: **PLvSQL**

SECURITY { DEFINER | INVOKER }

Determines whose privileges to use when the procedure is called and executes it as if the user is one of the following:

- DEFINER: User who defined the procedure
- INVOKER: User who [called](#) the procedure

A procedure with SECURITY DEFINER effectively executes the procedure as that user, so changes to the database appear to be performed by the procedure's definer rather than its caller.

Caution

Improper use of SECURITY DEFINER can lead to the [confused deputy problem](#) and introduce vulnerabilities into your system like SQL injection.

For more information, see [Executing stored procedures](#).

source

The procedure source code. For details, see [Scope and structure](#).

Privileges

Non-superuser: CREATE on the procedure's schema

Examples

For more complex examples, see [Stored procedures: use cases and examples](#)

The following procedure echoes its inputs as a result set:

```
=> CREATE PROCEDURE echo_int_varchar(INOUT x INT, INOUT y VARCHAR) LANGUAGE PLvSQL AS $$
BEGIN
    RAISE NOTICE 'This procedure outputs a result set of its inputs:';
END
$$;

=> CALL echo_int_varchar(3, 'a string');
NOTICE 2005: This procedure outputs a result set of its inputs:
 x | y
---+---
 3 | a string
(1 row)
```

The example uses a set of procedures that convert a given Fahrenheit temperature to Celsius and Kelvin and returns them all as a result set. The procedure `f_to_c_and_k()` calls the helper procedures `f_to_c()` and `f_to_k()` to convert to Celsius and Kelvin, respectively. The `f_to_k()` procedure uses the output of `f_to_c()` for part of the conversion:

```

=> CREATE PROCEDURE f_to_c_and_k(IN f_temp DOUBLE PRECISION, OUT c_temp DOUBLE PRECISION, OUT k_temp DOUBLE PRECISION) AS $$
BEGIN
    c_temp := CALL f_to_c(f_temp);
    k_temp := CALL f_to_k(f_temp);
END;
$$;

=> CREATE PROCEDURE f_to_c(INOUT temp DOUBLE PRECISION) AS $$
BEGIN
    temp := (temp - 32) * 5/9;
END;
$$;

=> CREATE PROCEDURE f_to_k(INOUT temp DOUBLE PRECISION) AS $$
BEGIN
    temp := CALL f_to_c(temp);
    temp := temp + 273.15;
END;
$$;

=> CALL f_to_c_and_k(80);
   c_temp   |   k_temp
-----+-----
26.666666666666667 | 299.8166666666667
(1 row)

```

See also

- [PL/SQL](#)
- [CALL](#)
- [DO](#)
- [DROP PROCEDURE \(stored\)](#)

CREATE PROFILE

Creates a [profile](#) that controls password requirements for users.

Syntax

```

CREATE PROFILE profile-name LIMIT [
    PASSWORD_LIFE_TIME setting
    PASSWORD_MIN_LIFE_TIME setting
    PASSWORD_GRACE_TIME setting
    FAILED_LOGIN_ATTEMPTS setting
    PASSWORD_LOCK_TIME setting
    PASSWORD_REUSE_MAX setting
    PASSWORD_REUSE_TIME setting
    PASSWORD_MAX_LENGTH setting
    PASSWORD_MIN_LENGTH setting
    PASSWORD_MIN_LETTERS setting
    PASSWORD_MIN_UPPERCASE_LETTERS setting
    PASSWORD_MIN_LOWERCASE_LETTERS setting
    PASSWORD_MIN_DIGITS setting
    PASSWORD_MIN_SYMBOLS setting
    PASSWORD_MIN_CHAR_CHANGE setting ]

```

Parameters

Note

All parameters that are not explicitly set in a new profile are set to **default** , and inherit their settings from the default profile.

Name	Description
<i>name</i>	<p>The name of the profile to create, where * <i>name</i> *conforms to conventions described in Identifiers.</p> <p>To modify the default profile, set <i>name</i> to <i>default</i> . For example:</p> <pre>ALTER PROFILE DEFAULT LIMIT PASSWORD_MIN_SYMBOLS 1;</pre>
PASSWORD_LIFE_TIME	<p>Set to an integer value, one of the following:</p> <ul style="list-style-type: none"> • ≥ 1: The number of days a password remains valid. • UNLIMITED : Password remains valid indefinitely. <p>After your password's lifetime and grace period expire, you must change your password on your next login, if you have not done so already.</p>
PASSWORD_MIN_LIFE_TIME	<p>Set to an integer value, one of the following:</p> <ul style="list-style-type: none"> • Default: 0 • ≥ 1: The number of days a password must be set before it can be changed • UNLIMITED : Password can be reset at any time.
PASSWORD_GRACE_TIME	<p>Set to an integer value, one of the following:</p> <ul style="list-style-type: none"> • ≥ 1: The number of days a password can be used after it expires. • UNLIMITED : No grace period.
FAILED_LOGIN_ATTEMPTS	<p>Set to an integer value, one of the following:</p> <ul style="list-style-type: none"> • ≥ 1: The number of consecutive failed login attempts Vertica allows before locking your account. • UNLIMITED : Vertica allows an unlimited number of failed login attempts.
PASSWORD_LOCK_TIME	<ul style="list-style-type: none"> • ≥ 1: The number of days (units configurable with PasswordLockTimeUnit) a user's account is locked after FAILED_LOGIN_ATTEMPTS number of login attempts. The account is automatically unlocked when the lock time elapses. • UNLIMITED : Account remains indefinitely inaccessible until a superuser manually unlocks it.
PASSWORD_REUSE_MAX	<p>Set to an integer value, one of the following:</p> <ul style="list-style-type: none"> • ≥ 1: The number of times you must change your password before you can reuse an earlier password. • UNLIMITED : You can reuse an earlier password without any intervening changes.
PASSWORD_REUSE_TIME	<p>Set to an integer value, one of the following:</p> <ul style="list-style-type: none"> • ≥ 1: The number of days that must pass after a password is set before you can reuse it. • UNLIMITED : You can reuse an earlier password immediately.
PASSWORD_MAX_LENGTH	<p>The maximum number of characters allowed in a password, one of the following:</p> <ul style="list-style-type: none"> • Integer between 8 and 512, inclusive

<code>PASSWORD_MIN_LENGTH</code>	The minimum number of characters required in a password, one of the following: <ul style="list-style-type: none"> • 0 to <code>PASSWORD_MAX_LENGTH</code> • <code>UNLIMITED</code> : Minimum of <code>PASSWORD_MAX_LENGTH</code>
<code>PASSWORD_MIN_LETTERS</code>	Minimum number of letters (a-z and A-Z) that must be in a password, one of the following: <ul style="list-style-type: none"> • Integer between 0 and <code>PASSWORD_MAX_LENGTH</code> , inclusive • <code>UNLIMITED</code> : 0 (no minimum)
<code>PASSWORD_MIN_UPPERCASE_LETTERS</code>	Minimum number of uppercase letters (A-Z) that must be in a password, one of the following: <ul style="list-style-type: none"> • Integer between 0 and <code>PASSWORD_MAX_LENGTH</code> , inclusive • <code>UNLIMITED</code> : 0 (no minimum)
<code>PASSWORD_MIN_LOWERCASE_LETTERS</code>	Minimum number of lowercase letters (a-z) that must be in a password, one of the following: <ul style="list-style-type: none"> • Integer between 0 and <code>PASSWORD_MAX_LENGTH</code> , inclusive • <code>UNLIMITED</code> : 0 (no minimum)
<code>PASSWORD_MIN_DIGITS</code>	Minimum number of digits (0-9) that must be in a password, one of the following: <ul style="list-style-type: none"> • Integer between 0 and <code>PASSWORD_MAX_LENGTH</code> , inclusive • <code>UNLIMITED</code> : 0 (no minimum)
<code>PASSWORD_MIN_SYMBOLS</code>	Minimum number of symbols—printable non-letter and non-digit characters such as \$, #, @—that must be in a password, one of the following: <ul style="list-style-type: none"> • Integer between 0 and <code>PASSWORD_MAX_LENGTH</code> , inclusive • <code>UNLIMITED</code> : 0 (no minimum)
<code>PASSWORD_MIN_CHAR_CHANGE</code>	Minimum number of characters that must be different from the previous password: <ul style="list-style-type: none"> • Default: 0 • Integer between 0 and <code>PASSWORD_MAX_LENGTH</code> , inclusive • <code>UNLIMITED</code> : 0 (no minimum)

Privileges

Superuser

Profile settings and client authentication

The following profile settings affect [client authentication methods](#), such as LDAP or GSS:

- `FAILED_LOGIN_ATTEMPTS`
- `PASSWORD_LOCK_TIME`

All other profile settings are used only by Vertica to manage its passwords.

Examples

```
=> CREATE PROFILE sample_profile LIMIT PASSWORD_MAX_LENGTH 20;
```

See also

- [ALTER PROFILE](#)
- [DROP PROFILE](#)
- [Creating a database name and password](#)
- [Profiles](#)

CREATE PROJECTION

Creates metadata for a [projection](#) in the Vertica catalog. Vertica supports four types of projections:

- [Standard projection](#): Stores a collection of table data in a format that optimizes execution of certain queries on that table.
- [Live aggregate projection](#): Stores the grouped results of queries that invoke aggregate functions (such as SUM) on table columns.
- [Top-K projection](#): Stores the top k rows from partitions of selected rows.
- [UDTF projection](#): Stores newly-loaded data after it is transformed and/or aggregated by user-defined transformation functions (UDTFs).

[Complex data types](#) have additional restrictions when used within a projection:

- Each projection must include at least one column that is a primitive type or native array.
- An AS SELECT clause can use a complex-type column, but any other expression must be of a scalar type or native array.
- The ORDER BY , PARTITION BY , and GROUP BY clauses cannot use complex types.
- If a projection does not include an ORDER BY or segmentation clause, Vertica uses only the primitive columns from the select list to order or segment data.
- Projection columns cannot be complex types returned from functions such as ARRAY_CAT .
- TopK and UDTF projections do not support complex types.

In this section

- [Encoding types](#)
- [GROUPED clause](#)
- [Hash segmentation clause](#)
- [Live aggregate projection](#)
- [Standard projection](#)
- [Top-k projection](#)
- [UDTF projection](#)
- [Unsegmented clause](#)

Encoding types

Vertica supports various encoding and compression types, specified by the following **ENCODING** parameter arguments:

- [AUTO \(default\)](#)
- [BLOCK_DICT](#)
- [BLOCKDICT_COMP](#)
- [BZIP_COMP](#)
- [COMMONDELTA_COMP](#)
- [DELTARANGE_COMP](#)
- [DELTAVAL](#)
- [GCDDELTA](#)
- [GZIP_COMP](#)
- [RLE](#)
- [Zstandard Compression](#)

Note

Vertica supports the following encoding for [numeric data types](#):

- Precision ≤ 18 : [AUTO](#) , [BLOCK_DICT](#) , [BLOCKDICT_COMP](#) , [COMMONDELTA_COMP](#) , [DELTAVAL](#) , [GCDDELTA](#) , and [RLE](#)
- Precision > 18 : [AUTO](#) , [BLOCK_DICT](#) , [BLOCKDICT_COMP](#) , [RLE](#)

You can set encoding types on a projection column when you [create the projection](#) . You can also change the encoding of one or more projection columns for a given table with [ALTER TABLE...ALTER COLUMN](#) .

AUTO (default)

AUTO encoding is ideal for sorted, many-valued columns such as primary keys. It is also suitable for general purpose applications for which no other encoding or compression scheme is applicable. Therefore, it serves as the default if no encoding/compression is specified.

Column data type	Default encoding type
------------------	-----------------------

BINARY/VARBINARY BOOLEAN CHAR/VARCHAR FLOAT	Lempel-Ziv-Oberhumer-based (LZO) compression
DATE/TIME/TIMESTAMP INTEGER INTERVAL	Compression scheme based on the delta between consecutive column values.

The CPU requirements for this type are relatively small. In the worst case, data might expand by eight percent (8%) for LZO and twenty percent (20%) for integer data.

BLOCK_DICT

For each block of storage, Vertica compiles distinct column values into a dictionary and then stores the dictionary and a list of indexes to represent the data block.

BLOCK_DICT is ideal for few-valued, unsorted columns where saving space is more important than encoding speed. Certain kinds of data, such as stock prices, are typically few-valued within a localized area after the data is sorted, such as by stock symbol and timestamp, and are good candidates for BLOCK_DICT. By contrast, long CHAR/VARCHAR columns are not good candidates for BLOCK_DICT encoding.

CHAR and VARCHAR columns that contain 0x00 or 0xFF characters should not be encoded with BLOCK_DICT. Also, BINARY/VARBINARY columns do not support BLOCK_DICT encoding.

BLOCK_DICT encoding requires significantly higher CPU usage than default encoding schemes. The maximum data expansion is eight percent (8%).

BLOCKDICT_COMP

This encoding type is similar to BLOCK_DICT except dictionary indexes are entropy coded. This encoding type requires significantly more CPU time to encode and decode and has a poorer worst-case performance. However, if the distribution of values is extremely skewed, using [BLOCK_DICT_COMP](#) encoding can lead to space savings.

BZIP_COMP

BZIP_COMP encoding uses the bzip2 compression algorithm on the block contents. See [bzip](#) web site for more information. This algorithm results in higher compression than the automatic LZO and gzip encoding; however, it requires more CPU time to compress. This algorithm is best used on large string columns such as VARCHAR, VARBINARY, CHAR, and BINARY. Choose this encoding type when you are willing to trade slower load speeds for higher data compression.

COMMONDELTA_COMP

This compression scheme builds a dictionary of all deltas in the block and then stores indexes into the delta dictionary using entropy coding.

This scheme is ideal for sorted FLOAT and INTEGER-based (DATE/TIME/TIMESTAMP/INTERVAL) data columns with predictable sequences and only occasional sequence breaks, such as timestamps recorded at periodic intervals or primary keys. For example, the following sequence compresses well: 300, 600, 900, 1200, 1500, 600, 1200, 1800, 2400. The following sequence does not compress well: 1, 3, 6, 10, 15, 21, 28, 36, 45, 55.

If delta distribution is excellent, columns can be stored in less than one bit per row. However, this scheme is very CPU intensive. If you use this scheme on data with arbitrary deltas, it can cause significant data expansion.

DELTARANGE_COMP

This compression scheme is primarily used for floating-point data; it stores each value as a delta from the previous one.

This scheme is ideal for many-valued FLOAT columns that are sorted or confined to a range. Do not use this scheme for unsorted columns that contain NULL values, as the storage cost for representing a NULL value is high. This scheme has a high cost for both compression and decompression.

To determine if DELTARANGE_COMP is suitable for a particular set of data, compare it to other schemes. Be sure to use the same sort order as the projection, and select sample data that will be stored consecutively in the database.

DELTAVAL

For INTEGER and DATE/TIME/TIMESTAMP/INTERVAL columns, data is recorded as a difference from the smallest value in the data block. This encoding has no effect on other data types.

DELTAVAL is best used for many-valued, unsorted integer or integer-based columns. CPU requirements for this encoding type are minimal, and data never expands.

GCDELTA

For INTEGER and DATE/TIME/TIMESTAMP/INTERVAL columns, and NUMERIC columns with 18 or fewer digits, data is recorded as the difference from the smallest value in the data block divided by the greatest common divisor (GCD) of all entries in the block. This encoding has no effect on other data types.

ENCODING GCDELTA is best used for many-valued, unsorted, integer columns or integer-based columns, when the values are a multiple of a common factor. For example, timestamps are stored internally in microseconds, so data that is only precise to the millisecond are all multiples of 1000. The CPU requirements for decoding GCDELTA encoding are minimal, and the data never expands, but GCDELTA may take more encoding time than DELTAVAL.

GZIP_COMP

This encoding type uses the gzip compression algorithm. See [gzip](#) web site for more information. This algorithm results in better compression than the automatic LZO compression, but lower compression than BZIP_COMP. It requires more CPU time to compress than LZO but less CPU time than BZIP_COMP. This algorithm is best used on large string columns such as VARCHAR, VARBINARY, CHAR, and BINARY. Use this encoding when you want a better compression than LZO, but at less CPU time than bzip2.

RLE

RLE (run length encoding) replaces sequences (runs) of identical values with a single pair that contains the value and number of occurrences. Therefore, it is best used for low cardinality columns that are present in the ORDER BY clause of a projection.

The Vertica execution engine processes RLE encoding run-by-run and the Vertica optimizer gives it preference. Use it only when run length is large, such as when low-cardinality columns are sorted.

Zstandard compression

Vertica supports three [ZSTD](#) compression types:

- **ZSTD_COMP** provides high compression ratios. This encoding type has a higher compression than gzip. Use this when you want a better compression than gzip. For general use cases, use this or the **ZSTD_FAST_COMP** encoding type.
- **ZSTD_FAST_COMP** uses the fastest compression level that the zstd library provides. It is the fastest encoding type of the zstd library, but takes up more space than the other two encoding types. For general use cases, use this or the **ZSTD_COMP** encoding type.
- **ZSTD_HIGH_COMP** offers the best compression in the zstd library. It is slower than the other two encoding types. Use this type when you need the best compression, with slower CPU time.

GROUPED clause

Enterprise Mode only

Groups two or more columns into a single disk file. Doing so minimizes file I/O for the following tasks:

- Read a large percentage of the columns in a table.
- Perform single row look-ups.
- Query against many small columns.
- Frequently update data in these columns.

You can improve query performance by grouping columns that are always accessed together and are not used in predicates. Once columns are grouped, queries can no longer retrieve from disk records for one column independently of the others.

Note

RLE encoding is reduced when an RLE column is grouped with one or more non-RLE columns.

You can group columns in several ways:

- Group some of the columns:

```
(a, GROUPED(b, c), d)
```

- Group all of the columns:

```
(GROUPED(a, b, c, d))
```

- Create multiple groupings in the same projection:

```
(GROUPED(a, b), GROUPED(c, d))
```

Note

Vertica performs dynamic column grouping. For example, to provide better read and write efficiency for small loads, Vertica ignores any

projection-defined column grouping (or lack thereof) and groups all columns together by default.

Grouping columns

The following example shows how to group columns `bid` and `ask`. The `stock` column is stored separately.

```
=> CREATE TABLE trades (stock CHAR(5), bid INT, ask INT);
=> CREATE PROJECTION tradeproj (stock ENCODING RLE,
  GROUPED(bid ENCODING DELTAVAL, ask))
AS (SELECT * FROM trades) KSAFE 1;
```

The following example show how to create a projection that uses expressions in the column definition. The projection contains two integer columns `a` and `b`, and a third column `product_value` that stores the product of `a` and `b`:

```
=> CREATE TABLE values (a INT, b INT);
=> CREATE PROJECTION product (a, b, product_value) AS
SELECT a, b, a*b FROM values ORDER BY a KSAFE;
```

Hash segmentation clause

Specifies how to segment projection data for distribution across all cluster nodes. You can specify segmentation for a table and a projection. If a table definition specifies segmentation, Vertica uses it for that table's [auto-projections](#).

It is strongly recommended that you use Vertica's built-in [HASH](#) function, which distributes data evenly across the cluster, and facilitates optimal query execution.

Syntax

```
SEGMENTED BY expression ALL NODES [ OFFSET offset ]
```

Parameters

SEGMENTED BY *expression*

A general SQL expression. Hash segmentation is the preferred method of segmentation. Vertica recommends using its built-in [HASH](#) function, whose arguments resolve to table columns. If you use an expression other than [HASH](#), Vertica issues a warning.

The segmentation expression should specify columns with a large number of unique data values and acceptable skew in their data distribution. In general, primary key columns that meet these criteria are good candidates for hash segmentation.

For details, see [Expression Requirements](#) below.

ALL NODES

Automatically distributes data evenly across all nodes when the projection is created. Node ordering is fixed.

OFFSET *offset*

A zero-based offset that indicates on which node to start segmentation distribution.

This option is not valid for [CREATE TABLE](#) and [CREATE TEMPORARY TABLE](#).

Important

If you create a projection for a table with the **OFFSET** option, be sure to create enough copies of each projection segment to satisfy system K-safety; otherwise, Vertica regards the projection as unsafe and cannot use it to query the table.

You can ensure K-safety compliance when you create projections by combining **OFFSET** and [KSAFE](#) options in the [CREATE PROJECTION](#) statement. On executing this statement, Vertica automatically creates the necessary number of projection copies.

Expression requirements

A segmentation expression must specify table columns as they are defined in the source table. Projection column names are not supported.

The following restrictions apply to segmentation expressions:

- All leaf expressions must be constants or [column references](#) to a column in the [CREATE PROJECTION](#)'s **SELECT** list.
- The expression must return the same value over the life of the database.
- Aggregate functions are not allowed.
- The expression must return non-negative [INTEGER](#) values in the range $0 \leq x < 2^{63}$, and values are generally distributed uniformly over that range.

Note

If the expression produces a value outside the expected range—for example, a negative value—no error occurs, and the row is added to the projection's first segment.

Examples

The following **CREATE PROJECTION** statement creates projection `public.employee_dimension_super`. It specifies to include all columns in table `public.employee_dimension`. The hash segmentation clause invokes the Vertica **HASH** function to segment projection data on the column `employee_key`; it also includes the **ALL NODES** clause, which specifies to distribute projection data evenly across all nodes in the cluster:

```
=> CREATE PROJECTION public.employee_dimension_super
AS SELECT * FROM public.employee_dimension
ORDER BY employee_key
SEGMENTED BY hash(employee_key) ALL NODES;
```

Live aggregate projection

Stores the grouped results of queries that invoke aggregate functions (such as SUM) on table columns. For details, see [Live aggregate projections](#).

Vertica does not regard live aggregate projections as [superprojections](#), even those that include all table columns. For other requirements and restrictions, see [Creating live aggregate projections](#).

Syntax

```
CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
[ (
  { projection-column | grouped-clause
  [ ENCODING encoding-type ]
  [ ACCESSRANK integer ] }[,...]
) ]
AS SELECT { table-column | expr-with-table-columns }[,...] FROM [[database.]schema.]table [ [AS] alias]
GROUP BY column-expr[,...]
[ KSAFE [ k-num ] ]
```

Arguments

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

[database .] schema

[Schema](#) for this projection and its anchor table. The value must be the same for both. If you specify a database, it must be the current database.

projection

Name of the projection to create, which must conform to [Identifiers](#). It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

projection-column

The name of a projection column. The list of projection columns must match the SELECT list columns and expressions in number, type, and sequence.

If projection column names are omitted, Vertica uses the anchor table column names specified in the SELECT list.

grouped-clause

See [GROUPED clause](#).

ENCODING encoding-type

The column [encoding type](#), by default set to AUTO.

ACCESSRANK integer

Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see [Overriding Default Column Ranking](#).

AS SELECT

Specifies the table data to query:

```
{table-column | expr-with-table-columns } [ [AS] alias ] [,...]
```

You can optionally assign an alias to each column expression and reference that alias elsewhere in the SELECT statement.

If you specify projection column names, the two lists of projection columns and table columns/expressions must exactly match in number and order.

GROUP BY *column-expr* [,...]

One or more column expressions from the SELECT list. The first expression must be the first column expression in the SELECT list, the second expression must be the second column expression in the SELECT list, and so on.

Privileges

Non-superusers:

- Anchor table owner
- CREATE privilege on the schema

Examples

See [Live aggregate projection example](#).

Standard projection

Stores a collection of table data in a format that optimizes execution of certain queries on that table. For details, see [Projections](#).

Syntax

```
CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
[ (
  { projection-column | grouped-clause
  [ ENCODING encoding-type ]
  [ ACCESSRANK integer ] } [,... ]
) ]
AS SELECT { * | { MATCH_COLUMNS('pattern') | expression [ [AS] alias ] } [,... ] }
FROM [[database.]schema.]table [ [AS] alias ]
[ ORDER BY column [,... ] ]
[ SEGMENTED BY expression ALL NODES [ OFFSET offset ] | UNSEGMENTED ALL NODES ]
[ KSAFE [ k-num ] ]
[ ON PARTITION RANGE BETWEEN min-val AND max-val ] ]
```

Arguments

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

[*database.*] *schema*

[Schema](#) for this projection and its anchor table. The value must be the same for both. If you specify a database, it must be the current database.

projection

Name of the projection to create, which must conform to [Identifiers](#). It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

projection-column

The name of a projection column. The list of projection columns must match the SELECT list columns and expressions in number, type, and sequence.

If projection column names are omitted, Vertica uses the anchor table column names specified in the SELECT list.

grouped-clause

See [GROUPED clause](#).

ENCODING *encoding-type*

The column [encoding type](#), by default set to AUTO.

ACCESSRANK *integer*

Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see [Overriding Default Column Ranking](#).

AS SELECT

Columns or column expressions to select from the specified table:

- * (asterisk): Returns all columns in the queried tables.
- [MATCH_COLUMNS](#)(' *pattern* '): Returns the names of all columns in the queried anchor table that match *pattern*.
- *expression* [[\[AS\] alias](#)]: Resolves to column data from the queried anchor table. You can optionally assign an alias to each column expression and reference that alias elsewhere in the SELECT statement—for example, in the ORDER BY or segmentation clause.

If you specify projection column names, the two lists of projection columns and table columns/expressions must exactly match in number and order.

ORDER BY *column*

Columns from the SELECT list on which to sort the projection. The [ORDER BY clause](#) can only be set to ASC (the default). Vertica always stores projection data in ascending sort order.

If you order by a column with a collection data type (ARRAY or SET), queries that use that column in an ORDER BY clause perform the sort again. This is because projections and queries perform the ordering differently.

If you omit the ORDER BY clause, Vertica uses the SELECT list to sort the projection.

SEGMENTED BY *expression* ALL NODES [OFFSET *offset*] | UNSEGMENTED ALL NODES

How to distribute projection data:

- [Hash-segmentation using an expression](#): segment projection data evenly and distribute across cluster nodes.
- [Unsegmented](#)

If neither the anchor table nor the projection specifies segmentation, Vertica uses hash segmentation using all columns:

```
SEGMENTED BY HASH(column[,...]) ALL NODES OFFSET 0;
```

Tip

Vertica recommends segmenting large tables.

KSAFE *k-num*

Specifies K-safety for the projection. The value must be equal to or greater than database K-safety. Vertica ignores this option if set for unsegmented projections.

If you omit this clause, Vertica uses database K-safety.

For general information, see [K-safety in an Enterprise Mode database](#).

ON PARTITION RANGE BETWEEN *min-val* AND *max-val*

Limits projection data to a range of partition keys. The minimum value must be less than or equal to the maximum value.

Values can be NULL. A null minimum value indicates no lower bound and a null maximum value indicates no upper bound. If both are NULL, this statement drops the projection endpoints, producing a regular projection instead of a range projection.

For other requirements and usage details, see [Partition range projections](#).

Privileges

Non-superusers:

- Anchor table owner
- CREATE privilege on the schema

Examples

See:

- [Segmented projections](#)
- [Unsegmented projections](#)
- [Partition range projections](#)

Top-k projection

Stores the top k rows from partitions of selected rows. For details, see [Top-k projections](#).

Vertica does not regard Top-K projections as [superprojections](#), even those that include all table columns. For other requirements and restrictions, see [Creating top-k projections](#).

Syntax

```
CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
[ (
  { projection-column | grouped-clause
  [ ENCODING encoding-type ]
  [ ACCESSRANK integer ] },... ]
) ]
AS SELECT { table-column | expr-with-table-columns },... FROM [[database.]schema.]table [ [AS] alias ]
LIMIT num-rows OVER ( window-partition-clause window-order-clause )
[ KSAFE [ k-num ] ]
```

Arguments

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

[*database* .] *schema*

[Schema](#) for this projection and its anchor table. The value must be the same for both. If you specify a database, it must be the current database.

projection

Name of the projection to create, which must conform to [Identifiers](#). It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

projection-column

The name of a projection column. The list of projection columns must match the SELECT list columns and expressions in number, type, and sequence.

If projection column names are omitted, Vertica uses the anchor table column names specified in the SELECT list.

grouped-clause

See [GROUPED clause](#).

ENCODING *encoding-type*

The column [encoding type](#), by default set to AUTO.

ACCESSRANK *integer*

Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see [Overriding Default Column Ranking](#).

AS SELECT

Specifies the table data to query:

```
{table-column | expr-with-table-columns } [ [AS] alias ] [,...]
```

You can optionally assign an alias to each column expression and reference that alias elsewhere in the SELECT statement.

If you specify projection column names, the two lists of projection columns and table columns/expressions must exactly match in number and order.

LIMIT *num-rows*

The number of rows to return from the specified partition.

OVER (*window-partition-clause window-order-clause*)

Specifies window partitioning by one or more comma-delimited column expressions from the SELECT list. The first partition expression must be the first SELECT list item, the second partition expression the second SELECT list item, and so on.

The order clause is required, and specifies the order in which the top *k* rows are returned. The default is ascending (ASC) order. All column expressions must be from the SELECT list, where the first window order expression must be the first SELECT list item not specified in the window partition clause.

Top-K projections support [ORDER BY NULLS FIRST/LAST](#).

Privileges

Non-superusers:

- Anchor table owner
- CREATE privilege on the schema

Examples

See [Top-k projection examples](#).

UDTF projection

Stores newly-loaded data after it is transformed and/or aggregated by user-defined transformation functions (UDTFs). For details and examples, see [Pre-aggregating UDTF results](#).

Important

Currently, projections can only reference [UDTFs developed in C++](#).

Syntax

```
CREATE PROJECTION [ IF NOT EXISTS ] [[database.]schema.]projection
```

```
[ (  
  { projection-column | grouped-clause  
  [ ENCODING encoding-type ]  
  [ ACCESSRANK integer ] } [,...]  
) ]
```

```
AS { batch-query FROM { prepass-query sq-ref | table [[AS] alias ]  
  | prepass-query }
```

batch-query:

```
SELECT { table-column | expr-with-table-columns } [,...], batch-udtf(batch-args)  
  OVER (PARTITION BATCH BY partition-column-expr [,...])  
  [ AS (output-columns) ]
```

prepass-query:

```
SELECT { table-column | expr-with-table-columns } [,...], prepass-udtf(prepass-args)  
  OVER (PARTITION PREPASS BY partition-column-expr [,...])  
  [ AS (output-columns) ] FROM table
```

Arguments

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

[*database* .] *schema*

[Schema](#) for this projection and its anchor table. The value must be the same for both. If you specify a database, it must be the current database.

projection

Name of the projection to create, which must conform to [Identifiers](#). It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

projection-column

The name of a projection column. The list of projection columns must match the SELECT list columns and expressions in number, type, and sequence.

If projection column names are omitted, Vertica uses the anchor table column names specified in the SELECT list.

grouped-clause

See [GROUPED clause](#).

ENCODING *encoding-type*

The column [encoding type](#), by default set to AUTO.

ACCESSRANK *integer*

Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see [Overriding Default Column Ranking](#).

SELECT

Specifies the table data to query:

```
{table-column | expr-with-table-columns } [ [AS] alias ] [,...]
```

You can optionally assign an alias to each column expression and reference that alias elsewhere in the SELECT statement.

If you specify projection column names, the two lists of projection columns and table columns/expressions must exactly match in number and order.

batch-udtf (*batch-args*)

The [batch UDTF](#) to invoke each time the following events occur:

- Tuple mover mergeout
- Queries on the projection
- If invoked singly, on data load operations

Important

If the projection definition includes a pre-pass subquery, *batch-args* must exactly match the pre-pass UDTF output columns, in name and order.

prepass-udtf (*prepass-args*)

The [pre-pass UDTF](#) to invoke on each load operation such as COPY or INSERT.

If specified in a subquery, the pre-pass UDTF returns transformed data to the batch query for further processing. Otherwise, the pre-pass query results are added to projection data storage.

OVER (PARTITION { BATCH | PREPASS } BY *partition-column-expr* [,...])

Specifies the UDTF type and how to partition the data it returns:

- **BATCH** identifies the UDTF as a [batch UDTF](#).
- **PREPASS** identifies the UDTF as a [pre-pass UDTF](#).

In both cases, the OVER clause specifies partitioning with one or more column expressions from the SELECT list. The first expression is the first column expression in the SELECT list, the second expression is the second column expression in the SELECT list, and so on.

Note

The projection is implicitly segmented and ordered on PARTITION BY columns.

AS *output-columns*

Optionally names columns that are returned by the UDTF.

If a pre-pass subquery omits this clause, the outer batch query UDTF arguments (*batch-args*) must reference the column names as they are defined in the pre-pass UDTF.

table **[[AS] alias]**

The projection's anchor table, optionally qualified by an alias.

sq-results

Subquery result set that is returned to the outer batch UDTF.

Privileges

Non-superusers:

- Anchor table owner
- CREATE privilege on the schema
- EXECUTE privileges on all UDTFs that are referenced by the projection

Examples

See [Pre-aggregating UDTF results](#).

Unsegmented clause

Specifies to distribute identical copies of table or projection data on all nodes across the cluster. Use this clause to facilitate distributed query execution on tables and projections that are too small to benefit from segmentation.

Vertica uses the same name to identify all instances of an unsegmented projection. For more information about projection name conventions, see [Projection naming](#).

Syntax

```
UNSEGMENTED ALL NODES
```

Examples

This example creates an unsegmented projection for table `store.store_dimension` :

```
=> CREATE PROJECTION store.store_dimension_proj (storekey, name, city, state)
      AS SELECT store_key, store_name, store_city, store_state
      FROM store.store_dimension
      UNSEGMENTED ALL NODES;
CREATE PROJECTION
```

```
=> SELECT anchor_table_name anchor_table, projection_name, node_name
      FROM PROJECTIONS WHERE projection_basename='store_dimension_proj';
anchor_table | projection_name | node_name
```

```
-----+-----+-----
store_dimension | store_dimension_proj | v_vmart_node0001
store_dimension | store_dimension_proj | v_vmart_node0002
store_dimension | store_dimension_proj | v_vmart_node0003
(3 rows)
```

CREATE RESOURCE POOL

Creates a user-defined resource pool.

Syntax

```
CREATE RESOURCE POOL pool-name [ FOR subcluster ] [ parameter-name setting ]...
```

Arguments

pool-name

Name of the resource pool. If you specify a resource pool name with uppercase letters, Vertica converts them to lowercase letters.

The following naming requirements apply:

- [Built-in pool](#) names cannot be used for user-defined pools.

- All user-defined global resource pools must have unique names.
- Names of global and subcluster-assigned resource pools cannot be the same. However, the same name can be shared by resource pools of different subclusters.

FOR *subcluster*

Eon Mode only, the subcluster to associate with this resource pool, where *subcluster* is one of the following:

- **SUBCLUSTER *subcluster-name*** : Resource pool for an existing subcluster. You cannot be connected to this subcluster, otherwise Vertica returns an error.
- **CURRENT SUBCLUSTER** : Resource pool for the subcluster that you are connected to.

If omitted, the resource pool is created globally.

parameter-name setting

A resource pool parameter and its initial value. If you omit this argument, Vertica sets this resource pool's parameters to their default values (see [Parameters](#)).

Parameters

Default values specified here pertain only to user-defined resource pools. For built-in pool default values, see [Built-in resource pools configuration](#) , or query system table [RESOURCE_POOL_DEFAULTS](#) .

CASCADE TO

Secondary resource pool for executing queries that exceed the [RUNTIMECAP](#) setting of their assigned resource pool:

```
CASCADE TO secondary-pool
```

CPUAFFINITYMODE

Specifies whether the resource pool has exclusive or shared use of the CPUs specified in [CPUAFFINITYSET](#) :

```
CPUAFFINITYMODE { SHARED | EXCLUSIVE | ANY }
```

- **SHARED** : Queries that run in this resource pool share its [CPUAFFINITYSET](#) CPUs with other Vertica resource pools.
- **EXCLUSIVE** : Dedicates [CPUAFFINITYSET](#) CPUs to this resource pool only, and excludes other Vertica resource pools. If [CPUAFFINITYSET](#) is set as a percentage, then that percentage of CPU resources available to Vertica is assigned solely for this resource pool.
- **ANY** : Queries in this resource pool can run on any CPU, invalid if [CPUAFFINITYSET](#) designates CPU resources.

Default : **ANY**

CPUAFFINITYSET

CPUs available to this resource pool. All cluster nodes must have the same number of CPUs. The CPU resources assigned to this set are unavailable to general resource pools.

```
CPUAFFINITYSET {
| cpu-index[,...]
| cpu-indexi-cpu-indexn
| integer%
| NONE
}
```

- *cpu-index* [...] : Dedicates one or more comma-delimited CPUs to this resource pool.
- *cpu-indexi-cpu-indexn* : Dedicates a range of contiguous CPU indexes *i* through *n* to this resource pool.
- *integer%* : Percentage of all available CPUs to use for this resource pool. Vertica rounds this percentage down to include whole CPU units.
- **NONE** (empty string): No affinity set is assigned to this resource pool. Queries associated with this pool are executed on any CPU.

Default : **NONE**

Important

[CPUAFFINITYSET](#) and [CPUAFFINITYMODE](#) must be set together in the same statement.

EXECUTIONPARALLELISM

Number of threads used to process any single query issued in this resource pool.

```
EXECUTIONPARALLELISM { limit | AUTO }
```

- **limit** : An integer value between 1 and the number of cores. Setting this parameter to a reduced value increases throughput of short queries issued in the resource pool, especially if queries are executed concurrently.
- **AUTO** or **0** : Vertica calculates the setting from the number of cores, available memory, and amount of data in the system. Unless memory is limited, or the amount of data is very small, Vertica sets this parameter to the number of cores on the node.

Default : **AUTO**

MAXCONCURRENCY

Maximum number of concurrent execution slots available to the resource pool across the cluster:

```
MAXCONCURRENCY { integer | NONE }
```

NONE (empty string): Unlimited number of concurrent execution slots.

Default : **NONE**

MAXMEMORYSIZE

Maximum size per node the resource pool can grow by borrowing memory from the [GENERAL](#) pool:

```
MAXMEMORYSIZE {
  'integer%'
  | 'integer{K|M|G|T}'
  NONE
}
```

- **integer%** : Percentage of total memory
- **integer{K|M|G|T}** : Amount of memory in kilobytes, megabytes, gigabytes, or terabytes
- **NONE** (empty string): Unlimited, resource pool can borrow any amount of available memory from the [GENERAL](#) pool.

Default : **NONE**

MAXQUERYMEMORYSIZE

Maximum amount of memory this resource pool can allocate at runtime to process a query. If the query requires more memory than this setting, Vertica stops execution and returns an error.

Set this parameter as follows:

```
MAXQUERYMEMORYSIZE {
  'integer%'
  | 'integer{K|M|G|T}'
  | NONE
}
```

- **integer%** : Percentage of [MAXMEMORYSIZE](#) for this resource pool.
- **integer{K|M|G|T}** : Amount of memory in kilobytes, megabytes, gigabytes, or terabytes, up to the value of [MAXMEMORYSIZE](#) .
- **NONE** (empty string): Unlimited; resource pool can borrow any amount of available memory from the [GENERAL](#) pool, within the limits set by [MAXMEMORYSIZE](#) .

Default : **NONE**

MEMORYSIZE

Total per-node memory available to the Vertica resource manager that is allocated to this resource pool:

```
MEMORYSIZE {
  'integer%'
  | 'integer{K|M|G|T}'
}
```

- **integer%** : Percentage of total memory
- **integer{K|M|G|T}** : Amount of memory in kilobytes, megabytes, gigabytes, or terabytes

Default: 0%. No memory allocated, the resource pool borrows memory from the [GENERAL](#) pool.

PLANNEDCONCURRENCY

Preferred number of queries to execute concurrently in the resource pool. This setting applies to the entire cluster:

```
PLANNEDCONCURRENCY { num-queries | AUTO }
```

- **num-queries**: Integer value ≥ 1 , the preferred number of queries to execute concurrently in the resource pool. When possible, query resource budgets are limited to allow this level of concurrent execution.
- **AUTO**: Value is calculated automatically at query runtime. Vertica sets this parameter to the lower of these two calculations, but never less than 4:
 - Number of logical cores
 - Memory divided by 2GB

If the number of logical cores on each node is different, **AUTO** is calculated differently for each node. Distributed queries run like the minimal effective planned concurrency. Single node queries run with the planned concurrency of the initiator.

Default : **AUTO**

Tip

Change this parameter only after evaluating performance over a period of time.

PRIORITY

Priority of queries in this resource pool when they compete for resources in the [GENERAL](#) pool:

```
PRIORITY { integer | HOLD }
```

- **integer**: Negative or positive integer value, where higher numbers denote higher priority:
 - User-defined resource pool: **-100** to **100**
 - Built-in resource pools [SYSQUERY](#), [RECOVERY](#), and [TM](#): **-110** to **110**
- **HOLD**: Sets priority to **-999**. Queries in this resource pool are queued until [QUEUETIMEOUT](#) is reached.

Default : 0

QUEUETIMEOUT

Maximum time a request can wait for pool resources before it is rejected, not more than one year:

```
QUEUETIMEOUT { integer | interval | 'NONE' }
```

- **integer**: Maximum wait time in seconds
- **[interval]**([/sql-reference/language-elements/literals/datetime-literals/interval-literal.html](#)): Maximum wait time expressed in the following format:
`num year num months num [days] HH:MM:SS.ms`
- **NONE** (empty string): No maximum wait time, request can be queued indefinitely, up to one year.

If the value that you specify resolves to more than one year, Vertica returns with a warning and sets the parameter to 365 days:

```
=> ALTER RESOURCE POOL user_0 QUEUETIMEOUT '11 months 50 days 08:32';
WARNING 5693: Using 1 year for QUEUETIMEOUT
ALTER RESOURCE POOL
=> SELECT QUEUETIMEOUT FROM resource_pools WHERE name = 'user_0';
QUEUETIMEOUT
-----
365
(1 row)
```

Default : **00:05 (5 minutes)**

RUNTIMECAP

Maximum execution time allowed to queries in this resource pool, not more than one year, otherwise Vertica returns with an error. If a query exceeds this setting, it tries to cascade to a secondary pool:

```
RUNTIMECAP { interval | NONE }
```

- **interval**: Maximum wait time expressed in the following format:
`num year num month num [day] HH:MM:SS.ms`

- **NONE** (empty string): No maximum wait time, request can be queued indefinitely, up to one year.

If the user or session also has a **RUNTIMECAP**, the shorter limit applies.

RUNTIMEPRIORITY

Determines how the resource manager should prioritize dedication of run-time resources (CPU, I/O bandwidth) to queries already running in this resource pool:

```
RUNTIMEPRIORITY { HIGH | MEDIUM | LOW }
```

Default : **MEDIUM**

RUNTIMEPRIORITYTHRESHOLD

Maximum time (in seconds) in which query processing must complete before the resource manager assigns to it the resource pool's **RUNTIMEPRIORITY**. All queries begin execution with a priority of HIGH.

```
RUNTIMEPRIORITYTHRESHOLD seconds
```

Default : **2**

SINGLEINITIATOR

Set to false for backward compatibility. Do not change this setting.

Privileges

Superuser

Examples

This example shows how to create a resource pool with **MEMORYSIZE** of 1800 MB.

```
=> CREATE RESOURCE POOL ceo_pool MEMORYSIZE '1800M' PRIORITY 10;
CREATE RESOURCE POOL
```

Assuming the CEO report user already exists, associate this user with the preceding resource pool using **ALTER USER** statement.

```
=> GRANT USAGE ON RESOURCE POOL ceo_pool to ceo_user;
GRANT PRIVILEGE
=> ALTER USER ceo_user RESOURCE POOL ceo_pool;
ALTER USER
```

Issue the following command to confirm that the ceo_user is associated with the ceo_pool:

```
=> SELECT * FROM users WHERE user_name = 'ceo_user';
-[ RECORD 1 ]-----+-----
user_id      | 45035996273733402
user_name    | ceo_user
is_super_user | f
profile_name | default
is_locked    | f
lock_time    |
resource_pool | ceo_pool
memory_cap_kb | unlimited
temp_space_cap_kb | unlimited
run_time_cap | unlimited
all_roles    |
default_roles |
search_path  | "$user", public, v_catalog, v_monitor, v_internal
```

This exampleshows how to create and designate secondary resource pools.

```
=> CREATE RESOURCE POOL rp3 RUNTIMECAP '5 minutes';
=> CREATE RESOURCE POOL rp2 RUNTIMECAP '3 minutes' CASCADE TO rp3;
=> CREATE RESOURCE POOL rp1 RUNTIMECAP '1 minute' CASCADE TO rp2;
=> SET SESSION RESOURCE_POOL = rp1;
```

This Eon Mode example confirms the current subcluster name, then creates a resource pool for the current subcluster:

```
=> SELECT CURRENT_SUBCLUSTER_NAME();
CURRENT_SUBCLUSTER_NAME
-----
analytics_1
(1 row)

=> CREATE RESOURCE POOL dashboard FOR SUBCLUSTER analytics_1;
CREATE RESOURCE POOL
```

In this section

- [Built-in pools](#)
- [Built-in resource pools configuration](#)

Built-in pools

Vertica is preconfigured with built-in pools for various system tasks:

- [GENERAL](#)
- [BLOBDATA](#)
- [DBD](#)
- [JVM](#)
- [METADATA](#)
- [RECOVERY](#)
- [REFRESH](#)
- [SYSQUERY](#)
- [TM](#)

For details on resource pool settings, see [ALTER RESOURCE POOL](#).

GENERAL

Catch-all pool used to answer requests that have no specific [resource pool](#) associated with them. Any memory left over after memory has been allocated to all other pools is automatically allocated to the GENERAL pool. The MEMORYSIZE parameter of the GENERAL pool is undefined (variable), however, the GENERAL pool must be at least 1GB in size and cannot be smaller than 25% of the memory in the system.

The MAXMEMORYSIZE parameter of the GENERAL pool has special meaning; when set as a % value it represents the percent of total physical RAM on the machine that the [Resource manager](#) can use for queries. By default, it is set to 95%. MAXMEMORYSIZE governs the total amount of RAM that the Resource Manager can use for queries, regardless of whether it is set to a percent or to a specific value (for example, '10GB').

User-defined pools can borrow memory from the GENERAL pool to satisfy requests that need extra memory until the MAXMEMORYSIZE parameter of that pool is reached. If the pool is configured to have MEMORYSIZE equal to MAXMEMORYSIZE, it cannot borrow any memory from the GENERAL pool. When multiple pools request memory from the GENERAL pool, they are granted access to general pool memory according to their priority setting. In this manner, the GENERAL pool provides some elasticity to account for point-in-time deviations from normal usage of individual resource pools.

Vertica recommends reducing the GENERAL pool MAXMEMORYSIZE if your catalog uses over 5 percent of overall memory. You can calculate what percentage of GENERAL pool memory the catalog uses as follows:

```
=> WITH memory_use_metadata AS (SELECT node_name, memory_size_kb FROM resource_pool_status WHERE pool_name='metadata'),
     memory_use_general AS (SELECT node_name, memory_size_kb FROM resource_pool_status WHERE pool_name='general')
SELECT m.node_name, ((m.memory_size_kb/g.memory_size_kb) * 100)::NUMERIC(4,2) pct_catalog_usage
FROM memory_use_metadata m JOIN memory_use_general g ON m.node_name = g.node_name;
 node_name | pct_catalog_usage
-----+-----
v_vmart_node0001 |      0.41
v_vmart_node0002 |      0.37
v_vmart_node0003 |      0.36
(3 rows)
```

BLOBDATA

Controls resource usage for in-memory blobs. *In-memory blobs* are objects used by a number of the machine learning SQL functions. You should adjust this pool if you plan on processing large machine learning workloads. For information about tuning the pool, see [Tuning for machine learning](#).

If a query using the BLOBDATA pool exceeds its query planning budget, then it spills to disk. For more information about tuning your query budget, see [Query budgeting](#).

DBD

Controls resource usage for [Database Designer](#) processing. Use of this pool is enabled by configuration parameter [DBDUseOnlyDesignerResourcePool](#), by default set to false.

By default, QUEUETIMEOUT is set to 0 for this pool. When resources are under pressure, this setting causes the DBD to time out immediately, and not be queued to run later. Database Designer then requests the user to run the designer later, when resources are more available.

Important

Do not change QUEUETIMEOUT or any DBD resource pool parameters.

JVM

Controls Java Virtual Machine resources used by Java User Defined Extensions. When a Java UDx starts the JVM, it draws resources from the those specified in the JVM resource pool. Vertica does not reserve memory in advance for the JVM pool. When needed, the pool can expand to 10% of physical memory or 2 GB of memory, whichever is smaller. If you are buffering large amounts of data, you may need to increase the size of the JVM resource pool.

You can adjust the size of your JVM resource pool by changing its configuration settings. Unlike other resource pools, the JVM resource pool does not release resources until a session is closed.

METADATA

Tracks memory allocated for catalog data and storage data structures. This pool increases in size as Vertica metadata consumes additional resources. Memory assigned to the METADATA pool is subtracted from the GENERAL pool, enabling the Vertica resource manager to make more effective use of available resources. If the METADATA resource pool reaches 75% of the GENERAL pool, Vertica stops updating METADATA memory size and displays a warning message in [vertica.log](#). You can enable or disable the METADATA pool with configuration parameter [EnableMetadataMemoryTracking](#).

If you created a "dummy" or "swap" resource pool to protect resources for use by your operating system, you can replace that pool with the METADATA pool.

Users cannot change the parameters of the METADATA resource pool.

RECOVERY

Used by queries issued when recovering another node of the database. The MAXCONCURRENCY parameter is used to determine how many concurrent recovery threads to use. You can use the PLANNEDCONCURRENCY parameter (by default, set to twice the **MAXCONCURRENCY**) to tune how to apportion memory to recovery queries.

See [Tuning for recovery](#).

REFRESH

Used by queries issued by [PROJECTION_REFRESHES](#) operations. [Refresh](#) does not currently use multiple concurrent threads; thus, changes to the MAXCONCURRENCY values have no effect.

See [Scenario: Tuning for Refresh](#).

SYSQUERY

Runs queries against all [system monitoring and catalog tables](#). The SYSQUERY pool reserves resources for system table queries so that they are never blocked by contention for available resources.

TM

The [Tuple Mover](#) (TM) pool. You can set the MAXCONCURRENCY parameter for the TM pool to allow concurrent TM operations.

See [Tuning tuple mover pool settings](#).

Built-in resource pools configuration

To view the current and default configuration for built-in resource pools, query the system tables RESOURCE_POOLS and RESOURCE_POOL_DEFAULTS, respectively. The sections below provide this information, and also indicate which built-in pool parameters can be modified with [ALTER RESOURCE POOL](#):

- [GENERAL](#)
- [BLOBDATA](#)
- [DBD](#)
- [JVM](#)
- [METADATA](#)
- [RECOVERY](#)
- [REFRESH](#)
- [SYSQUERY](#)
- [TM](#)

GENERAL

Important

Changes to GENERAL resource pool parameters take effect only when the database restarts.

Parameter	Settings
MEMORYSIZE	Empty / cannot be set
MAXMEMORYSIZE	<p>The maximum memory to use for all resource pools, one of the following:</p> <pre>MAXMEMORYSIZE { 'integer%' 'integer{K M G T}' }</pre> <ul style="list-style-type: none">• <i>integer%</i> : Percentage of total system RAM, must be $\geq 25\%$ <div style="background-color: #ffe6e6; padding: 10px;"><p>Caution Setting this parameter to 100% generates a warning of potential swapping.</p></div> <ul style="list-style-type: none">• <i>integer{K M G T}</i> : Amount of memory in kilobytes, megabytes, gigabytes, or terabytes, must be $\geq 1\text{GB}$ <p>For example, if your node has 64GB of memory, setting MAXMEMORYSIZE to 50% allocates half of available memory. Thus, the maximum amount of memory available to all resource pools is 32GB.</p> <p>Default: 95%</p>

MAXQUERYMEMORYSIZE	<p>The maximum amount of memory allocated by this pool to process any query:</p> <pre>MAXQUERYMEMORYSIZE { 'integer%' 'integer{K M G T}' }</pre> <ul style="list-style-type: none"> <i>integer%</i> : Percentage of MAXMEMORYSIZE for this pool. <i>integer{K M G T}</i> : Amount of memory in kilobytes, megabytes, gigabytes, or terabytes
EXECUTIONPARALLELISM	Default: AUTO
PRIORITY	Default: 0
RUNTIMEPRIORITY	Default: Medium
RUNTIMEPRIORITYTHRESHOLD	Default: 2
QUEUE_TIMEOUT	Default: 00:05 (minutes)
RUNTIMECAP	<p>Prevents runaway queries by setting the maximum time a query in the pool can execute. If a query exceeds this setting, it tries to cascade to a secondary pool:</p> <pre>RUNTIMECAP { 'interval' NONE }</pre> <ul style="list-style-type: none"> <i>interval</i> : An interval of 1 minute or 100 seconds; should not exceed one year. NONE (default): No time limit on queries running in this pool.
PLANNEDCONCURRENCY	<p>The number of concurrent queries you expect to run against the resource pool, an integer ≥ 4. If set to AUTO (default), Vertica automatically sets PLANNEDCONCURRENCY at query runtime, choosing the lower of these two values:</p> <ul style="list-style-type: none"> Number of cores Memory/2GB <p>Important In systems with a large number of cores, the default AUTO setting of PLANNEDCONCURRENCY is liable to be too low. In this case, set the parameter to the actual number of cores:</p> <pre>ALTER RESOURCE POOL general PLANNEDCONCURRENCY #cores ;</pre> <p>Default: AUTO</p>
MAXCONCURRENCY	<p>Caution Must be set ≥ 1, otherwise Vertica generates a warning that system queries might be unable to execute.</p> <p>Default: Empty</p>
SINGLEINITIATOR	<p>Important Included for backwards compatibility. Do not change.</p> <p>Default: False</p>

CASCADETO	Empty / cannot be set

CREATE ROLE

Creates a [role](#). After creating a role, use [GRANT statements](#) to specify role permissions.

Syntax

```
CREATE ROLE role
```

Parameters

role

The name for the new role, where *role* conforms to conventions described in [Identifiers](#).

Privileges

Superuser

Examples

This example shows to create an empty role called roleA.

```
=> CREATE ROLE roleA;  
CREATE ROLE
```

See also

- [ALTER ROLE](#)
- [DROP ROLE](#)

CREATE ROUTING RULE

Creates one of the following rules:

- A load balancing routing rule that directs incoming client connections from an IP address range to a group of Vertica nodes. This group of Vertica nodes is defined by a load balance group. Once you create a routing rule, any client connection originating from the rule's IP address range is redirected to one of the nodes in the load balance group if the client opts into load balancing.
- A [workload routing](#) rule that routes incoming client connections to the specified subcluster. To view existing workload routing rules, see [WORKLOAD ROUTING RULES](#).

Syntax

```
CREATE ROUTING RULE  
{  
  rule_name ROUTE 'address_range' TO group_name |  
  ROUTE WORKLOAD workload_name TO SUBCLUSTER subcluster_name [...] [ PRIORITY priority]  
}
```

Arguments

rule_name

A name for the load balancing routing rule.

address_range

An IPv4 or IPv6 address range in CIDR format, the address range of client connections that this rule applies to.

group_name

The name of the load balance group to handle the client connections from the address range. You create this group with [CREATE LOAD BALANCE GROUP](#).

workload_name

The name of the [workload](#).

subcluster_name

A list of subclusters to [route](#) client connections to.

priority

A non-negative [INTEGER](#), the priority of the workload (default: 0). The greater the value, the greater the priority. If a user or their role is [granted](#) multiple [routing rules](#), the one with the greatest priority applies.

Privileges

Superuser

Examples

The following example creates a routing rule that routes all client connections from 192.168.1.0 to 192.168.1.255 to a load balance group named internal_clients:

```
=> CREATE ROUTING RULE internal_clients ROUTE '192.168.1.0/24' TO internal_clients;  
CREATE ROUTING RULE
```

The following example creates a routing rule that routes **analytics** workloads to subclusters **sc_analytics** and **sc_analytics_2** with a priority of 5. For details, see [Workload routing](#):

```
-> CREATE ROUTING RULE ROUTE WORKLOAD analytics TO SUBCLUSTER sc_analytics, sc_analytics_2 PRIORITY 5;
```

See also

- [ALTER ROUTING RULE](#)
- [DROP ROUTING RULE](#)

CREATE SCHEDULE

Creates a schedule. For details, see [Scheduled execution](#).

To view existing schedules, query [USER_SCHEDULES](#).

Syntax

```
CREATE SCHEDULE [ IF NOT EXISTS ] [[database.]schema.]schedule  
{ USING CRON 'cron_expression' | USING DATETIMES timestamp_list }
```

Arguments

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

[*database* .] *schema*

Database and [schema](#). The default schema is **public**. If you specify a database, it must be the current database.

schedule

The name of the schedule.

cron_expression

A **cron** expression. You should use this for recurring tasks. Value separators are not currently supported.

timestamp_list

A comma-separated list of timestamps. You should use this to schedule non-recurring events at arbitrary times.

Privileges

Superuser

Examples

To create a schedule for October 2, 2022 and November 2, 2022:

```
-> CREATE SCHEDULE ocl_nov_2 USING DATETIMES('2022-10-02 12:00:00', '2022-11-02 12:00:00');
```

To create a schedule for January 1 at 12:00 PM:

```
-> CREATE SCHEDULE annual_schedule USING CRON '0 12 1 1 *';
```

To create a schedule for the first of every month:

```
-> CREATE SCHEDULE monthly_schedule USING CRON '0 0 1 * *';
```

To create a schedule for Sunday at 12:00 AM:

```
-> CREATE SCHEDULE weekly_schedule USING CRON '0 0 * * 0';
```

To create a schedule for every day at 1:00 PM:

```
-> CREATE SCHEDULE daily_schedule USING CRON '0 13 * * *';
```

To create a schedule for every five minutes:

```
-> CREATE SCHEDULE every_5_minutes USING CRON '* /5 * * *';
```

To create a schedule for every hour from 9:00 AM to 4:59 PM:

```
-> CREATE SCHEDULE 9_16_5 USING CRON '0 9-16 * * *'
```

CREATE SCHEMA

Defines a schema.

Syntax

```
CREATE SCHEMA [ IF NOT EXISTS ] [{ namespace. | database. }] schema  
  [ AUTHORIZATION username ]  
  [ DEFAULT { INCLUDE | EXCLUDE } [ SCHEMA ] PRIVILEGES ]  
  [ DISK_QUOTA quota ]
```

Parameters

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

namespace

For Eon Mode databases, [namespace](#) under which to create the schema. If unspecified, the schema is created under the [default_namespace](#).

database

For Enterprise Mode databases, name of the database. If specified, it must be the current database.

schema

Name of the schema to create, with the following requirements:

- Must be unique among all other schema names in the [namespace](#) under which the schema is created.
- Must comply with [keyword restrictions](#) and rules for [Identifiers](#).
- Cannot begin with `v_`; this prefix is reserved for Vertica [system tables](#).

AUTHORIZATION *username*

Valid only for superusers, assigns ownership of the schema to another user. By default, the user who creates a schema is also assigned ownership.

After you create a schema, you can reassign ownership to another user with [ALTER SCHEMA](#).

DEFAULT {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES

Specifies whether to enable or disable default inheritance of privileges for new tables in the specified schema:

- **EXCLUDE SCHEMA PRIVILEGES** (default): Disables inheritance of schema privileges.
- **INCLUDE SCHEMA PRIVILEGES**: Specifies to grant tables in the specified schema the same privileges granted to that schema. This option has no effect on existing tables in the schema.

If you omit **INCLUDE PRIVILEGES**, you must explicitly grant schema privileges on the desired tables.

For more information see [Enabling schema inheritance](#).

DISK_QUOTA *quota*

String, an integer followed by a supported unit: K, M, G, or T. Data-load, DML, and ILM operations that increase the schema's usage beyond the set quota fail. For details, see [Disk quotas](#).

If not specified, the schema has no quota.

Privileges

- Superuser (required to set disk quota)
- [CREATE privilege for the database](#)

Supported sub-statements

CREATE SCHEMA can include one or more sub-statements—for example, to create tables or projections within the new schema. Supported sub-statements include:

- [CREATE TABLE / CREATE TEMPORARY TABLE](#)

- [GRANT statements](#)
- [CREATE PROJECTION](#)
- [CREATE SEQUENCE](#)
- [CREATE TEXT INDEX](#)
- [CREATE VIEW](#)

CREATE SCHEMA statement and all sub-statements are treated as a single transaction. If any statement fails, Vertica rolls back the entire transaction. The owner of the new schema is assigned ownership of all objects that are created within this transaction.

For example, the following **CREATE SCHEMA** statement also grants privileges on the new schema, and creates a table and view of that table:

```

=> \c - Joan
You are now connected as user "Joan".
=> CREATE SCHEMA s1
      GRANT USAGE, CREATE ON SCHEMA s1 TO public
      CREATE TABLE s1.t1 (a varchar)
      CREATE VIEW s1.t1v AS SELECT * FROM s1.t1;
CREATE SCHEMA
=> \dtv s1.*
      List of tables
Schema | Name | Kind | Owner | Comment
-----+-----+-----+-----+-----
s1     | t1   | table | Joan  |
s1     | t1v  | view  | Joan  |
(2 rows)

```

Examples

Create schema **s1** :

```

=> CREATE SCHEMA s1;

```

Create schema **s2** if it does not already exist:

```

=> CREATE SCHEMA IF NOT EXISTS s2;

```

In an Eon Mode database, create schema **s3** in namespace **n1** :

```

=> CREATE SCHEMA n1.s3;
CREATE SCHEMA

```

In an Eon Mode database, create schema **s3** in the **default_namespace** :

```

=> CREATE SCHEMA s3;
CREATE SCHEMA

```

If the schema already exists, Vertica returns a rollback message:

```

=> CREATE SCHEMA IF NOT EXISTS s2;
NOTICE 4214: Object "s2" already exists; nothing was done

```

Create table **t1** in schema **s1** , then grant users **Fred** and **Aniket** access to all existing tables and all privileges on table **t1** :

```

=> CREATE TABLE s1.t1 (c INT);
CREATE TABLE
=> GRANT USAGE ON SCHEMA s1 TO Fred, Aniket;
GRANT PRIVILEGE
=> GRANT ALL PRIVILEGES ON TABLE s1.t1 TO Fred, Aniket;
GRANT PRIVILEGE

```

Enable inheritance on new schema **s3** so all tables created in it automatically inherit its privileges. In this case, new table **s3.t2** inherits USAGE, CREATE, and SELECT privileges, which are automatically granted to all database users:

```
-> CREATE SCHEMA s3 DEFAULT INCLUDE SCHEMA PRIVILEGES;  
CREATE SCHEMA  
  
-> GRANT USAGE, CREATE, SELECT, INSERT ON SCHEMA S3 TO PUBLIC;  
GRANT PRIVILEGE  
  
-> CREATE TABLE s3.t2(i int);  
WARNING 6978: Table "t2" will include privileges from schema "s3"  
CREATE TABLE
```

See also

- [ALTER SCHEMA](#)
- [DROP SCHEMA](#)

CREATE SEQUENCE

Defines a named sequence number generator. Named sequences let you set the default values of primary key columns. Sequences guarantee uniqueness and avoid constraint enforcement issues.

A sequence has minimum and maximum values, a starting position, and an increment. The increment can be positive (ascending) or negative (descending). By default, an ascending sequence starts at 1, its minimum value, and a descending sequence starts at -1, its maximum value. You can specify minimum, maximum, increment, and start values for a new sequence, so long as the values are mathematically consistent.

For more information about sequence types and usage, see [Sequences](#).

Syntax

```
CREATE SEQUENCE [ IF NOT EXISTS ] [[database.]schema.]sequence  
  [ INCREMENT [ BY ] integer ]  
  [ MINVALUE integer | NO MINVALUE ]  
  [ MAXVALUE integer | NO MAXVALUE ]  
  [ START [ WITH ] integer ]  
  [ CACHE integer | NO CACHE ]  
  [ CYCLE | NO CYCLE ]
```

Arguments

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

sequence

Name of the sequence to create, where the name conforms to conventions described in [Identifiers](#). It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

INCREMENT *integer*

Positive or negative minimum value change on each call to [NEXTVAL](#). The default is 1.

This value is a minimum increment size. The sequence can increment by more than this value unless you also specify **NO CACHE**.

MINVALUE *integer* | NO MINVALUE

Minimum value the sequence can generate. The default depends on the direction of the sequence:

- Ascending sequence: 1
- Descending sequence: -2⁶³

MAXVALUE *integer* | NO MAXVALUE

Maximum value the sequence can generate. The default depends on the direction of the sequence:

- Ascending sequence: 2⁶³
- Descending sequence: -1

START [WITH] *integer*

Initial value of the sequence. The next call to [NEXTVAL](#) returns this start value. By default, an ascending sequence begins with the minimum value and a descending sequence begins with the maximum value.

CACHE *integer* | NO CACHE

How many unique sequence numbers to pre-allocate and store in memory on each node for faster access. Vertica sets up caching for each session and distributes it across all nodes. A value of 0 or 1 is equivalent to **NO CACHE**.

Caution

If sequence caching is set to a low number, nodes might request a new set of cache values more frequently. While it supplies a new cache, Vertica must lock the catalog. Until Vertica releases the lock, other database activities such as table inserts are blocked, which can adversely affect overall performance.

By default, the sequence cache is set to 250,000.

For details, see [Distributing sequences](#).

CYCLE | NO CYCLE

How to handle reaching the end of the sequence. The default is **NO CYCLE**, meaning that a call to [NEXTVAL](#) returns an error after the sequence reaches its upper or lower limit. **CYCLE** instead wraps, as follows:

- Ascending sequence: wraps to the minimum value.
- Descending sequence: wraps to the maximum value.

Privileges

Non-superusers: CREATE privilege on the schema

Examples

See [Creating and using named sequences](#).

See also

- [ALTER SEQUENCE](#)
- [DROP SEQUENCE](#)

CREATE SUBNET

Identifies the subnet to which the nodes of a Vertica database belong. Use this statement to configure import/export from a database to other Vertica clusters.

Syntax

```
CREATE SUBNET subnet-name WITH 'subnet-prefix'
```

Parameters

subnet-name

A name you assign to the subnet, where *subnet-name* conforms to conventions described in [Identifiers](#).

subnet-prefix

The subnet prefix in either a dotted-quad number format for IPv4 addresses, or four colon-delimited four-digit hexadecimal numbers for IPv6 addresses. Refer to system table [NETWORK_INTERFACES](#) to get the prefix of all available IP networks.

You can then configure the database to use the subnet for import/export. For details, see [Identify the database or nodes used for import/export](#).

Privileges

Superuser

Examples

```
=> CREATE SUBNET mySubnet WITH '123.4.5.6';  
=> CREATE SUBNET mysubnet WITH 'fd9b:1fcc:1dc4:78d3::';
```

CREATE TABLE

Creates a table in the logical schema. You can specify the column definitions directly, or you can base a table on an existing table using AS or LIKE.

Syntax

Create with column definitions

```
CREATE TABLE [ IF NOT EXISTS ] [[ { namespace. | database. } ]schema.]table
  ( column-definition[,...] [, table-constraint [...]] )
  [ ORDER BY column[,...] ]
  [ segmentation-spec ]
  [ KSAFE [safety] ]
  [ partition-clause ]
  [ { INCLUDE | EXCLUDE } [SCHEMA] PRIVILEGES ]
  [ DISK_QUOTA quota ]
```

Create from another table

```
CREATE TABLE [ IF NOT EXISTS ] [[[ namespace. | database. } ]schema.]table
  { AS-clause | LIKE-clause }
  [ DISK_QUOTA quota ]
```

AS-clause:

```
[ ( column-name-list ) ]
[ { INCLUDE | EXCLUDE } [SCHEMA] PRIVILEGES ]
AS [ /*+ LABEL */ ] [ AT epoch ] query [ ENCODED BY column-ref-list ] [ segmentation-spec ]
```

LIKE-clause:

```
LIKE [[[ namespace. | database. } ]schema.]existing-table
  [ { INCLUDING | EXCLUDING } PROJECTIONS ]
  [ { INCLUDE | EXCLUDE } [SCHEMA] PRIVILEGES ]
```

Arguments

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

namespace

For Eon Mode databases, name of the [namespace](#) under which to create the table. If unspecified, the table is created under the `default_namespace`.

database

For Enterprise Mode databases, name of the database. If specified, it must be the current database.

schema

Name of the schema under which to create the table. If no schema is specified, the table is created in the `public` schema.

table

Name of the table to create, which must be unique among names of all sequences, tables, projections, views, and models within the schema.

column-definition

Column name, [data type](#), and optional constraints. A table can have up to 9800 columns. At least one column in the table must be of a scalar type or native array.

table-constraint

Table-level constraint, as opposed to column constraints.

ORDER BY *column* [...]

Invalid for external tables, specifies columns from the **SELECT** list on which to sort the superprojection that is automatically created for this table. The **ORDER BY** clause cannot include qualifiers **ASC** or **DESC**. Vertica always stores projection data in ascending sort order.

If you omit the **ORDER BY** clause, Vertica uses the **SELECT** list order as the projection sort order.

segmentation-spec

Invalid for external tables, specifies how to distribute data for auto-projections of this table. Supply one of the following clauses:

- [hash-segmentation-clause](#): Specifies to segment data evenly and distribute across cluster nodes. Vertica recommends segmenting large tables.
- [unsegmented-clause](#): Specifies to create an unsegmented projection.

If this clause is omitted, Vertica generates [auto-projections](#) with [default hash segmentation](#).

KSAFE [*safety*]

Invalid for external tables, specifies [K-safety](#) of [auto-projections](#) created for this table, where *k-num* must be equal to or greater than system K-safety. If you omit this option, the projection uses the system K-safety level.

[partition-clause](#)

Invalid for external tables, logically divides table data storage through a PARTITION BY clause:

```
PARTITION BY partition-expression
[ GROUP BY group-expression ] [ ACTIVEPARTITIONCOUNT integer ]
```

[column-name-list](#)

Valid only when creating a table from a query ([AS query](#)), defines column names that map to the query output. If you omit this list, Vertica uses the query output column names.

This clause and the [ENCODED BY](#) clause are mutually exclusive. Column name lists are invalid for external tables.

The names in [column-name-list](#) and queried columns must be the same in number.

For example:

```
CREATE TABLE customer_occupations (name, profession)
AS SELECT customer_name, occupation FROM customer_dimension;
```

{INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES

Default inheritance of schema privileges for this table:

- INCLUDE PRIVILEGES specifies that the table inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema.
- EXCLUDE PRIVILEGES disables inheritance of privileges from the schema.

For details, see [Inherited privileges](#).

AS *query*

Creates and loads a table from the [results of a query](#), specified as follows:

```
AS [ /*+ LABEL */ ] [ AT ] epoch query
```

The query cannot include [complex type](#) columns.

ENCODED BY *column-ref-list*

A comma-delimited list of columns from the source table, where each column is qualified by one or both of the following encoding options:

- [ACCESSRANK](#) *integer*: Overrides the default access rank for a column, useful for prioritizing access to a column. See [Prioritizing column access speed](#).
- [ENCODING](#) *encoding-type*: Specifies the type of encoding to use on the column. The default encoding type is [AUTO](#).

This option and `* column-name-list *` are mutually exclusive. This option is invalid for external tables.

LIKE *existing-table*

Creates the table by [replicating an existing table](#). The user issuing the CREATE TABLE LIKE statement owns the new table, not the original owner.

You can qualify the LIKE clause with one of the following options:

- EXCLUDING PROJECTIONS (default): Do not copy projections from the source table.
- INCLUDING PROJECTIONS: Copy current projections from the source table for the new table.
- {INCLUDE|EXCLUDE} [SCHEMA] PRIVILEGES: See description [above](#).

DISK_QUOTA *quota*

String, an integer followed by a supported unit: K, M, G, or T. Data-load, DML, and ILM operations that increase the table's usage beyond the set quota fail. For details, see [Disk quotas](#).

If not specified, the table has no quota.

Privileges

Superuser to set disk quota.

Non-superuser:

- CREATE privileges on the table schema
- If creating a table that includes a named sequence:
 - SELECT privilege on sequence object
 - USAGE privilege on sequence schema

Restrictions for complex types

Complex types used in native tables have some restrictions, in addition to the restrictions for individual types listed on their reference pages:

- A native table must have at least one column that is a primitive type or a native array (one-dimensional array of a primitive type). If a flex table has real columns, it must also have at least one column satisfying this restriction.
- Complex type columns cannot be used in ORDER BY or PARTITION BY clauses nor as FILLER columns.
- Complex type columns cannot have [constraints](#).
- Complex type columns cannot use DEFAULT or SET USING.
- Expressions returning complex types cannot be used as projection columns, and projections cannot be segmented or ordered by columns of complex types.

Examples

The following example creates a table in the public schema:

```
CREATE TABLE public.Premium_Customer
(
  ID IDENTITY ,
  lname varchar(25),
  fname varchar(25),
  store_membership_card int
);
```

In an Eon Mode database, the following example creates the same table from the previous example, but in the **store** schema of the **company** namespace:

```
CREATE TABLE company.store.Premium_Customer
(
  ID IDENTITY ,
  lname varchar(25),
  fname varchar(25),
  store_membership_card int
);
```

The following example uses LIKE to create a new table from the **Premium_Customer** table:

```
--> CREATE TABLE All_Customers LIKE Premium_Customer;
CREATE TABLE
```

The following example selects columns from one table to use in a new table, using an AS clause:

```

=> CREATE TABLE cust_basic_profile AS SELECT
  customer_key, customer_gender, customer_age, marital_status, annual_income, occupation
  FROM customer_dimension WHERE customer_age>18 AND customer_gender !=";
CREATE TABLE
=> SELECT customer_age, annual_income, occupation FROM cust_basic_profile
  WHERE customer_age > 23 ORDER BY customer_age;
customer_age | annual_income |  occupation
-----
24 | 469210 | Hairdresser
24 | 140833 | Butler
24 | 558867 | Lumberjack
24 | 529117 | Mechanic
24 | 322062 | Acrobat
24 | 213734 | Writer
...

```

The following example creates a table using array columns:

```

=> CREATE TABLE orders(
  orderkey INT,
  custkey INT,
  prodkey ARRAY[VARCHAR(10)],
  orderprices ARRAY[DECIMAL(12,2)],
  orderdate DATE
);

```

The following example uses a ROW complex type:

```

=> CREATE TABLE inventory
  (store INT, products ROW(name VARCHAR, code VARCHAR));

```

The following example uses quotas:

```

=> CREATE SCHEMA internal DISK_QUOTA '10T';
CREATE SCHEMA
=> CREATE TABLE internal.sales (...) DISK_QUOTA '5T';
CREATE TABLE
=> CREATE TABLE internal.leads (...) DISK_QUOTA '12T';
WARNING 0: Table leads has disk quota greater than its schema internal

```

The following statement creates a **flights** table in the **airline** schema under the **airport** namespace:

```

=> CREATE TABLE airport.airline.flights(
  flight_number INT,
  leaving_from VARCHAR,
  arriving_at VARCHAR,
  expected_departure DATE,
  gate VARCHAR
);

```

- [CREATE EXTERNAL TABLE AS COPY](#)
- [CREATE FLEXIBLE TABLE](#)

In this section

- [Column-constraint](#)
- [Column-definition](#)

- [Column-name-list](#)
- [Partition clause](#)
- [Table-constraint](#)

Column-constraint

Adds a constraint to a column's metadata.

Syntax

```
[ { AUTO_INCREMENT | IDENTITY } [ ( args ) ]
[ CONSTRAINT constraint-name ] {
  [ CHECK ( expression ) [ ENABLED | DISABLED ] ]
  [ [ DEFAULT expression ] [ SET USING expression ] | DEFAULT USING expression ]
  [ NULL | NOT NULL ]
  [ { PRIMARY KEY [ ENABLED | DISABLED ] REFERENCES table [ ( column ) ] } ]
  [ UNIQUE [ ENABLED | DISABLED ] ]
}
```

Arguments

You can specify enforcement of several constraints by qualifying them with the keywords **ENABLED** or **DISABLED** . See [Enforcing Constraints](#) below.

{ **AUTO_INCREMENT** | **IDENTITY** } [(*args*)]

Creates a table column whose values are automatically generated by and managed by the database. You cannot change or load values in this column. You can set this constraint on only one table column. You cannot set this constraint in a temporary table.

AUTO_INCREMENT and **IDENTITY** are synonyms.

The following arguments can be added:

```
( { cache-size | start }, increment, [ cache-size ] )
```

- *start* : First value to set for this column (default 1).
- *increment* : How much to change the value for each new row insertion, a positive or negative value (default 1).
- *cache-size* : How many unique values each node caches per session, or 0 or 1 to disable (default 250,000).

For more information about these arguments, see [IDENTITY sequences](#) .

CONSTRAINT *constraint-name*

Assigns a name to the constraint, valid for the following constraints:

- **PRIMARY KEY**
- **REFERENCES** (foreign key)
- **CHECK**
- **UNIQUE**

If you omit assigning a name to these constraints, Vertica assigns its own name. For details, see [Naming constraints](#) .

Vertica recommends that you name all constraints.

CHECK (*expression*)

Sets a Boolean condition to check.

DEFAULT *default-expr*

Sets this column's default value. Vertica evaluates the expression and sets the column on load operations, if the operation omits a value for the column. For details about valid expressions, see [Defining column values](#) .

SET USING *using-expr*

Sets column values from an expression. Vertica evaluates the expression and refreshes column values only when **REFRESH_COLUMNS** is invoked. For details about valid expressions, see [Defining column values](#) .

DEFAULT USING *expression*

Defines the column with **DEFAULT** and **SET USING** constraints, specifying the same expression for both. **DEFAULT USING** columns support the same expressions as **SET USING** columns, and are subject to the same [restrictions](#) .

NULL | **NOT NULL**

Whether the column allows null values.

- **NULL** : Allows null values in the column. If you set this constraint on a primary key column, Vertica ignores it and sets it to **NOT NULL** .

- **NOT NULL** : Requires the column to be set to a value during insert and update operations. If the column has no default value and no value is provided, **INSERT** or **UPDATE** returns an error.

The default is **NULL** for all columns except primary key columns, which Vertica always sets to **NOT NULL** .

For an external table, data violating a **NOT NULL** constraint can produce unexpected results when the table is queried. Use **NOT NULL** for an external table column only if you are sure that the data does not contain nulls.

PRIMARY KEY

Identifies this column as the table's primary key.

REFERENCES *table* [(*column*)]

Identifies this column as a foreign key to a column in another table. If you omit the column, Vertica uses the table's primary key.

UNIQUE

Requires column data to be unique with respect to all table rows.

Privileges

Table owner or user WITH GRANT OPTION is grantor.

- REFERENCES privilege on table to create foreign key constraints that reference this table
- USAGE privilege on schema that contains the table

Enforcing constraints

The following constraints can be qualified with the keyword **ENABLED** or **DISABLED** :

- **PRIMARY KEY**
- **UNIQUE**
- **CHECK**

If you omit **ENABLED** or **DISABLED** , Vertica determines whether to enable the constraint automatically by checking the appropriate [constraints configuration parameter](#) :

- **EnableNewPrimaryKeysByDefault**
- **EnableNewUniqueKeysByDefault**
- **EnableNewCheckConstraintsByDefault**

See also

- [Constraints](#)
- [Constraint enforcement](#)

Column-definition

Specifies the name, data type, and constraints to be applied to a column.

Syntax

```
column-name data-type  
[ column-constraint ][...]  
[ ENCODING encoding-type ]  
[ ACCESSRANK integer ]
```

Parameters

column-name

The name of a column to be created or added.

data-type

A Vertica-supported [data type](#) .

Tip

When specifying the maximum column width in a CREATE TABLE statement, use the width in bytes (octets) for any of the string types. Each UTF-8 character might require four bytes, but European languages generally require a little over one byte per character, while Oriental languages generally require a little under three bytes per character.

[column-constraint](#)

A [constraint type](#) that Vertica supports—for example, [NOT NULL](#) or [UNIQUE](#). For general information, see [Constraints](#).

ENCODING *encoding-type*

The column [encoding type](#), by default set to AUTO.

ACCESSRANK *integer*

Overrides the default access rank for a column. Use this parameter to increase or decrease the speed at which Vertica accesses a column. For more information, see [Overriding Default Column Ranking](#).

Examples

The following example creates a table named `Employee_Dimension` and its associated superprojection in the `public` schema. The `Employee_key` column is designated as a primary key, and RLE encoding is specified for the `Employee_gender` column definition:

```
=> CREATE TABLE public.Employee_Dimension (  
  Employee_key          integer PRIMARY KEY NOT NULL,  
  Employee_gender       varchar(8) ENCODING RLE,  
  Courtesy_title        varchar(8),  
  Employee_first_name   varchar(64),  
  Employee_middle_initial varchar(8),  
  Employee_last_name    varchar(64)  
);
```

Column-name-list

Used to rename columns when creating a table or temporary table [from a query](#); also used to specify the column's [encoding type](#) and [access rank](#).

Syntax

```
column-name-list  
[ ENCODING encoding-type ]  
[ ACCESSRANK integer ]  
[ GROUPED ( column-reference[,...] ) ]
```

Parameters

column-name

Specifies the new name for the column.

ENCODING [*encoding-type*](/sql-reference/statements/create-statements/create-projection/encoding-types.html)

Specifies the type of encoding to use on the column. The default encoding type is `AUTO`.

ACCESSRANK *integer*

Overrides the default access rank for a column, useful for prioritizing access to a column. See [Prioritizing column access speed](#).

GROUPED

Groups two or more columns. For detailed information, see [GROUPED clause](#).

Requirements

- A column in the list can not specify the column's data type or any constraint. These are derived from the queried table.
- If the query output has expressions other than simple columns (for example, constants or functions) then an alias must be specified for that expression, or the column name list must include all queried columns.
- [CREATE TABLE](#) can specify encoding types and access ranks in the column name list or the query's ENCODED BY clause, but not in both. For example, the following CREATE TABLE statement sets encoding and access rank on two columns in the column name list:

```
=> CREATE TABLE promo1 (state ENCODING RLE ACCESSRANK 1, zip ENCODING RLE,...)  
  AS SELECT * FROM customer_dimension ORDER BY customer_state;
```

The next statement specifies the same encoding and access rank in the query's ENCODED BY clause.

```
=> CREATE TABLE promo2  
  AS SELECT * FROM customer_dimension ORDER BY customer_state  
  ENCODED BY customer_state ENCODING RLE ACCESSRANK 1, customer_zip ENCODING RLE;
```

Partition clause

Specifies partitioning of table data, through a PARTITION BY clause in the table definition:

PARTITION BY *partition-expression* [GROUP BY *group-expression*] [*active-partition-count-expr*]

PARTITION BY *partition-expression*

For each table row, resolves to a partition key that is derived from one or more table columns.

Caution

Avoid partitioning tables on LONG VARBINARY and LONG VARCHAR columns. Doing so can adversely impact performance.

GROUP BY *group-expression*

For each table row, resolves to a partition group key that is derived from the partition key. Vertica uses group keys to merge partitions into separate partition groups. GROUP BY must use the same expression as PARTITION BY. For example:

```
...PARTITION BY (i+j) GROUP BY (  
  CASE WHEN (i+j) < 5 THEN 1  
        WHEN (i+j) < 10 THEN 2  
        ELSE 3);
```

For details on partitioning table data by groups, see [Partition grouping](#) and [Hierarchical partitioning](#).

active-partition-count-expr

Specifies how many partitions are active for this table, specified as follows:

- In partition clause of CREATE TABLE:

```
ACTIVEPARTITIONCOUNT integer
```

- In partition clause of ALTER TABLE:

```
SET ACTIVEPARTITIONCOUNT integer
```

This setting supersedes configuration parameter [ActivePartitionCount](#). For details on usage, see [Active and inactive partitions](#).

Partitioning requirements and restrictions

PARTITION BY expressions can specify leaf expressions, functions, and operators. The following requirements and restrictions apply:

- All table projections must include all columns referenced in the expression; otherwise, Vertica cannot resolve the expression.
- The expression can reference multiple columns, but it must resolve to a single non-null value for each row.

Note

You can avoid null-related errors with the function [ZEROIFNULL](#). This function can check a PARTITION BY expression for null values and evaluate them to 0. For example: `CREATE TABLE t1 (a int, b int) PARTITION BY (ZEROIFNULL(a)); CREATE TABLE`

- All leaf expressions must be constants or table columns.
- All other expressions must be functions and operators. The following restrictions apply to functions: * They must be [immutable](#)—that is, they return the same value regardless of time and locale and other session- or environment-specific conditions. * They cannot be [aggregate functions](#). * They cannot be Vertica meta-functions.
- The expression cannot include queries.
- The expression cannot include user-defined data types such as [Geometry](#).

GROUP BY expressions do not support [modulo](#)(%) operations.

Examples

The following statements create the `store_orders` table and load data into it. The CREATE TABLE statement includes a simple partition clause that specifies to partition data by year:

```

=> CREATE TABLE public.store_orders
(
  order_no int,
  order_date timestamp NOT NULL,
  shipper varchar(20),
  ship_date date
)
UNSEGMENTED ALL NODES
PARTITION BY YEAR(order_date);
CREATE TABLE
=> COPY store_orders FROM '/home/dbadmin/export_store_orders_data.txt';
41834

```

As COPY loads the new table data into ROS storage, the Tuple Mover executes the table's partition clause by dividing orders for each year into separate partitions, and consolidating these partitions in ROS containers.

In this case, the Tuple Mover creates four partition keys for the loaded data—2017, 2016, 2015, and 2014—and divides the data into separate ROS containers accordingly:

```

=> SELECT dump_table_partition_keys('store_orders');
... Partition keys on node v_vmart_node0001
Projection 'store_orders_super'
Storage [ROS container]
  No of partition keys: 1
  Partition keys: 2017
Storage [ROS container]
  No of partition keys: 1
  Partition keys: 2016
Storage [ROS container]
  No of partition keys: 1
  Partition keys: 2015
Storage [ROS container]
  No of partition keys: 1
  Partition keys: 2014

Partition keys on node v_vmart_node0002
Projection 'store_orders_super'
Storage [ROS container]
  No of partition keys: 1
  Partition keys: 2017
...
(1 row)

```

As new data is loaded into `store_orders`, the Tuple Mover merges it into the appropriate partitions, creating partition keys as needed for new years.

[Partitioning tables](#)

Table-constraint

Adds a constraint to table metadata. You can specify table constraints with [CREATE TABLE](#), or add a constraint to an existing table with [ALTER TABLE](#).

For details, see [Setting constraints](#).

Adding a constraint to a table that is referenced in a view does not affect the view.

Syntax

```

[ CONSTRAINT constraint-name ]
{
... PRIMARY KEY (column[,...] ) [ ENABLED | DISABLED ]
... | FOREIGN KEY (column[,...] ) REFERENCES table [ (column[,...]) ]
... | UNIQUE (column[,...]) [ ENABLED | DISABLED ]
... | CHECK (expression) [ ENABLED | DISABLED ]
}

```

Parameters

CONSTRAINT *constraint-name*

Assigns a name to the constraint. Vertica recommends that you name all constraints.

PRIMARY KEY

Defines one or more **NOT NULL** columns as the primary key as follows:

```
PRIMARY KEY (column[,...]) [ ENABLED | DISABLED]
```

You can qualify this constraint with the keyword **ENABLED** or **DISABLED** . See [Enforcing Constraints](#) below.

If you do not name a primary key constraint, Vertica assigns the name **C_PRIMARY** .

FOREIGN KEY

Adds a referential integrity constraint defining one or more columns as foreign keys as follows:

```
FOREIGN KEY (column[,... ] ) REFERENCES table [(column[,... ])]
```

If you omit *column* , Vertica references the primary key in *table* .

If you do not name a foreign key constraint, Vertica assigns the name **C_FOREIGN** .

Important

Adding a foreign key constraint requires the following privileges (in addition to privileges also required by ALTER TABLE):

- REFERENCES on the referenced table
- USAGE on the schema of the referenced table

UNIQUE

Specifies that the data in a column or group of columns is unique with respect to all table rows, as follows:

```
UNIQUE (column[,...]) [ENABLED | DISABLED]
```

You can qualify this constraint with the keyword **ENABLED** or **DISABLED** . See [Enforcing Constraints](#) below.

If you do not name a unique constraint, Vertica assigns the name **C_UNIQUE** .

CHECK

Specifies a check condition as an expression that returns a Boolean value, as follows:

```
CHECK (expression) [ENABLED | DISABLED]
```

You can qualify this constraint with the keyword **ENABLED** or **DISABLED** . See [Enforcing Constraints](#) below.

If you do not name a check constraint, Vertica assigns the name **C_CHECK** .

Privileges

Non-superusers: table owner, or the following privileges:

- USAGE on schema
- ALTER on table
- SELECT on table to enable or disable [constraint enforcement](#)

Enforcing constraints

A table can specify whether Vertica automatically enforces a primary key, unique key or check constraint with the keyword **ENABLED** or **DISABLED** . If you omit **ENABLED** or **DISABLED** , Vertica determines whether to enable the constraint automatically by checking the appropriate configuration parameter:

- [EnableNewPrimaryKeysByDefault](#)
- [EnableNewUniqueKeysByDefault](#)
- [EnableNewCheckConstraintsByDefault](#)

For details, see [Constraint enforcement](#) .

Examples

The following example creates a table (**t01**) with a primary key constraint.

```
CREATE TABLE t01 (id int CONSTRAINT sampleconstraint PRIMARY KEY);  
CREATE TABLE
```

This example creates the same table without the constraint, and then adds the constraint with **ALTER TABLE ADD CONSTRAINT**

```
CREATE TABLE t01 (id int);
CREATE TABLE
```

```
ALTER TABLE t01 ADD CONSTRAINT sampleconstraint PRIMARY KEY(id);
WARNING 2623: Column "id" definition changed to NOT NULL
ALTER TABLE
```

The following example creates a table (`addapk`) with two columns, adds a third column to the table, and then adds a primary key constraint on the third column.

```
=> CREATE TABLE addapk (col1 INT, col2 INT);
CREATE TABLE

=> ALTER TABLE addapk ADD COLUMN col3 INT;
ALTER TABLE

=> ALTER TABLE addapk ADD CONSTRAINT col3constraint PRIMARY KEY (col3) ENABLED;
WARNING 2623: Column "col3" definition changed to NOT NULL
ALTER TABLE
```

Using the sample table `addapk` , check that the primary key constraint is enabled (`is_enabled` is `t`).

```
=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_name IN ('addapk');

constraint_name | column_name | constraint_type | is_enabled
-----+-----+-----+-----
col3constraint | col3       | p               | t
(1 row)
```

This example disables the constraint using `ALTER TABLE ALTER CONSTRAINT` .

```
=> ALTER TABLE addapk ALTER CONSTRAINT col3constraint DISABLED;
```

Check that the primary key is now disabled (`is_enabled` is `f`).

```
=> SELECT constraint_name, column_name, constraint_type, is_enabled FROM PRIMARY_KEYS WHERE table_name IN ('addapk');

constraint_name | column_name | constraint_type | is_enabled
-----+-----+-----+-----
col3constraint | col3       | p               | f
(1 row)
```

For a general discussion of constraints, see [Constraints](#) . For additional examples of creating and naming constraints, see [Naming constraints](#) .

```
CREATE TEMPORARY TABLE
```

Creates a table whose data persists only during the current session. By default, temporary table data is not visible to other sessions.

Syntax

Create with column definitions:

```
CREATE [ scope ] TEMP[ORARY] TABLE [ IF NOT EXISTS ] [{{namespace. | database. }}schema.]table-name
( column-definition[,...] )
[ table-constraint ]
[ ON COMMIT { DELETE | PRESERVE } ROWS ]
[ NO PROJECTION ]
[ ORDER BY table-column[,...] ]
[ segmentation-spec ]
[ KSAFE [safety-level] ]
[ {INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES ]
[ DISK_QUOTA quota ]
```

Create from another table:

```
CREATE TEMP[ORARY] TABLE [ IF NOT EXISTS ] [{ namespace. | database. }]schema.]table-name
[ ( column-name-list )
[ ON COMMIT { DELETE | PRESERVE } ROWS ]
AS [ /*+ LABEL */ ] [ AT epoch ] query [ ENCODED BY column-ref-list ]
[ DISK_QUOTA quota ]
```

Parameters

scope

Visibility of the table definition:

- GLOBAL : The table definition is visible to all sessions, and persists until you explicitly drop the table.
- LOCAL : the table definition is visible only to the session in which it is created, and is dropped when the session ends.

If no scope is specified, Vertica uses the default that is set by the [DefaultTempTableLocal](#) configuration parameter.

Regardless of this setting, retention of temporary table data is set by the keywords ON COMMIT DELETE and ON COMMIT PRESERVE (see below).

For more information, see [Creating temporary tables](#).

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

{ namespace. | database. }

Qualifies the *schema* name with one of the following names, depending on the mode of the database:

- Eon Mode: name of the [namespace](#) to which the schema belongs. If unspecified, the namespace is assumed to be [default_namespace](#) . If [scope](#) is set to LOCAL, the namespace must be [default_namespace](#) .
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#) . If you specify the [namespace](#) or [database](#) name, you must specify the schema name, even if the schema is [public](#) .

table-name

Name of the table to create, where *table-name* conforms to conventions described in [Identifiers](#) . It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

column-definition

Column names and types. A table can have up to 9800 columns.

table-constraint

Adds a constraint to table metadata.

ON COMMIT

Whether data is transaction- or session-scoped:

```
ON COMMIT {PRESERVE | DELETE} ROWS
```

- DELETE (default) marks the temporary table for transaction-scoped data. Vertica removes all table data after each commit.
- PRESERVE marks the temporary table for session-scoped data, which is preserved beyond the lifetime of a single transaction. Vertica removes all table data when the session ends.

NO PROJECTION

Prevents Vertica from creating auto-projections for this table. A superprojection is created only when data is explicitly loaded into this table.

NO PROJECTION is invalid with the following clauses:

- ORDER BY
- KSAFE
- Any segmentation clause ([hash-segmentation-clause](#) or [unsegmented-clause](#)).

{INCLUDE | EXCLUDE} [SCHEMA] PRIVILEGES

Default inheritance of schema privileges for this table:

- **INCLUDE PRIVILEGES** specifies that the table inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema.
- **EXCLUDE PRIVILEGES** disables inheritance of privileges from the schema.

For details, see [Inherited privileges](#).

ORDER BY *table-column* [...]

Invalid for external tables, specifies columns from the **SELECT** list on which to sort the superprojection that is automatically created for this table. The **ORDER BY** clause cannot include qualifiers **ASC** or **DESC**. Vertica always stores projection data in ascending sort order. If you omit the **ORDER BY** clause, Vertica uses the **SELECT** list order as the projection sort order.

segmentation-spec

Invalid for external tables, specifies how to distribute data for auto-projections of this table. Supply one of the following clauses:

- [hash-segmentation-clause](#): Specifies to segment data evenly and distribute across cluster nodes. Vertica recommends segmenting large tables.
- [unsegmented-clause](#): Specifies to create an unsegmented projection.

If this clause is omitted, Vertica generates [auto-projections](#) with [default hash segmentation](#).

KSAFE [*safety-level*]

Invalid for external tables, specifies **K-safety** of [auto-projections](#) created for this table, where *k-num* must be equal to or greater than system K-safety. If you omit this option, the projection uses the system K-safety level.

Eon Mode: K-safety of temporary tables is always set to 0, regardless of system K-safety. If a **CREATE TEMPORARY TABLE** statement sets *k-num* greater than 0, Vertica returns an warning.

[column-name-list](#)

Valid only when creating a table from a query (**AS query**), defines column names that map to the query output. If you omit this list, Vertica uses the query output column names.

This clause and the **ENCODED BY** clause are mutually exclusive. Column name lists are invalid for external tables.

The names in *column-name-list* and queried columns must be the same in number.

For example:

```
CREATE TEMP TABLE customer_occupations (name, profession)
AS SELECT customer_name, occupation FROM customer_dimension;
```

AS query

Creates and loads a table from the [results of a query](#), specified as follows:

```
AS [ /*+ LABEL */ ] [ AT ] epoch query
```

The query cannot include [complex type](#) columns.

ENCODED BY *column-ref-list*

A comma-delimited list of columns from the source table, where each column is qualified by one or both of the following encoding options:

- **ACCESSRANK** *integer*: Overrides the default access rank for a column, useful for prioritizing access to a column. See [Prioritizing column access speed](#).
- **ENCODING** [encoding-type](#): Specifies the type of encoding to use on the column. The default encoding type is **AUTO**.

This option and **column-name-list** are mutually exclusive. This option is invalid for external tables.

DISK_QUOTA *quota*

String, an integer followed by a supported unit: K, M, G, or T. If the schema has a quota, this value must be smaller than the schema quota. Data-load and ILM operations that increase the table's usage beyond the set quota fail. For details, see [Disk quotas](#).

If not specified, the table has no quota.

Disk quota is valid for global temporary tables but not local ones.

Privileges

The following privileges are required:

- CREATE privileges on the table schema
- If creating a temporary table that includes a named sequence:
 - SELECT privilege on sequence object
 - USAGE privilege on sequence schema

Restrictions

- Queries on temporary tables are subject to the same restrictions on SQL support as persistent tables.
- You cannot add projections to non-empty, global temporary tables (ON COMMIT PRESERVE ROWS). Make sure that projections exist before you load data. See [Auto-projections](#).
- While you can add projections for temporary tables that are defined with ON COMMIT DELETE ROWS specified, be aware that you might lose all data.
- Mergeout operations cannot be used on session-scoped temporary data.
- In general, session-scoped temporary table data is not visible using system (virtual) tables.
- Temporary tables do not recover. If a node fails, queries that use the temporary table also fail. Restart the session and populate the temporary table.
- Local temporary tables cannot have disk quotas.

Examples

See [Creating temporary tables](#).

See also

- [ALTER TABLE](#)
- [CREATE TABLE](#)

CREATE TEXT INDEX

Creates a text index used to perform text searches. If data within a table is partitioned, then an extra column appears in the text index, showing the partition.

Syntax

```
CREATE TEXT INDEX [[database.]schema.]txtindex-name
ON [schema.]source-table (unique-id, text-field [, column-name,...])
[STEMMER {stemmer-name(stemmer-input-data-type)} NONE]
[TOKENIZER tokenizer-name(tokenizer-input-data-type)];
```

Parameters

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database. If you do not specify a schema, the table is created in the default schema.

txtindex-name

The text index name.

source-table

The source table to index.

unique-id

The name of the column in the source table that contains a unique identifier. Any data type is permissible. The column must be the primary key in the source table.

text-field

The name of the column in the source table that contains the text field. Valid data types are:

- CHAR
- VARCHAR
- LONG VARCHAR
- VARBINARY
- LONG VARBINARY

Nulls are allowed.

column-name

The name of a column or columns to be included as additional columns.

stemmer-name

The name of the stemmer.

stemmer-input-data-type

The input data type of the *stemmer-name* function.

tokenizer-name

Specifies the name of the tokenizer.

tokenizer-input-data-type

This value is the input data type of the *tokenizer-name* function. It can accept any number of arguments.

If a [Vertica tokenizers](#) is used, then this parameter can be omitted.

Privileges

The index automatically inherits the query permissions of its parent table. The table owner and dbadmin will be allowed to create and/or modify the indices.

Important

Do not alter the contents or definitions of the text index. If the contents or definitions of the text index are altered, then the results will not appropriately match the source table.

Requirements

- Requires there be a column with a unique identifier set as the primary key.
- The source table must have an associated projection, and must be both sorted and segmented by the primary key.

Examples

The following example shows how to create a text index with an additional unindexed column on the table `t_log` using the `CREATE TEXT INDEX` statement:

```
=> CREATE TEXT INDEX t_log_index ON t_log (id, text, day_of_week);
```

```
CREATE INDEX
```

```
=> SELECT * FROM t_log_index;
```

```
token      | doc_id | day_of_week
```

```
-----+-----+-----
'catalog   |    1 | Monday
'dbadmin'  |    2 | Monday
2014-06-04 |    1 | Monday
2014-06-04 |    2 | Monday
2014-06-04 |    3 | Monday

11:00:49.568 | 3     | 2013
11:00:49.570 | 7     | 2013
11:00:49.571 | 8     | 2013
45035996273704966 | 3 | 2013
...
(89 rows)

```

See also

- [Using text search](#)
- [DROP TEXT INDEX](#)

CREATE TLS CONFIGURATION

Creates a TLS Configuration object. For information on existing TLS Configuration objects, query [TLS_CONFIGURATIONS](#).

To modify an existing TLS Configuration object, see [ALTER TLS CONFIGURATION](#).

Syntax

```

CREATE TLS CONFIGURATION tls_config_name {
  [ CERTIFICATE { NULL | cert_name } ]
  [ CA CERTIFICATES ca_cert_name [...] ]
  [ CIPHER SUITES { " | 'openssl_cipher [...]' } ]
  [ TLSMODE 'tlsmode' ]
}

```

Parameters

tls_config_name

The name of the TLS Configuration object.

cert_name

A certificate created with [CREATE CERTIFICATE](#).

ca_cert_name

A CA certificate created with [CREATE CERTIFICATE](#).

openssl_cipher

A comma-separated list of cipher suites to use instead of the default set of cipher suites. Providing an empty string for this parameter clears the alternate cipher suite list and instructs the specified TLS Configuration to use the default set of cipher suites.

To view enabled cipher suites, use [LIST_ENABLED_CIPHERS](#).

tlsmode

How Vertica establishes TLS connections and handles client certificates, one of the following, in order of ascending security:

- **DISABLE** : Disables TLS. All other options for this parameter enable TLS.
- **ENABLE** : Enables TLS. Vertica does not check client certificates.
- **TRY_VERIFY** : Establishes a TLS connection if one of the following is true:
 - the other host presents a valid certificate
 - the other host doesn't present a certificate

If the other host presents an invalid certificate, the connection will use plaintext.

- **VERIFY_CA** : Connection succeeds if Vertica verifies that the other host's certificate is from a trusted CA. If the other host does not present a certificate, the connection uses plaintext.
- **VERIFY_FULL** : Connection succeeds if Vertica verifies that the other host's certificate is from a trusted CA and the certificate's **cn** (Common Name) or **subjectAltName** attribute matches the hostname or IP address of the other host.
Note that for client certificates, **cn** is used for the username, so **subjectAltName** must match the hostname or IP address of the other host.

VERIFY_FULL is unsupported for client-server TLS (the **server** TLS Configuration context) and behaves as **VERIFY_CA** .

CREATE TRIGGER

Creates a trigger. For details, see [Triggers](#).

Syntax

```
CREATE TRIGGER [ IF NOT EXISTS ] [[database.]schema.]trigger
ON SCHEDULE [[database.]schema.]schedule
EXECUTE PROCEDURE procedure AS DEFINER
```

Parameters

IF NOT EXISTS

If an object with the same name exists, return without creating the object. If you do not use this directive and the object already exists, Vertica returns with an error message.

The **IF NOT EXISTS** clause is useful for SQL scripts where you might not know if the object already exists. The [ON ERROR STOP](#) directive can be helpful in scripts.

[*database.*] *schema*

Database and [schema](#) . The default schema is **public** . If you specify a database, it must be the current database.

trigger

The name of the trigger.

schedule

The [schedule](#) with which to associate the trigger.

procedure

The function signature of the [stored procedure](#) .

AS DEFINER

The user to [execute](#) the stored procedure as. Currently, the only option is **DEFINER**, which executes the stored procedure as the definer of the trigger.

Privileges

Superuser

Examples

CREATE TRIGGER requires a [schedule](#) and [stored procedure](#) :

```
=> CREATE PROCEDURE revoke_all_on_table(table_name VARCHAR, user_name VARCHAR)
LANGUAGE PLvSQL
AS $$
BEGIN
    EXECUTE 'REVOKE ALL ON ' || QUOTE_IDENT(table_name) || ' FROM ' || QUOTE_IDENT(user_name);
END;
$$;

=> CREATE SCHEDULE 24_hours_later USING DATETIMES('2022-12-16 12:00:00');
```

To create the trigger with schedule `24_hours_later` and stored procedure `revoke_all_on_table()` with arguments `customer_dimension` and `Bob` :

```
=> CREATE TRIGGER revoke_trigger ON SCHEDULE 24_hours_later EXECUTE PROCEDURE revoke_all_on_table('customer_dimension', 'Bob') AS
DEFINER;;
```

CREATE USER

Adds a name to the list of authorized database users.

Note

New users lack default access to the PUBLIC schema. Be sure to grant new users [USAGE privileges on the PUBLIC schema](#).

Syntax

```
CREATE USER user-name [ parameter value[...] ]
```

Arguments

user-name

Name of the new user, where the value conforms to conventions described in [Identifiers](#).

parameter value

One or more user account parameter settings (see below). Note that the parameter name and value are separated by a space, not `=`.

Parameters

ACCOUNT

Locks or unlocks user access to the database, one of the following:

- **UNLOCK** (default)
- **LOCK** prevents a new user from logging in. This can be useful when creating an account for a user who does not need immediate access.

Tip

To automate account locking, set a maximum number of failed login attempts with [CREATE PROFILE](#).

GRACEPERIOD

Specifies how long a user query can block on any session socket, one of the following:

- **NONE** (default): Removes any grace period previously set on session queries.
- `'interval'`: Specifies as an [interval](#) the maximum grace period for current session queries, up to 20 days.

For details, see [Handling session socket blocking](#).

IDENTIFIED BY { '*password*' | '*hashed-password*' SALT '*hash-salt*' }

Sets the user's password. Options are:

- **password**: ASCII password that Vertica then hashes for internal storage. An empty string enables this user to access the database with no password.
- **hashed-password**: A pre-hashed password and its associated hex string **hash-salt**. Setting a password this way bypasses all [password complexity requirements](#).

Important

If you omit this parameter, this user can access the database with no password.

For details, see [Password guidelines](#) and [Creating a database name and password](#).

IDLESESSIONTIMEOUT

The length of time the system waits before disconnecting an idle session, one of the following:

- **NONE** (default): No limit set for this user. If you omit this parameter, no limit is set for this user.
- `'interval'`: An interval value, up to one year.

For details, see [Managing client connections](#).

MAXCONNECTIONS

Sets the maximum number of connections the user can have to the server, one of the following:

- **NONE** (default): No limit set. If you omit this parameter, the user can have an unlimited number of connections across the database cluster.
- **integer ON DATABASE** : Sets to *integer* the maximum number of connections across the database cluster.
- **integer ON NODE** : Sets to *integer* the maximum number of connections to each node.

For details, see [Managing client connections](#).

MEMORYCAP

Sets how much memory can be allocated to user requests, one of the following:

- **NONE** (default): No limit
- A string value that specifies the memory limit, one of the following:
 - '*int*%' expresses the maximum as a percentage of total memory available to the Resource Manager, where *int* is an integer value between 0 and 100. For example:
MEMORYCAP '40%'
 - '*int*{K|M|G|T}' expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:
MEMORYCAP '10G'

PASSWORD EXPIRE

Forces immediate expiration of the user's password. The user must change the password on the next login.

Note

PASSWORD EXPIRE has no effect when using external password authentication methods such as LDAP or Kerberos.

PROFILE

Assigns a [profile](#) that controls password requirements for this user, one of the following:

- **DEFAULT** (default): Assigns the default database profile to this user.
- **profile-name**: A profile that is defined by [CREATE PROFILE](#).

If you omit this parameter, the user is assigned the default profile.

RESOURCE POOL *pool-name* [FOR SUBCLUSTER *sc-name*]

Assigns a resource pool to this user. The user must also be [granted privileges to this pool](#), unless privileges to the pool are set to **PUBLIC**. The **FOR SUBCLUSTER** clause assigns a subcluster-specific resource pool to the user. You can assign only one subcluster-specific resource pool to each user.

RUNTIMECAP

Sets how long this user's queries can execute, one of the following:

- **NONE** (default): No limit set for this user. If you omit this parameter, no limit is set for this user.
- '*interval*': An interval value, up to one year.

A query's runtime limit can be set at three levels: the user's runtime limit, the user's resource pool, and the session setting. For more information, see [Setting a runtime limit for queries](#).

SEARCH_PATH

Specifies the user's default search path, that tells Vertica which schemas to search for unqualified references to tables and UDFs, one of the following:

- **DEFAULT** (default): Sets the search path as follows:

```
"$user", public, v_catalog, v_monitor, v_internal
```

- Comma-delimited list of schemas.

For details, see [Setting Search Paths](#).

TEMPSPACECAP

Sets how much temporary file storage is available for user requests, one of the following:

- **NONE** (default): No limit
- String value that specifies the storage limit, one of the following:
 - *int* % expresses the maximum as a percentage of total temporary storage available to the Resource Manager, where *int* is an integer value between 0 and 100. For example:
`TEMPSPACECAP '40%'`
 - *int* {K|M|G|T} expresses storage allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:
`TEMPSPACECAP '10G'`

Privileges

Superuser

User name best practices

Vertica database user names are logically separate from user names of the operating system in which the server runs. If all the users of a particular server also have accounts on the server's machine, it makes sense to assign database user names that match their operating system user names. However, a server that accepts remote connections might have many database users with no local operating system account. In this case, there is no need to connect database and system user names.

Examples

```
=> CREATE USER Fred IDENTIFIED BY 'Mxyzptik';
=> GRANT USAGE ON SCHEMA PUBLIC to Fred;
```

See also

- [ALTER USER](#)
- [DROP USER](#)

CREATE VIEW

Defines a [view](#). Views are read only, so they do not support insert, update, delete, or copy operations.

Syntax

```
CREATE [ OR REPLACE ] VIEW [[database.]schema.]view [ (column[,...]) ]
[ {INCLUDE|EXCLUDE} [SCHEMA] PRIVILEGES ] AS query
```

Parameters

OR REPLACE

Specifies to overwrite the existing view *view-name*. If you omit this option and *view-name* already exists, **CREATE VIEW** returns an error.

Any grants assigned to the view before you execute a CREATE OR REPLACE remain on the updated view. See [GRANT \(view\)](#).

[*database*] *schema*

Database and [schema](#). The default schema is **public**. If you specify a database, it must be the current database.

view

Identifies the view to create, where *view* conforms to conventions described in [Identifiers](#). It must also be unique among all names of sequences, tables, projections, views, and models within the same schema.

***column* [...]**

List of up to 9800 names to use as view column names. Vertica maps view column names to query columns according to the order of their respective lists. By default, the view uses column names as they are specified in the query.

query

A [SELECT](#) statement that the temporary view executes. The **SELECT** statement can reference tables, temporary tables, and other views.

{INCLUDE|EXCLUDE}[SCHEMA] PRIVILEGES

Specifies whether this view inherits schema privileges:

- **INCLUDE PRIVILEGES** specifies that the view inherits privileges that are set on its schema. This is the default behavior if privileges inheritance is enabled for the schema.
- **EXCLUDE PRIVILEGES** disables inheritance of privileges from the schema.

For details, see [Inherited privileges](#).

Privileges

See [Creating views](#).

Examples

The following example shows how to create a view that contains data from multiple tables.

```
=> CREATE VIEW temp_t0 AS SELECT * from t0_p1 UNION ALL
SELECT * from t0_p2 UNION ALL
SELECT * from t0_p3 UNION ALL
SELECT * from t0_p4 UNION ALL
SELECT * from t0_p5;
```

See also

- [ALTER VIEW](#)
- [CREATE LOCAL TEMPORARY VIEW](#)
- [Creating views](#)
- [DROP VIEW](#)
- [GRANT \(view\)](#)
- [REVOKE \(view\)](#)

DEACTIVATE DIRECTED QUERY

Deactivates one or more directed queries previously activated by [ACTIVATE DIRECTED QUERY](#).

Syntax

```
DEACTIVATE DIRECTED QUERY { query-name | input-query | where-clause }
```

Arguments

query-name

Name of the directed query to deactivate, as stored in the [DIRECTED_QUERIES](#) column *query_name*.

input-query

The input query of the directed queries to deactivate. Use this argument to deactivate multiple direct queries that map to the same input query.

where-clause

Resolves to one or more directed queries that are filtered from system table [DIRECTED_QUERIES](#). For example, the following statement specifies to deactivate all directed queries with the same *save_plans_version* identifier:

```
=> DEACTIVATE DIRECTED QUERY WHERE save_plans_version = 21;
```

Privileges

[Superuser](#)

Examples

See [Managing directed queries](#).

DELETE

Removes the specified rows from a table and returns a count of the deleted rows. A count of 0 is not an error, but indicates that no rows matched the condition. An unqualified DELETE statement (one that omits a WHERE clause) removes all rows but leaves intact table columns, projections, and constraints.

DELETE supports subqueries and joins, so you can delete values in a table based on values in other tables.

Important

The Vertica implementation of DELETE differs from traditional databases: it does not delete data from disk storage, but instead marks rows as deleted so they are available for historical queries. Deleted data remains on disk, and counts against disk quota, until purged.

Syntax

```
DELETE [ /*+LABEL (label-string)*! ] FROM [{{namespace. | database. }}schema.]table [ where-clause ]
```

Arguments

LABEL

Assigns a label to a statement to identify it for profiling and debugging.

{ *namespace*. | *database*. }

Name of the database or [namespace](#) that contains *table*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be `default_namespace` .
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default `public` . If you specify the namespace or database name, you must provide the schema name, even if the schema is `public` .

table

Any table, including temporary tables.

where-clause

Which rows to mark for deletion. If you omit this clause, DELETE behavior varies depending on whether the table is persistent or temporary. See below for details.

Privileges

Table owner or user with GRANT OPTION is grantor.

- DELETE privilege on table
- USAGE privilege on the schema of the target table
- SELECT privilege on a table when the DELETE statement includes a WHERE or SET clause that specifies columns from that table.

Restrictions

You cannot execute DELETE on an [immutable table](#) .

Committing successive table changes

Vertica follows the SQL-92 transaction model, so successive INSERT, UPDATE, and DELETE statements are included in the same transaction. You do not need to explicitly start this transaction; however, you must explicitly end it with [COMMIT](#) , or implicitly end it with [COPY](#) . Otherwise, Vertica discards all changes that were made within the transaction.

Persistent and temporary tables

When deleting from a persistent table, DELETE removes data directly from the ROS.

DELETE execution on temporary tables varies, depending on whether the table was created with ON COMMIT DELETE ROWS (default) or ON COMMIT PRESERVE ROWS :

- If DELETE contains a WHERE clause that specifies which rows to remove, behavior is identical: DELETE marks the rows for deletion. In both cases, you cannot roll back to an earlier savepoint.
- If DELETE omits a WHERE clause and the table was created with ON COMMIT PRESERVE ROWS , Vertica marks all table rows for deletion. If the table was created with ON COMMIT DELETE ROWS , DELETE behaves like [TRUNCATE TABLE](#) and removes all rows from storage.

Note

If you issue an unqualified DELETE statement on a temporary table created with ON COMMIT DELETE ROWS , Vertica removes all rows from storage but does not end the transaction.

Examples

The following statement removes all rows from a temporary table:

```
=> DELETE FROM temp1;
```

The following statement deletes all records from a schema-qualified table where a condition is satisfied:

```
=> DELETE FROM retail.customer WHERE state IN ('MA', 'NH');
```

For examples that show how to nest a subquery within a DELETE statement, see [Subqueries in UPDATE and DELETE](#) .

See also

- [DROP TABLE](#)
- [TRUNCATE TABLE](#)
- [Removing table data](#)
- [Optimizing DELETE and UPDATE](#)

DISCONNECT

Closes a connection to another Vertica database that was opened in the same session with [CONNECT TO VERTICA](#).

Note

Closing your session also closes the database connection. However, it is a good practice to explicitly close the connection to the other database, both to free up resources and to prevent issues with other SQL scripts that might be running in your session. Always closing the connection prevents potential errors if you run a script in the same session that attempts to open a connection to the same database, since each session can only have one connection to a given database at a time.

Syntax

```
DISCONNECT db-spec
```

Parameters

db-spec

Specifies the target database, either the database name or **DEFAULT**.

Privileges

None

Examples

```
=> DISCONNECT DEFAULT;  
DISCONNECT
```

DO

Executes an anonymous (unnamed) [stored procedure](#) without saving it.

Syntax

```
DO [ LANGUAGE 'language-name' ] $$  
  source  
$$;
```

Parameters

language-name

Specifies the language of the procedure *source*, one of the following (both options refer to [PLvSQL](#); PLpgSQL is included to maintain compatibility with existing scripts):

- PLvSQL
- PLpgSQL

Default: PLvSQL

source

The source code of the procedure.

Privileges

None

Examples

For more complex examples, see [Stored procedures: use cases and examples](#)

This procedure prints the variables in the DECLARE block:

```
DO LANGUAGE PLvSQL $$
DECLARE
  x int := 3;
  y varchar := 'some string';
BEGIN
  RAISE NOTICE 'x = %', x;
  RAISE NOTICE 'y = %', y;
END;
$$;
```

NOTICE 2005: x = 3

NOTICE 2005: y = some string

For more information on RAISE NOTICE, see [Errors and diagnostics](#).

DROP statements

DROP statements let you delete database objects such as schemas, tables, and users.

In this section

- [DROP ACCESS POLICY](#)
- [DROP AGGREGATE FUNCTION](#)
- [DROP ANALYTIC FUNCTION](#)
- [DROP AUTHENTICATION](#)
- [DROP CA BUNDLE](#)
- [DROP CERTIFICATE](#)
- [DROP DATA LOADER](#)
- [DROP DIRECTED QUERY](#)
- [DROP FAULT GROUP](#)
- [DROP FILTER](#)
- [DROP FUNCTION](#)
- [DROP KEY](#)
- [DROP LIBRARY](#)
- [DROP LOAD BALANCE GROUP](#)
- [DROP MODEL](#)
- [DROP NAMESPACE](#)
- [DROP NETWORK ADDRESS](#)
- [DROP NETWORK INTERFACE](#)
- [DROP NOTIFIER](#)
- [DROP PARSER](#)
- [DROP PROCEDURE \(external\)](#)
- [DROP PROCEDURE \(stored\)](#)
- [DROP PROFILE](#)
- [DROP PROJECTION](#)
- [DROP RESOURCE POOL](#)
- [DROP ROLE](#)
- [DROP ROUTING RULE](#)
- [DROP SCHEDULE](#)
- [DROP SCHEMA](#)
- [DROP SEQUENCE](#)
- [DROP SOURCE](#)
- [DROP SUBNET](#)
- [DROP TABLE](#)
- [DROP TEXT INDEX](#)
- [DROP TLS CONFIGURATION](#)
- [DROP TRANSFORM FUNCTION](#)

- [DROP TRIGGER](#)
- [DROP USER](#)
- [DROP VIEW](#)

DROP ACCESS POLICY

Removes an access policy from a column or row.

Syntax

```
DROP ACCESS POLICY ON table FOR { COLUMN column | ROWS }
```

Parameters

table

Name of the table that contains the column access policy to remove

column

Name of the column that contains the access policy to remove

Privileges

Non-superuser: Ownership of the table

Examples

These examples show various cases where you can drop an access policy.

Drop column access policy:

```
=> DROP ACCESS POLICY ON customer FOR COLUMN Customer_Number;
```

Drop row access policy on a table:

```
=> DROP ACCESS POLICY ON customer_info FOR ROWS;
```

DROP AGGREGATE FUNCTION

Drops a user-defined aggregate function (UDAnF) from the Vertica catalog.

Syntax

```
DROP AGGREGATE FUNCTION [ IF EXISTS ] [[database.]schema.]function( [ arglist ] )
```

Parameters

IF EXISTS

Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

function

Specifies a name of the SQL function to drop. If the function name is schema-qualified, the function is dropped from the specified schema (as noted above).

arglist

A comma delimited list of argument names and data types that are passed to the function, formatted as follows:

```
{ [argname] argtype }[,...]
```

- *argname* optionally specifies the argument name, typically a column name.
- *argtype* specifies the argument's data type, where *argtype* matches a Vertica [data type](#).

Privileges

Non-superuser: Owner

Requirements

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.
- Vertica does not check for dependencies, so if you drop a SQL function where other objects reference it (such as views or other SQL functions), Vertica returns an error when those objects are used and not when the function is dropped.

Examples

The following command drops the `ag_avg` function:

```
=> DROP AGGREGATE FUNCTION ag_avg(numeric);  
DROP AGGREGATE FUNCTION
```

See also

[Aggregate functions \(UDAFs\)](#)

DROP ANALYTIC FUNCTION

Drops a user-defined analytic function from the Vertica catalog.

Syntax

```
DROP ANALYTIC FUNCTION [ IF EXISTS ] [[database.]schema.]function( [ arglist ] )
```

Parameters

IF EXISTS

Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

[*database.*] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

function

Specifies a name of the SQL function to drop. If the function name is schema-qualified, the function is dropped from the specified schema (as noted above).

arglist

A comma delimited list of argument names and data types that are passed to the function, formatted as follows:

```
{ [argname] argtype }[,...]
```

- *argname* optionally specifies the argument name, typically a column name.
- *argtype* specifies the argument's data type, where *argtype* matches a Vertica [data type](#).

Privileges

Non-superuser: Owner

Requirements

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.
- Vertica does not check for dependencies, so if you drop a SQL function where other objects reference it (such as views or other SQL functions), Vertica returns an error when those objects are used and not when the function is dropped.

Examples

The following command drops the `analytic_avg` function:

```
=> DROP ANALYTIC FUNCTION analytic_avg(numeric);  
DROP ANALYTIC FUNCTION
```

See also

[Analytic functions \(UDAnFs\)](#)

DROP AUTHENTICATION

Drops an authentication method.

Syntax

```
DROP AUTHENTICATION [ IF EXISTS ] auth-method-name [ CASCADE ]
```

Parameters

IF EXISTS

Specifies not to report an error if the authentication method to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

auth-method-name

Name of the authentication method to drop.

CASCADE

Required if the authentication method to drop is granted to users. In this case, omission of this option causes the drop operation to fail.

Privileges

Superuser

Examples

Delete authentication method `md5_auth` :

```
=> DROP AUTHENTICATION md5_auth;
```

Use `CASCADE` to drop authentication method that was granted to a user:

```
=> CREATE AUTHENTICATION localpwd METHOD 'password' LOCAL;  
=> GRANT AUTHENTICATION localpwd TO jsmith;  
=> DROP AUTHENTICATION localpwd CASCADE;
```

See also

- [ALTER AUTHENTICATION](#)
- [CREATE AUTHENTICATION](#)
- [GRANT \(authentication\)](#)
- [REVOKE \(authentication\)](#)

DROP CA BUNDLE

Deprecated

CA bundles are only usable with certain deprecated parameters in [Kafka notifiers](#). You should prefer using [TLS configurations](#) and the `TLS CONFIGURATION` parameter for notifiers instead.

Drops a certificate authority (CA) bundle.

Syntax

```
DROP CA BUNDLE [ IF EXISTS ] name [...] [ CASCADE ]
```

Parameters

IF EXISTS

Vertica does not report an error if the CA bundle to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

name

The name of the CA bundle.

CASCADE

Drops dependent objects before dropping the CA bundle.

Privileges

Ownership of the CA bundle

Examples

See [Managing CA bundles](#).

See also

- [CREATE CA BUNDLE](#)
- [ALTER CA BUNDLE](#)

DROP CERTIFICATE

Drops a TLS certificate from the database.

To view existing certificates, query [CERTIFICATES](#).

Syntax

```
DROP CERTIFICATE [ IF EXISTS ] certificate-name [...] [ CASCADE ]
```

Parameters

IF EXISTS

Vertica does not report an error if the certificate to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

certificate-name

The name of the certificate to drop.

CASCADE

Drops dependent objects before dropping the certificate.

Predefined TLS Configurations and TLS Configurations that manage a connection type cannot be [dropped](#), nor can the keys and certificates referenced by such TLS Configurations. For details, see [TLS configurations](#).

Privileges

Non-superuser, one of the following:

- Ownership of the certificate
- [DROP](#) privileges on the [private key](#) (when used with DROP KEY...CASCADE)

Examples

Drop `server_cert`, if it exists:

```
=> DROP CERTIFICATE server_cert;  
DROP CERTIFICATE;
```

Drop a CA certificate and its dependencies (typically the certificates that it has signed):

```
=> DROP CERTIFICATE ca_cert CASCADE;  
DROP CERTIFICATE;
```

See also

- [CREATE CERTIFICATE](#)
- [DROP KEY](#)

DROP DATA LOADER

DROP DATA LOADER drops a data loader created with [CREATE DATA LOADER](#). It also drops the associated monitoring table.

If the data loader was created with a [trigger](#), you must disable it before dropping it. Call [ALTER DATA LOADER](#) with the DISABLE option.

Syntax

```
DROP DATA LOADER [ IF EXISTS ] [schema.]name
```

Arguments

IF EXISTS

Do not report an error if the data loader does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

schema

Schema containing the data loader. The default schema is `public`.

name

Name of the data loader.

Privileges

Non-superuser: owner or DROP privilege on the data loader.

See also

- [Automatic load](#)
- [CREATE DATA LOADER](#)
- [ALTER DATA LOADER](#)
- [EXECUTE DATA LOADER](#)

DROP DIRECTED QUERY

Removes a directed query from the database. If the directed query is active, Vertica deactivates it before removal.

Syntax

```
DROP DIRECTED QUERY { query-name | where-clause }
```

Arguments

query-name

Name of the directed query to remove from the database, as stored in the [DIRECTED_QUERIES](#) column `query_name`. You can also use [GET DIRECTED QUERY](#) to obtain names of all directed queries that map to an input query.

where-clause

Resolves to one or more directed queries that are filtered from system table [DIRECTED_QUERIES](#). For example, the following statement specifies to drop all directed queries with the same `save_plans_version` identifier:

```
=> DROP DIRECTED QUERY WHERE save_plans_version = 21;
```

Privileges

[Superuser](#)

Examples

See [Managing directed queries](#).

DROP FAULT GROUP

Removes the specified fault group and its child fault groups, placing all nodes under the parent of the dropped fault group.

To drop all fault groups, use [ALTER DATABASE..DROP ALL FAULT GROUP](#).

To add an orphaned node back to a fault group, you must manually reassign it to a new or existing fault group with [CREATE FAULT GROUP](#) and [ALTER FAULT GROUP...ADD NODE](#).

Tip

For a list of all fault groups defined in the cluster, query system table [FAULT_GROUPS](#).

Syntax

```
DROP FAULT GROUP [ IF EXISTS ] fault-group
```

Parameters

IF EXISTS

Specifies not to report an error if *fault-group* does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

fault-group

Specifies the name of the fault group to drop.

Privileges

Superuser

Examples

```
=> DROP FAULT GROUP group2;  
DROP FAULT GROUP
```

See also

- [Fault groups](#)
- [High availability with fault groups](#)
- [CLUSTER_LAYOUT](#)

DROP FILTER

Drops a User Defined Load Filter function from the Vertica catalog.

Syntax

```
DROP FILTER [[database.]schema.]filter()
```

Parameters

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

filter ()

Specifies the filter function to drop. You must append empty parentheses to the function name.

Privileges

Non-superuser:

- Owner or [DROP privilege](#)
- USAGE privilege on schema

Examples

The following command drops the [lconverter](#) filter function::

```
=> drop filter lconverter();  
DROP FILTER
```

See also

- [ALTER FUNCTION \(scalar\)](#)
- [CREATE FILTER](#)
- [USER_FUNCTIONS](#)
- [User-defined load \(UDL\)](#)

DROP FUNCTION

Drops an SQL function or user-defined functions (UDFs) from the Vertica catalog.

Syntax

```
DROP FUNCTION [ IF EXISTS ] [[database.]schema.]function[...] ( [ arg-list ] )
```

Parameters

IF EXISTS

Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

function

The SQL or user-defined function (UDF) to drop, where UDFs can be one of the following types:

- Scalar function ([UDSF](#))
- Analytic function ([UDAnF](#))
- Load ([UDL](#)) functions: [source](#), [filter](#), and [parser](#)

Note

You drop aggregate and transformation functions with [DROP AGGREGATE FUNCTION](#) and [DROP TRANSFORM FUNCTION](#), respectively.

arg-list

A comma-delimited list of arguments as defined for this function when it was created, specified as follows:

[*arg-name*] *arg-type* [...]

where *arg-name* optionally qualifies *arg-type* :

- *arg-name* is typically a column name.
- *arg-type* is the name of an [SQL data type](#) supported by Vertica.

Privileges

Non-superuser, one of the following:

- Owner or [DROP privilege](#)
- USAGE privilege on schema

Requirements

- To drop a function, you must specify the argument types because several functions might share the same name with different parameters.
- Vertica does not check for dependencies when you drop a SQL function, so if other objects reference it (such as views or other SQL functions), Vertica returns an error only when those objects are used.

Examples

The following command drops the `zerowhennull` function in the `macros` schema:

```
=> DROP FUNCTION macros.zerowhennull(x INT);  
DROP FUNCTION
```

See also

DROP KEY

Drops a cryptographic key and its certificate, if any, from the database.

To view existing cryptographic keys, query [CRYPTOGRAPHIC_KEYS](#).

Syntax

```
DROP KEY [ IF EXISTS ] key-name [...] [ CASCADE ]
```

Parameters

IF EXISTS

Vertica does not report an error if the key to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

key-name

The name of the cryptographic key to drop.

CASCADE

Drops dependent objects before dropping the key.

Predefined TLS Configurations and TLS Configurations that manage a connection type cannot be [dropped](#), nor can the keys and certificates referenced by such TLS Configurations. For details, see [TLS configurations](#).

Privileges

Non-superuser, one of the following:

- Ownership of the key
- DROP privileges

Examples

Drop `k_ca`, if it exists:

```
=> DROP KEY k_ca IF EXISTS;  
DROP KEY;
```

Drop `k_client` and its dependencies (the certificate it's associated with):

```
=> DROP KEY k_client CASCADE;  
DROP KEY;
```

See also

- [CREATE KEY](#)
- [DROP CERTIFICATE](#)

DROP LIBRARY

Removes a UDX library from the database. The library file is deleted from managed directories on the Vertica nodes. The user-defined functions (UDFs) in the library are no longer available. See [Developing user-defined extensions \(UDxs\)](#) for details.

Syntax

```
DROP LIBRARY [ IF EXISTS ] [[database.]schema.]library [ CASCADE]
```

Arguments

IF EXISTS

Execute this command only if the library exists. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

[*database.*] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

library

The name of the library to drop, the same name used in [CREATE LIBRARY](#) to load the library.

CASCADE

Also drop any functions that were defined using the library. DROP LIBRARY fails if CASCADE is omitted and one or more UDXs use the target library.

Privileges

One of:

- Superuser
- [UDXDEVELOPER](#) and library owner (the user who created it with CREATE LIBRARY)
- [UDXDEVELOPER](#) and DROP grant on the library (see [GRANT \(library\)](#))

Examples

A superuser can drop any library:

```
=> DROP LIBRARY ml.MyLib CASCADE;
```

Users with the UDXDEVELOPER role can drop libraries that they created:

```
=> GRANT UDXDEVELOPER TO alice, bob;
GRANT ROLE

=> \c - alice;
You are now connected as user "alice".

-- Must enable the role before using:
=> SET ROLE UDXDEVELOPER;
SET

-- Create and use ml.mylib...

-- Drop library and dependencies:
DROP LIBRARY ml.mylib CASCADE;
DROP LIBRARY
```

A user can be granted explicit permission to drop a library:

```
=> \c - alice
You are now connected as user "alice".

=> GRANT DROP ON LIBRARY ml.mylib to bob;
GRANT PRIVILEGE

=> \c - bob
You are now connected as user "bob".

=> SET ROLE UDXDEVELOPER;
SET

=> DROP LIBRARY ml.mylib cascade;
DROP LIBRARY
```

DROP LOAD BALANCE GROUP

Deletes a load balancing group.

Syntax

```
DROP LOAD BALANCE GROUP [ IF EXISTS ] group_name [ CASCADE ]
```

Parameters

IF EXISTS

Specifies not to report an error if the load balance group to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

group_name

The name of the group to drop.

[CASCADE]

Also drops all load balancing routing rules that target this group. If you do not supply this keyword and one or more routing rules target *group_name*, this statement fails with an error message.

Privileges

Superuser

Examples

The following statement demonstrates the error you get if the load balancing group has a dependent routing rule, and the use of the CASCADE keyword:

```
=> DROP LOAD BALANCE GROUP group_all;
NOTICE 4927: The RoutingRule catch_all depends on LoadBalanceGroup group_all
ROLLBACK 3128: DROP failed due to dependencies
DETAIL:  Cannot drop LoadBalanceGroup group_all because other objects depend on it
HINT:  Use DROP ... CASCADE to drop the dependent objects too

=> DROP LOAD BALANCE GROUP group_all CASCADE;
DROP LOAD BALANCE GROUP
```

See also

DROP MODEL

Removes one or more models from the Vertica database.

Syntax

```
DROP MODEL [ IF EXISTS ] [[database.]schema.]model[,...]
```

Parameters

IF EXISTS

Specifies not to report an error if the models to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

[*database* .] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

model

The model to drop.

Privileges

One of the following:

- Superuser
- Non-superuser: model owner

Examples

See [Dropping models](#).

DROP NAMESPACE

Eon Mode only

Drops a [namespace](#) from an Eon Mode database. The statement errors if there are any schemata or tables in the namespace.

Syntax

```
DROP NAMESPACE [ IF EXISTS ] name
```

Arguments

IF EXISTS

Do not report an error if the namespace does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

name

Name of the namespace to drop. You cannot drop the [default_namespace](#) .

Privileges

Superuser

Examples

Drop the [analytics](#) namespace:

```
=> DROP NAMESPACE 'analytics';  
DROP NAMESPACE
```

See also

- [CREATE NAMESPACE](#)
- [Managing namespaces](#)

DROP NETWORK ADDRESS

Deletes a network address from the catalog. A network address is a name for a IP address and port on a node for use in connection load balancing policies.

Syntax

```
DROP NETWORK ADDRESS [ IF EXISTS ] address-name [ CASCADE ]
```

Parameters

IF EXISTS

Specifies not to report an error if the network address to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

address-name

Name of the network address to drop.

CASCADE

Removes the network address from any load balancing groups that target it. If you do not supply this keyword and one or more load balance groups include this address, this statement fails with an error message.

Privileges

Superuser

Examples

The following statement demonstrates the error you get if the network address has a dependent load balance group, and the use of the CASCADE keyword:

```
=> DROP NETWORK ADDRESS node01;  
NOTICE 4927: The LoadBalanceGroup group_1 depends on NetworkInterface node01  
NOTICE 4927: The LoadBalanceGroup group_random depends on NetworkInterface node01  
ROLLBACK 3128: DROP failed due to dependencies  
DETAIL: Cannot drop NetworkInterface node01 because other objects depend on it  
HINT: Use DROP ... CASCADE to drop the dependent objects too  
=> DROP NETWORK ADDRESS node01 CASCADE;  
DROP NETWORK ADDRESS
```

DROP NETWORK INTERFACE

Removes a network interface from Vertica. You can use the CASCADE option to also remove the network interface from any node definition. (See [Identify the database or nodes used for import/export](#) for more information.)

Syntax

```
DROP NETWORK INTERFACE [ IF EXISTS ] network-interface-name [ CASCADE ]
```

Parameters

The parameters are defined as follows:

IF EXISTS

Specifies not to report an error if the network interface to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

network-interface-name

The network interface to remove.

CASCADE

Removes the network interface from all node definitions.

Privileges

Superuser

Examples

```
=> DROP NETWORK INTERFACE myNetwork;
```

DROP NOTIFIER

Drops a push-based notifier created by [CREATE NOTIFIER](#).

Syntax

```
DROP NOTIFIER [ IF EXISTS ] notifier-name [ CASCADE ]
```

Parameters

IF EXISTS

Specifies not to report an error if notifier to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

notifier-name

The notifier's unique identifier.

CASCADE

Removes the notifier from any data collector (DC) table policies before dropping the notifier. If the notifier is set for a DC table and CASCADE is not specified, the DROP command fails.

To manually remove the notifier from DC table policies, use the [SET_DATA_COLLECTOR_NOTIFY_POLICY](#) function.

Examples

Drop the `requests_issued` notifier, specifying CASCADE to remove it from any DC table policies:

```
DROP NOTIFIER requests_issued CASCADE;
```

DROP PARSER

Drops a User Defined Load Parser function from the Vertica catalog.

Syntax

```
DROP PARSER[[database.]schema.]parser()
```

Parameters

[*database* .] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

parser ()

The name of the parser function to drop. You must append empty parentheses to the function name.

Privileges

Non-superuser:

- Owner or [DROP privilege](#)
- USAGE privilege on schema

Examples

```
=> DROP PARSER BasicIntegerParser();  
DROP PARSER
```

See also

- [ALTER FUNCTION \(scalar\)](#)
- [CREATE PARSER](#)
- [GRANT \(User Defined Extension\)](#)
- [REVOKE \(User Defined Extension\)](#)
- [USER_FUNCTIONS](#)
- [User-defined load \(UDL\)](#)

DROP PROCEDURE (external)

Enterprise Mode only

Removes an external procedure from Vertica. Only the reference to the procedure inside Vertica is removed. The external file remains in the *database / procedures* directory of each database node.

Syntax

```
DROP PROCEDURE [ IF EXISTS ] [[database.]schema.]procedure( [ parameter-list ] )
```

Parameters

IF EXISTS

Specifies not to report an error if the procedure to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

procedure

Specifies the procedure to drop.

parameter-list

A comma-delimited list of formal parameters defined for this procedure, specified as follows:

[*parameter-name*] *parameter-type* [...]

where *parameter-name* optionally qualifies *parameter-type*.

Privileges

Non-superuser:

- Owner or [DROP privilege](#)
- USAGE privilege on schema

Examples

```
=> DROP PROCEDURE helloplanet(arg1 varchar);
```

See also

[CREATE PROCEDURE \(external\)](#)

DROP PROCEDURE (stored)

Drops a [stored procedure](#).

Syntax

```
DROP PROCEDURE [ IF EXISTS ] [[database.]schema.]procedure( [ parameter-type-list ] ) [ CASCADE ];
```

Parameters

IF EXISTS

Specifies not to report an error if the procedure to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent

objects before attempting to create them.

[*database* .] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

procedure

The name of the stored procedure, where *procedure* conforms to conventions described in [Identifiers](#).

parameter-type-list

A comma-delimited list of the [IN and INOUT](#) parameters' types.

CASCADE

[Drops](#) the trigger that references the stored procedure, if any.

Privileges

Non-superuser:

- Owner or DROP privilege
- USAGE privilege on schema

Examples

Given the following procedure:

```
=> CREATE PROCEDURE raiseXY(IN x INT, y VARCHAR) LANGUAGE PLvSQL AS $$
BEGIN
  RAISE NOTICE 'x = %', x;
  RAISE NOTICE 'y = %', y;
  -- some processing statements
END;
$$;

CALL raiseXY(3, 'some string');
NOTICE 2005: x = 3
NOTICE 2005: y = some string
```

You can drop it with:

```
=> DROP PROCEDURE raiseXY(INT, VARCHAR);
DROP PROCEDURE
```

For details on RAISE NOTICE, see [Errors and diagnostics](#).

See also

- [CREATE PROCEDURE \(stored\)](#)
- [DROP PROCEDURE \(external\)](#)

DROP PROFILE

Removes a user-defined profile (created by [CREATE PROFILE](#)) from the database. You cannot drop the `DEFAULT` profile.

Syntax

```
DROP PROFILE [ IF EXISTS ] profile-name[...] [ CASCADE ]
```

Parameters

IF EXISTS

Specifies not to report an error if the profile to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

profile-name

The profile to drop.

CASCADE

Moves all users assigned to the dropped profiles to the `DEFAULT` profile. If you omit this option and a targeted profile has users assigned to it, Vertica returns an error.

Privileges

Superuser

Examples

```
=> DROP PROFILE sample_profile;
```

DROP PROJECTION

Marks a [projection](#) to drop from the catalog so it is unavailable to user queries.

Syntax

```
DROP PROJECTION [ IF EXISTS ] { [[database.]schema.]projection[,...] } [ RESTRICT | CASCADE ]
```

Parameters

IF EXISTS

Specifies not to report an error if the projection to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

[*database.*] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

projection

Specifies a projection to drop:

- If the projection is unsegmented, all projection replicas in the database cluster are dropped.
- If the projection is segmented, drop all buddy projections by specifying the projection base name. You can also specify the name of a specific buddy projection as long as dropping it so does not violate system [K-safety](#).

See [Projection naming](#) for projection name conventions.

RESTRICT | CASCADE

Specifies whether to drop the projection when it contains objects:

- **RESTRICT** (default): Drop the projection only if it contains no objects.
- **CASCADE**: Drop the projection even if it contains objects.

Privileges

Non-superuser: owner of the anchor table

Restrictions

The following restrictions apply to dropping a projection:

- The projection cannot be the anchor table's [superprojection](#).
- You cannot drop a buddy projection if doing so violates system [K-safety](#).
- Another projection must be available to enforce the same primary or unique key constraint.

See also

- [CREATE PROJECTION](#)
- [GET PROJECTIONS](#)

DROP RESOURCE POOL

Drops a user-created resource pool. All memory allocated to the pool is returned to the [GENERAL pool](#).

Syntax

```
DROP RESOURCE POOL resource-pool [ FOR { SUBCLUSTER subcluster | CURRENT SUBCLUSTER } ]
```

Parameters

resource-pool

Name of the resource pool to drop.

FOR {SUBCLUSTER *subcluster* | CURRENT SUBCLUSTER}

Eon Mode only, drops *resource-pool* from the specified subcluster, one of the following:

- **SUBCLUSTER *subcluster***: Drops *resource-pool* from the named subcluster. You cannot be connected to this subcluster, otherwise Vertica returns an error.
- **CURRENT SUBCLUSTER**: Drops *resource-pool* from the subcluster you are connected to.

If you omit this parameter, the resource pool is dropped from all subclusters. If a resource pool was created for an individual subcluster, you

must explicitly drop it from that subcluster with this parameter; otherwise, Vertica returns an error.

Privileges

Superuser

Resource pool transfers

Requests that are queued against the dropped pool are transferred to the GENERAL pool according to the priority of the pool compared to the GENERAL pool. If the pool's priority is higher than the GENERAL pool, the requests are placed at the head of the queue; otherwise, transferred requests are placed at the end of the queue.

Users who are assigned to the dropped pool are reassigned to the default user resource pool as set by `DefaultResourcePoolForUser`. The DROP request returns with a notice like this:

```
NOTICE: Switched the following users to the <name> pool: <username>
```

If any user lacks permission to use the default user resource pool, Vertica rolls back the drop operation.

Existing sessions are transferred to the GENERAL pool regardless of whether the session user has privileges to use that pool. This can result in additional user privileges if access to the dropped pool is more restrictive than the GENERAL pool. In this case, you can prevent giving users additional privileges as follows:

1. [Revoke permissions on the target resource pool](#) from all users.
2. Close any sessions that had permissions on the resource pool.
3. Drop the resource pool.

Restrictions

- If you try to drop a resource pool that is the secondary pool for another resource pool, Vertica returns an error. The error lists the resource pools that depend on the secondary pool you tried to drop. To drop a secondary resource pool, first set the `CASCADE TO` parameter to `DEFAULT` on the primary resource pool, and then drop the secondary pool.

For example, you can drop resource pool `rp2`, which is a secondary pool for `rp1`, as follows:

```
=> ALTER RESOURCE POOL rp1 CASCADE TO DEFAULT;
=> DROP RESOURCE POOL rp2;
```

- You cannot drop a resource pool that is configured as the default user resource pool by the `DefaultResourcePoolForUsers` parameter.

Examples

Drop a user-defined resource pool:

```
=> DROP RESOURCE POOL ceo_pool;
```

Get the name of the current subcluster for an Eon Mode database, then drop its resource pool:

```
=> SELECT CURRENT_SUBCLUSTER_NAME();
CURRENT_SUBCLUSTER_NAME
-----
analytics_1
(1 row)

=> DROP RESOURCE POOL dashboard FOR CURRENT SUBCLUSTER;
DROP RESOURCE POOL
```

See also

- [ALTER RESOURCE POOL](#)
- [CREATE RESOURCE POOL](#)
- [Managing workloads](#)

DROP ROLE

Removes a role from the database.

Note

You cannot use DROP ROLE on a role added to the Vertica database with the LDAPLink service.

Syntax

```
DROP ROLE [ IF EXISTS ] role-name[,...] [ CASCADE ]
```

Parameters

IF EXISTS

Specifies not to report an error if the roles to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

role-name

The name of the role to drop

CASCADE

Revoke the role from users and other roles before dropping the role

Privileges

Superuser

Examples

```
=> DROP ROLE appadmin;  
NOTICE: User bob depends on Role appadmin  
ROLLBACK: DROP ROLE failed due to dependencies  
DETAIL: Cannot drop Role appadmin because other objects depend on it  
HINT: Use DROP ROLE ... CASCADE to remove granted roles from the dependent users/roles  
=> DROP ROLE appadmin CASCADE;  
DROP ROLE
```

See also

- [ALTER ROLE](#)
- [CREATE ROLE](#)

DROP ROUTING RULE

Deletes a routing rule from the catalog.

Syntax

```
DROP ROUTING RULE [ IF EXISTS ] { rule_name | FOR WORKLOAD workload_name }
```

Parameters

IF EXISTS

Specifies not to report an error if the routing rule to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

rule_name

Name of the rule to drop.

workload_name

The name of a [workload](#).

Privileges

Superuser

Examples

To drop a routing rule:

```
=> DROP ROUTING RULE internal_clients;  
DROP ROUTING RULE
```

To drop a rule for a workload:

```
=> DROP ROUTING RULE FOR WORKLOAD analytics;
```

See also

- [CREATE ROUTING RULE](#)
- [ALTER ROUTING RULE](#)

DROP SCHEDULE

Drops [schedules](#) .

Syntax

```
DROP SCHEDULE [(database.)schema.]schedule[,...] [ CASCADE ]
```

Parameters

[*database* .] *schema*

Database and [schema](#) . The default schema is [public](#) . If you specify a database, it must be the current database.

schedule

The schedule to drop.

CASCADE

Drops triggers that use this schedule, if any.

Privileges

Superuser

Examples

```
=> DROP SCHEDULE monthly_schedule;
```

DROP SCHEMA

Permanently removes a schema from the database. Be sure that you want to remove the schema before you drop it, because DROP SCHEMA is an irreversible process. Use the CASCADE parameter to drop a schema containing one or more objects.

Syntax

```
DROP SCHEMA [ IF EXISTS ] [{namespace . | database .}]schema[,...] [ CASCADE | RESTRICT ]
```

Parameters

IF EXISTS

Specifies not to report an error if the schemas to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

{ *namespace* . | *database* . }

Name of the database or [namespace](#) that contains *schema* , depending on the mode of the database:

- Eon Mode: name of the namespace to which *schema* belongs. If unspecified, the namespace is assumed to be [default_namespace](#) .
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#) .

CASCADE

Specifies to drop the schema and all objects in it, regardless of who owns those objects.

Caution

Objects in other schemas that depend on objects in the dropped schema—for example, user-defined functions—also are silently dropped.

RESTRICT

Drops the schema only if it is empty (default).

Privileges

Non-superuser: schema owner

Restrictions

- You cannot drop the PUBLIC schema.
- If a user is accessing an object within a schema that is in the process of being dropped, the schema is not deleted until the transaction completes.
- Canceling a DROP SCHEMA statement can cause unpredictable results.

Examples

The following example drops schema S1 only if it doesn't contain any objects:

```
=> DROP SCHEMA S1;
```

The following example drops schema S1 whether or not it contains objects:

```
=> DROP SCHEMA S1 CASCADE;
```

DROP SEQUENCE

Removes the specified named sequence number generator.

Syntax

```
DROP SEQUENCE [ IF EXISTS ] [[database.]schema.]sequence[,...]
```

Parameters

IF EXISTS

Specifies not to report an error if the sequences to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

sequence

Name of the sequence to drop.

Privileges

Non-superusers: sequence or schema owner

Restrictions

- For sequences specified in a table's default expression, the default expression fails the next time you try to load data. Vertica does not check for these instances.
- **DROP SEQUENCE** does not support the **CASCADE** keyword. Sequences used in a default expression of a column cannot be dropped until all references to the sequence are removed from the default expression.

Examples

The following command drops the sequence named [sequential](#).

```
=> DROP SEQUENCE sequential;
```

See also

- [ALTER SEQUENCE](#)
- [CREATE SEQUENCE](#)
- [CURRVAL](#)
- [GRANT \(sequence\)](#)
- [NEXTVAL](#)
- [Sequences](#)

DROP SOURCE

Drops a User Defined Load Source function from the Vertica catalog.

Syntax

```
DROP SOURCE [[database.]schema.]source()
```

Parameters

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

source ()

Specifies the source function to drop. You must append empty parentheses to the function name.

Privileges

Non-superuser:

- Owner or [DROP privilege](#)
- USAGE privilege on schema

Examples

The following command drops the `curl` source function:

```
=> DROP SOURCE curl();  
DROP SOURCE
```

See also

- [ALTER FUNCTION \(scalar\)](#)
- [CREATE SOURCE](#)
- [GRANT \(User Defined Extension\)](#)
- [REVOKE \(User Defined Extension\)](#)
- [USER_FUNCTIONS](#)
- [User-defined load \(UDL\)](#)

DROP SUBNET

Removes a subnet from Vertica.

Caution

Before removing a subnet, be sure your database is not configured to [allow export on the public subnet](#).

Syntax

```
DROP SUBNET [ IF EXISTS ] subnet-name[...] [ CASCADE ]
```

Parameters

The parameters are defined as follows:

IF EXISTS

Specifies not to report an error if the subnets to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

subnet-name

A subnet to remove.

CASCADE

Removes the specified subnets from all database definitions.

Privileges

Superuser

Examples

```
=> DROP SUBNET mySubnet;
```

See also

[Identify the database or nodes used for import/export](#)

DROP TABLE

Removes one or more tables and their [projections](#). When you run `DROP TABLE`, the change is auto-committed.

Syntax

```
DROP TABLE [ IF EXISTS ] [{ namespace. | database. } schema.] table[...] [ CASCADE ]
```

Parameters

IF EXISTS

Specifies not to report an error if one or more of the tables to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

{ *namespace*. | *database*. }

Name of the database or [namespace](#) that contains *table*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be `default_namespace`.

- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default `public`. If you specify the namespace or database name, you must provide the schema name, even if the schema is `public`.

table

The table to drop.

CASCADE

Specifies to drop all projections of the target tables. `CASCADE` is optional if the target tables have only [auto-projections](#). If you omit this option and any of the tables has non-superprojections, Vertica returns an error and rolls back the entire drop operation.

This option is not valid for external tables.

Privileges

Non-superuser:

- Table: owner, or [DROP privilege](#)
- Table schema: owner, or [USAGE privilege](#)

Requirements

- Do not cancel an executing `DROP TABLE`. Doing so can leave the database in an inconsistent state.
- Check that the target table is not in use, either directly or indirectly—for example, in a view.
- If you drop and restore a table that is referenced by a view, the new table must have the same name and column definitions.

Examples

See [Dropping tables](#)

See also

- [DROP PROJECTION](#)
- [TRUNCATE TABLE](#)

DROP TEXT INDEX

Drops a text index used to perform text searches.

Note

When a source table is dropped that has a text index associated with it, the text index is also dropped.

Syntax

```
DROP TEXT INDEX [ IF EXISTS ] [[database.]schema].idx-table
```

Parameters

IF EXISTS

Specifies not to report an error if the text index to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

[*database* .] *schema*

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

idx-table

Specifies the text index name. When using more than one schema, specify the schema that contains the index in the `DROP TEXT INDEX` statement.

Privileges

- `dbadmin`
- Table owner
- DROP privileges on the source table

Examples

```
=> DROP TEXT INDEX t_text_index;  
DROP INDEX
```

See also

- [Using text search](#)
- [CREATE TEXT INDEX](#)

DROP TLS CONFIGURATION

Drops an [existing](#) TLS Configuration.

You cannot drop a TLS Configuration if it set as a [configuration parameter](#). For details, see [TLS configurations](#).

Syntax

```
DROP TLS CONFIGURATION tls_config_name
```

Parameters

tls_config_name

The name of the TLS Configuration object to drop.

Privileges

Non-superuser, one of the following:

- [Ownership](#) of the TLS Configuration
- [DROP](#) privileges

DROP TRANSFORM FUNCTION

Drops a user-defined transform function (UDTF) from the Vertica catalog.

Syntax

```
DROP TRANSFORM FUNCTION [ IF EXISTS ] [[database.]schema.]function( [ arg-list ] )
```

Parameters

IF EXISTS

Specifies not to report an error if the function to drop does not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

function

Specifies the transform function to drop.

arg-list

A comma-delimited list of arguments as defined for this function when it was created, specified as follows:

[*arg-name*] *arg-type* [...]

where *arg-name* optionally qualifies *arg-type* :

- *arg-name* is typically a column name.
- *arg-type* is the name of an [SQL data type](#) supported by Vertica.

Note

You can omit *arg-list* when dropping a polymorphic function.

Privileges

One of the following:

- [Superuser](#)
- Schema or function owner

Examples

The following command drops the `tokenize` UDTF in the `macros` schema:

```
=> DROP TRANSFORM FUNCTION macros.tokenize(vvarchar);  
DROP TRANSFORM FUNCTION
```

The following command drops the `Pagerank` polymorphic function in the `online` schema:

```
=> DROP TRANSFORM FUNCTION online.Pagerank();  
DROP TRANSFORM FUNCTION
```

See also

[CREATE TRANSFORM FUNCTION](#)

[DROP TRIGGER](#)

Drops [triggers](#). Dropping a trigger disables its associated [schedule](#), if any.

Syntax

```
DROP TRIGGER [[database.]schema.]trigger[,...]
```

Parameters

[***database.***] ***schema***

Database and [schema](#). The default schema is `public`. If you specify a database, it must be the current database.

trigger

The trigger to drop.

Privileges

Superuser

Examples

To drop a trigger:

```
=> DROP TRIGGER revoke_trigger;
```

DROP USER

Removes a name from the list of authorized database users.

Note

DROP USER can not remove a user that was added to the Vertica database with the LDAPLink service.

Syntax

```
DROP USER [ IF EXISTS ] user-name[,...] [ CASCADE ]
```

Parameters

IF EXISTS

Do not report an error if the users to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

user-name

Name of a user to drop.

CASCADE

Drop all user-defined objects created by *user-name*, including schemas, tables and all views that reference the table, and projections of that table.

Caution

Tables owned by the dropped user cannot be recovered after you issue DROP USER CASCADE.

Privileges

Superuser

Examples

DROP USER succeeds if no user-defined objects exist:

```
=> CREATE USER user2;  
CREATE USER  
=> DROP USER IF EXISTS user2;  
DROP USER
```

DROP USER fails if objects that the user created still exist:

```
=> DROP USER IF EXISTS user1;  
NOTICE: Table T_tbd1 depends on User user1  
ROLLBACK: DROP failed due to dependencies  
DETAIL: Cannot drop User user1 because other objects depend on it  
HINT: Use DROP ... CASCADE to drop the dependent objects too
```

DROP USER CASCADE succeeds regardless of any existing user-defined objects. The statement forcibly drops all user-defined objects, such as schemas, tables and their associated projections:

```
=> DROP USER IF EXISTS user1 CASCADE;  
DROP USER
```

See also

- [ALTER USER](#)
- [CREATE USER](#)

DROP VIEW

Removes the specified view. Vertica does not check for dependencies on the dropped view. After dropping a view, other views that reference it fail.

If you drop a view and replace it with another view or table with the same name and column names, other views that reference that name use the new view. If you change the column data type in the new view, the server coerces the old data type to the new one if possible; otherwise, it returns an error.

Syntax

```
DROP VIEW [ IF EXISTS ] [[database.]schema.]view[,...]
```

Parameters

IF EXISTS

Specifies not to report an error if the views to drop do not exist. Use this clause in SQL scripts to avoid errors on dropping non-existent objects before attempting to create them.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

view

Name of a view to drop.

Privileges

One of the following

- View owner and USAGE privileges
- Schema owner

Examples

```
=> DROP VIEW myview;
```

END

Ends the current transaction and makes all changes that occurred during the transaction permanent and visible to other users.

Note

[COMMIT](#) is a synonym for END.

Syntax

```
END [ WORK | TRANSACTION ]
```

Parameters

WORK | TRANSACTION

Optional keywords that have no effect, for readability only.

Privileges

None

Examples

```
=> BEGIN TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
BEGIN
=> CREATE TABLE sample_table (a INT);
CREATE TABLE
=> INSERT INTO sample_table (a) VALUES (1);
OUTPUT
-----
1
(1 row)
=> END;
COMMIT
```

See also

- [Transactions](#)
- [Creating and rolling back transactions](#)
- [BEGIN](#)
- [ROLLBACK](#)
- [START TRANSACTION](#)

EXECUTE DATA LOADER

EXECUTE DATA LOADER executes a data loader created with [CREATE DATA LOADER](#). It attempts to load all files in the specified location that have not already been loaded and that have not reached the retry limit. By default, executing the loader commits the transaction.

Data loaders are executed with COPY ABORT ON ERROR.

EXECUTE DATA LOADER records events in the [DATA_LOADER_EVENTS](#) system table.

EXECUTE DATA LOADER runs the data loader once. To execute it periodically, you can use a [scheduled stored procedure](#). To suspend execution, call [ALTER DATA LOADER](#) with the **DISABLE** option.

Syntax

```
EXECUTE DATA LOADER [schema.]name
 [ WITH FILES file [{ EXACT_PATH | EXPAND_GLOB }][,...] ]
 [ FORCE RETRY ]
 [ BATCH_SIZE { 'size{K|M|G|T}' | '0' | 'UNLIMITED' } ]
 [ NO COMMIT ]
```

Arguments

schema

Schema containing the data loader. The default schema is **public**.

name

Name of the data loader.

WITH FILES *file*

Load only the specified files from the data loader's COPY path. Files that do not also match the COPY path are ignored. Files that have already been loaded are not reloaded. Both of these events are recorded in the loader's associated monitoring table.

EXACT_PATH | EXPAND_GLOB

How to match the named file:

- **EXACT_PATH** (default): file names must match exactly. Any special characters in the file name are treated as literal parts of the name. For example, `sales*.parquet` specifies a single file whose name includes the `*` character.
- **EXPAND_GLOB**: glob characters in file names are interpreted as globs. For example, `sales*.parquet` specifies one or more Parquet files beginning with `sales`.

FORCE_RETRY

Ignore the retry limit.

BATCH_SIZE { 'size {K|M|G|T}' | '0' | 'UNLIMITED' }

When dividing a load for parallel execution, override the Vertica default and set the target total size of files to include in one batch. This value is a hint and batches could be larger, depending on the sizes of individual files.

If this option is omitted, Vertica chooses a size based on the total data volume and the number of executor nodes. The maximum batch size that Vertica automatically chooses is 10GB on each node, but you can specify a larger value with this option.

To set a target size, specify an integer with a unit of measure, such as `'100M'` or `'2G'`. To disable batch loads and load files one at a time, specify `'0'`. To load all files in a single batch, specify `'UNLIMITED'`.

NO_COMMIT

Do not commit the transaction after execution. Use when execution is part of an operation that must be atomic. SQS triggers use this option so that execution and queue management are part of the same transaction.

Privileges

Read privileges to the source location.

Non-superuser:

- Owner or EXECUTE privilege on the data loader.
- Write privilege on the table.

Examples

Execute a data loader once:

```
-> EXECUTE DATA LOADER sales_dl;
Rows Loaded
-----
      5
(1 row)
```

Schedule a recurring execution:

```
-> CREATE SCHEDULE daily_load USING CRON '0 13 * * *';
-- statement must be quoted:
-> CREATE PROCEDURE dl_runner() as $$ begin EXECUTE 'EXECUTE DATA LOADER sales_dl'; end; $$;
-> CREATE TRIGGER t_load ON SCHEDULE daily_load EXECUTE PROCEDURE dl_runner() AS DEFINER;
```

Load specific files with globbing:

```
-- no file named '09*.dat' so nothing loaded by default:
-> EXECUTE DATA LOADER sales_dl
  WITH FILES 's3://MyBucket/sales/2023/09*.dat';
Rows Loaded
-----
      0
(1 row)

-- loads '09-01.dat', '09-02.dat', etc:
-> EXECUTE DATA LOADER sales_dl
  WITH FILES 's3://MyBucket/sales/2023/09*.dat' EXPAND_GLOB;
Rows Loaded
-----
     20
(1 row)

-- loads one glob and one specific file:
-> EXECUTE DATA LOADER sales_dl
  WITH FILES 's3://MyBucket/sales/2023/09*.dat' EXPAND_GLOB,
           's3://MyBucket/sales/2023/specials.dat' EXACT_PATH;
Rows Loaded
-----
     32
(1 row)
```

See [Automatic load](#) for an extended example.

See also

- [CREATE DATA LOADER](#)
- [ALTER DATA LOADER](#)
- [DROP DATA LOADER](#)

EXPLAIN

Returns a formatted description of the Vertica optimizer's plan for executing the specified statement.

Syntax

```
EXPLAIN [/*+ ALLNODES */] [explain-options] sql-statement
```

Parameters

/*+ [ALLNODES](#) */

Specifies to create a query plan that assumes all nodes are active, not valid with [LOCAL](#) option.

explain-options

One or more [EXPLAIN](#) options, specified in the order shown:

```
[ LOCAL ] [ VERBOSE ] [ JSON ] [ ANNOTATED ]
```

- **LOCAL** : On a multi-node database, shows the local query plans assigned to each node, which together comprise the total (global) query plan. If you omit this option, Vertica shows only the global query plan. Local query plans are shown only in DOT language source, which can be rendered in [Graphviz](#).
This option is incompatible with the hint **/*+ALLNODES*/**. If you specify both, EXPLAIN returns with an error.
- **VERBOSE** : Increases the level of detail in the rendered query plan.
- **JSON** : Renders the query plan in JSON format. This option is compatible only with **VERBOSE**.
- **ANNOTATED** : Embeds [optimizer hints](#) that encapsulate the query plan for this query. This option is compatible with **LOCAL** and **VERBOSE**.

sql-statement

A query or DML statement—for example, [SELECT](#), [INSERT](#), [UPDATE](#), [COPY](#), and [MERGE](#).

Privileges

The same privileges required by the specified statement.

Requirements

The following requirements apply to EXPLAIN's ability to produce useful information:

- Reasonably representative statistics of your data must be available. See [Collecting Statistics](#) for details.
- EXPLAIN produces useful output only if projections are available for the queried tables.
- Qualifier options must be specified in the order shown [earlier](#), otherwise EXPLAIN returns with an error. If an option is incompatible with any preceding options, EXPLAIN ignores them.

Examples

See [Viewing query plans](#).

EXPORT TO DELIMITED

Exports a table, columns from a table, or query results to delimited files. The files can be read back in using [DELIMITED](#). Several exporter parameters have corresponding parser parameters, allowing you to change delimiters, null indicators, and other formatting.

There are some limitations on the queries you can use in an export statement. See [Query Restrictions](#).

You can export data stored in Vertica in ROS format and data from external tables.

File exporters are UDxs that cannot be run in fenced mode. If the ForceUDxFencedMode configuration parameter is set to true to support other UDxs, you can set it to false at the session level before performing the export.

This statement returns the number of rows written and logs information about exported files in a system table. See [Monitoring exports](#).

During an export to HDFS or an NFS mount point, Vertica writes files to a temporary directory in the same location as the destination and renames the directory when the export is complete. Do not attempt to use the files in the temporary directory. During an export to S3, GCS, or Azure, Vertica writes files directly to the destination path, so you must wait for the export to finish before reading the files. For more information, see [Exporting to object stores](#).

Syntax

```
EXPORT [ /*+LABEL (label-string)*! ] TO DELIMITED
 ( directory='path'[ , param=value[,...] ] )
 [ OVER (over-clause) ] AS SELECT query-expression
```

Arguments

LABEL

Assigns a label to a statement to identify it for profiling and debugging.

over-clause

Specifies how to partition table data using PARTITION BY. Within partitions you can sort using ORDER BY. See [SQL analytics](#). This clause may contain column references but not expressions.

If you partition data, Vertica creates a partition directory structure, transforming column names to lowercase. See [Partitioned data](#) for a description of the directory structure. If you use the `fileName` parameter, you cannot use partitioning.

If you omit this clause, Vertica optimizes for maximum parallelism.

query-expression

Specifies the data to export. See [Query Restrictions](#) for important limitations.

Parameters

directory

The destination directory for the output files. The current user must have permission to write it. The destination can be on any of the following file systems:

- [HDFS file system](#)
- [S3 object store](#)
- [Google Cloud Storage \(GCS\) object store](#)
- [Azure Blob Storage object store](#)
- Linux file system, either an NFS mount or local storage on each node

See also: `ifDirExists`.

ifDirExists

What to do if `directory` already exists, one of:

- **fail** (default)
- **overwrite** : replace the entire directory
- **append** : export new files into the existing directory

If you specify **overwrite** for an export to an object store, the existing directory is deleted recursively at the beginning of the operation and is not restored if the operation fails. Be careful not to export to a directory containing data you want to keep. For an export to a Linux file system or HDFS, the directory is only overwritten if the export succeeds.

Do not do concurrent exports to the same directory. In particular, if you do so with a value of **overwrite** , all operations appear to succeed, but the results are incorrect.

When using **append** , be careful to use the same table schema. Otherwise, queries of external tables using this data path could fail.

filename

If specified, all output is written to a single file of this name in the location specified by **directory** . While the query can be processed by multiple nodes, only a single node generates the output data. The **fileSizeMB** parameter is ignored, and the query cannot use partitioning in the OVER() clause.

addHeader

Boolean, specifies whether to add a header row to the beginning of each file.

Default: false

delimiter

Column delimiter character. To produce CSV in accordance with RFC 4180, set the delimiter character to , (comma).

Default: | (vertical bar)

recordTerminator

Character that marks the record end.

Default: \n

enclosedBy

Character to use to enclose string and date/time data. If you omit this parameter, no character encloses these data types.

Default: " (empty string)

escapeAs

Character to use to escape values in exported data that must be escaped, including the **enclosedBy** value.

Default: \ (backslash)

nullAs

String to represent null values in the data. If this parameter is included, the exporter exports all null values as this value. Otherwise, the exporter exports null values as zero-length strings.

binaryTypesFormat

Format for exported [binary data type](#) (BINARY, VARBINARY, and LONG VARBINARY) values, one of the following:

- **Default** : Printable ASCII characters where possible and escaped octal representations of the non-printable bytes. The DELIMITED parser reads this format.
- **Hex** : Base 16 (hexadecimal) representation; value is preceded by '0x' and bytes are not escaped.
- **Octal** : Base 8 (octal) representation, without escaping.
- **Bitstring** : Binary representation, without escaping.

For example, the value `a\000b\001c` can be exported as follows:

- Default (assuming an escape character of \): `a\000b\001c`
- Hex: `0x6100620163`
- Octal: `141000142001143`
- Bitstring: `0110000100000000011000100000000101100011`

compression

Compression type, one of:

- **Uncompressed**
- **BZip**

- GZip

Default: Uncompressed

fileExtension

Output file extension. If using compression, a compression-specific extension such as `.bz2` is appended.

Default: `csv`

fileSizeMB

The maximum file size of a single output file. This value is a hint, not a hard limit. A value of 0 specifies no limit. If `filename` is also specified, `fileSizeMB` is ignored.

This value affects the size of individual output files, not the total output size. For smaller values, Vertica divides the output into more files; all data is still exported.

Default: 10GB

fileMode

For writes to HDFS only, permission to apply to all exported files. You can specify the value in Unix octal format (such as `665`) or `user - group - other` format—for example, `rwxr-xr-x`. The value must be formatted as a string even if using the octal format.

Valid octal values range between `0` and `1777`, inclusive. See [HDFS Permissions](#) in the Apache Hadoop documentation.

When writing files to any destination other than HDFS, this parameter has no effect.

Default: `660`, regardless of the value of `fs.permissions.umask-mode` in `hdfs-site.xml`.

dirMode

For writes to HDFS only, permission to apply to all exported directories. Values follow the same rules as those for `fileMode`. Further, you must give the Vertica HDFS user full permission, at least `rwX-----` or `700`.

When writing files to any destination other than HDFS, this parameter has no effect.

Default: `755`, regardless of the value of `fs.permissions.umask-mode` in `hdfs-site.xml`.

Privileges

Non-superusers:

- Source table: SELECT
- Source table schema: USAGE
- Destination directory: Write

Query restrictions

You must provide an alias column label for selected column targets that are expressions.

If you partition the output, you cannot specify schema and table names in the SELECT statement. Specify only the column name.

The query can contain only a single outer SELECT statement. For example, you cannot use UNION:

```
=> EXPORT TO DELIMITED(directory = '/mnt/shared_nfs/accounts/rm')
  OVER(PARTITION BY hash)
  AS
  SELECT 1 as account_id, '{}' as json, 0 hash
  UNION ALL
  SELECT 2 as account_id, '{}' as json, 1 hash;
ERROR 8975: Only a single outer SELECT statement is supported
HINT: Please use a subquery for multiple outer SELECT statements
```

Instead, rewrite the query to use a subquery:

```

=> EXPORT TO DELIMITED(directory = '/mnt/shared_nfs/accounts/rm')
OVER(PARTITION BY hash)
AS
SELECT
  account_id,
  json
FROM
(
  SELECT 1 as account_id, '{}' as json, 0 hash
  UNION ALL
  SELECT 2 as account_id, '{}' as json, 1 hash
) a;
Rows Exported
-----
      2
(1 row)

```

To use composite statements such as UNION, INTERSECT, and EXCEPT, rewrite them as subqueries.

Data types

EXPORT TO DELIMITED does not support ARRAY, ROW, and SET types.

This operation exports raw Flex columns as binary data.

Output

The export operation always creates (or appends to) an output directory, even if all output is written to a single file or the query produces zero rows.

Output file names follow the pattern: *prefix - nodename - threadId [- sequenceNumber]. fileExtension*. *prefix* is typically an 8-character hash, but can be longer if the export appended to an existing directory. A sequence number is added if an export needs to be broken into pieces to satisfy *fileSizeMB*.

Column names in partition directories are lowercase.

Files exported to a local file system by any Vertica user are owned by the Vertica superuser. Files exported to HDFS or object stores are owned by the Vertica user who exported the data.

Making concurrent exports to the same output destination is an error and can produce incorrect results.

Exports to the local file system can be to an NFS mount (shared) or to the Linux file system on each node (non-shared). For details, see [Exporting to the Linux file system](#). Exports to non-shared local file systems have the following restrictions:

- The output directory must not exist on any node.
- You must have a USER storage location or superuser privileges.
- You cannot override the permissions mode of 700 for directories and 600 for files.

Exports to object-store file systems are not atomic. Be careful to wait for the export to finish before using the data. For details, see [Exporting to object stores](#).

Examples

The following example exports uncompressed comma-separated values (CSV) with a header row in each file:

```

=> EXPORT TO DELIMITED(directory='webhdfs:///user1/data', delimiter=',', addHeader='true')
AS SELECT * FROM public.sales;

```

EXPORT TO JSON

Exports a table, columns from a table, or query results to JSON files. The files can be read back into Vertica using [FJSONPARSER](#).

There are some limitations on the queries you can use in an export statement. See [Query Restrictions](#).

You can export data stored in Vertica in ROS format and data from external tables.

File exporters are UDxs that cannot be run in fenced mode. If the ForceUDxFencedMode configuration parameter is set to true to support other UDxs, you can set it to false at the session level before performing the export.

This statement returns the number of rows written and logs information about exported files in a system table. See [Monitoring exports](#).

During an export to HDFS or an NFS mount point, Vertica writes files to a temporary directory in the same location as the destination and renames the directory when the export is complete. Do not attempt to use the files in the temporary directory. During an export to S3, GCS, or Azure, Vertica writes files directly to the destination path, so you must wait for the export to finish before reading the files. For more information, see [Exporting to object stores](#).

Syntax

```
EXPORT [ /*+LABEL (label)* / ] TO JSON
  ( directory='path'[ , param=value[...]] )
  [ OVER (over-clause ) ] AS SELECT query-expression
```

Arguments

LABEL

Assigns a label to a statement to identify it for profiling and debugging.

over-clause

Specifies how to partition table data using PARTITION BY. Within partitions you can sort using ORDER BY. See [SQL analytics](#). This clause may contain column references but not expressions.

If you partition data, Vertica creates a partition directory structure, transforming column names to lowercase. See [Partitioned data](#) for a description of the directory structure. If you use the `fileName` parameter, you cannot use partitioning.

If you omit this clause, Vertica optimizes for maximum parallelism.

query-expression

Specifies the data to export. See [Query Restrictions](#) for important limitations.

Parameters

directory

The destination directory for the output files. The current user must have permission to write it. The destination can be on any of the following file systems:

- [HDFS file system](#)
- [S3 object store](#)
- [Google Cloud Storage \(GCS\) object store](#)
- [Azure Blob Storage object store](#)
- Linux file system, either an NFS mount or local storage on each node

See also: [ifDirExists](#).

ifDirExists

What to do if `directory` already exists, one of:

- `fail` (default)
- `overwrite`: replace the entire directory
- `append`: export new files into the existing directory

If you specify `overwrite` for an export to an object store, the existing directory is deleted recursively at the beginning of the operation and is not restored if the operation fails. Be careful not to export to a directory containing data you want to keep. For an export to a Linux file system or HDFS, the directory is only overwritten if the export succeeds.

Do not do concurrent exports to the same directory. In particular, if you do so with a value of `overwrite`, all operations appear to succeed, but the results are incorrect.

When using `append`, be careful to use the same table schema. Otherwise, queries of external tables using this data path could fail.

filename

If specified, all output is written to a single file of this name in the location specified by `directory`. While the query can be processed by multiple nodes, only a single node generates the output data. The `fileSizeMB` parameter is ignored, and the query cannot use partitioning in the OVER() clause.

omitNullFields

Boolean, whether to omit [ROW](#) fields with null values.

Default: false

compression

Compression type, one of:

- Uncompressed
- BZip
- GZip

Default: Uncompressed

fileSizeMB

The maximum file size of a single output file. This value is a hint, not a hard limit. A value of 0 specifies no limit. If `filename` is also specified, `fileSizeMB` is ignored.

This value affects the size of individual output files, not the total output size. For smaller values, Vertica divides the output into more files; all data is still exported.

Default: 10GB

fileMode

For writes to HDFS only, permission to apply to all exported files. You can specify the value in Unix octal format (such as `665`) or `user - group - other` format—for example, `rwxr-xr-x`. The value must be formatted as a string even if using the octal format.

Valid octal values range between `0` and `1777`, inclusive. See [HDFS Permissions](#) in the Apache Hadoop documentation.

When writing files to any destination other than HDFS, this parameter has no effect.

Default: `660`, regardless of the value of `fs.permissions.umask-mode` in `hdfs-site.xml`.

dirMode

For writes to HDFS only, permission to apply to all exported directories. Values follow the same rules as those for `fileMode`. Further, you must give the Vertica HDFS user full permission, at least `rwX-----` or `700`.

When writing files to any destination other than HDFS, this parameter has no effect.

Default: `755`, regardless of the value of `fs.permissions.umask-mode` in `hdfs-site.xml`.

Privileges

Non-superusers:

- Source table: SELECT
- Source table schema: USAGE
- Destination directory: Write

Query restrictions

You must provide an alias column label for selected column targets that are expressions.

If you partition the output, you cannot specify schema and table names in the SELECT statement. Specify only the column name.

The query can contain only a single outer SELECT statement. For example, you cannot use UNION:

```
=> EXPORT TO JSON(directory = '/mnt/shared_nfs/accounts/rm')
  OVER(PARTITION BY hash)
  AS
  SELECT 1 as account_id, '{}' as json, 0 hash
  UNION ALL
  SELECT 2 as account_id, '{}' as json, 1 hash;
ERROR 8975: Only a single outer SELECT statement is supported
HINT: Please use a subquery for multiple outer SELECT statements
```

Instead, rewrite the query to use a subquery:

```

=> EXPORT TO JSON(directory = '/mnt/shared_nfs/accounts/rm')
OVER(PARTITION BY hash)
AS
SELECT
  account_id,
  json
FROM
(
  SELECT 1 as account_id, '{}' as json, 0 hash
  UNION ALL
  SELECT 2 as account_id, '{}' as json, 1 hash
) a;
Rows Exported
-----
      2
(1 row)

```

To use composite statements such as UNION, INTERSECT, and EXCEPT, rewrite them as subqueries.

Data types

EXPORT TO JSON can export [ARRAY](#) and [ROW](#) types in any combination.

EXPORT TO JSON does not support binary output (VARBINARY).

Output

The export operation always creates (or appends to) an output directory, even if all output is written to a single file or the query produces zero rows.

Output file names follow the pattern: *prefix - nodename - threadId [- sequenceNumber].json*. *prefix* is typically an 8-character hash, but can be longer if the export appended to an existing directory. A sequence number is added if an export needs to be broken into pieces to satisfy [fileSizeMB](#).

Column names in partition directories are lowercase.

Files exported to a local file system by any Vertica user are owned by the Vertica superuser. Files exported to HDFS or object stores are owned by the Vertica user who exported the data.

Making concurrent exports to the same output destination is an error and can produce incorrect results.

Exports to the local file system can be to an NFS mount (shared) or to the Linux file system on each node (non-shared). For details, see [Exporting to the Linux file system](#). Exports to non-shared local file systems have the following restrictions:

- The output directory must not exist on any node.
- You must have a USER storage location or superuser privileges.
- You cannot override the permissions mode of 700 for directories and 600 for files.

Exports to object-store file systems are not atomic. Be careful to wait for the export to finish before using the data. For details, see [Exporting to object stores](#).

Examples

In the following example, one of the ROW elements has a null value, which is omitted in the output. EXPORT TO JSON writes each JSON record on one line; line breaks have been inserted into the following output for readability:

```

=> SELECT name, menu FROM restaurants;
  name      |          menu
-----+-----
Bob's pizzeria | [{"item":"cheese pizza","price":null},{item:"spinach pizza","price":10.5}]
Bakersfield Tacos | [{"item":"veggie taco","price":9.95},{item:"steak taco","price":10.95}]
(2 rows)

=> EXPORT TO JSON (directory='/output/json', omitNullFields=true)
  AS SELECT * FROM restaurants;
  Rows Exported
-----
          2
(1 row)

=> \! cat /output/json/*.json
{"name":"Bob's pizzeria","cuisine":"Italian","location_city":["Cambridge","Pittsburgh"],
 "menu":[{"item":"cheese pizza"}, {"item":"spinach pizza","price":10.5}]}
{"name":"Bakersfield Tacos","cuisine":"Mexican","location_city":["Pittsburgh"],
 "menu":[{"item":"veggie taco","price":9.95}, {"item":"steak taco","price":10.95}]}

```

EXPORT TO ORC

Exports a table, columns from a table, or query results to files in the ORC format.

You can use an `OVER()` clause to partition the data before export. You can partition data instead of or in addition to exporting the column data. Partitioning data can improve query performance by enabling partition pruning. See [Partitioned data](#).

There are some limitations on the queries you can use in an export statement. See [Query Restrictions](#).

You can export data stored in Vertica in ROS format and data from external tables.

File exporters are UDxs that cannot be run in fenced mode. If the `ForceUDxFencedMode` configuration parameter is set to true to support other UDxs, you can set it to false at the session level before performing the export.

This statement returns the number of rows written and logs information about exported files in a system table. See [Monitoring exports](#).

During an export to HDFS or an NFS mount point, Vertica writes files to a temporary directory in the same location as the destination and renames the directory when the export is complete. Do not attempt to use the files in the temporary directory. During an export to S3, GCS, or Azure, Vertica writes files directly to the destination path, so you must wait for the export to finish before reading the files. For more information, see [Exporting to object stores](#).

Syntax

```

EXPORT [ /*+LABEL (label-string)* / ] TO ORC
  ( directory='path'[ , param=value[ , ... ] ] )
  [ OVER (over-clause) ] AS SELECT query-expression

```

Arguments

LABEL

Assigns a label to a statement to identify it for profiling and debugging.

over-clause

Specifies how to partition table data using `PARTITION BY`. Within partitions you can sort using `ORDER BY`. See [SQL analytics](#). This clause may contain column references but not expressions.

If you partition data, Vertica creates a partition directory structure, transforming column names to lowercase. See [Partitioned data](#) for a description of the directory structure. If you use the `fileName` parameter, you cannot use partitioning.

If you omit this clause, Vertica optimizes for maximum parallelism.

query-expression

Specifies the data to export. See [Query Restrictions](#) for important limitations.

Parameters

directory

The destination directory for the output files. The current user must have permission to write it. The destination can be on any of the following file systems:

- [HDFS file system](#)
- [S3 object store](#)
- [Google Cloud Storage \(GCS\) object store](#)
- [Azure Blob Storage object store](#)
- Linux file system, either an NFS mount or local storage on each node

See also: [ifDirExists](#) .

ifDirExists

What to do if **directory** already exists, one of:

- **fail** (default)
- **overwrite** : replace the entire directory
- **append** : export new files into the existing directory

If you specify **overwrite** for an export to an object store, the existing directory is deleted recursively at the beginning of the operation and is not restored if the operation fails. Be careful not to export to a directory containing data you want to keep. For an export to a Linux file system or HDFS, the directory is only overwritten if the export succeeds.

Do not do concurrent exports to the same directory. In particular, if you do so with a value of **overwrite** , all operations appear to succeed, but the results are incorrect.

When using **append** , be careful to use the same table schema. Otherwise, queries of external tables using this data path could fail.

filename

If specified, all output is written to a single file of this name in the location specified by **directory** . While the query can be processed by multiple nodes, only a single node generates the output data. The **fileSizeMB** parameter is ignored, and the query cannot use partitioning in the OVER() clause.

compression

Column compression type, one of:

- **Zlib**
- **Uncompressed**

Default: Zlib

stripeSizeMB

The uncompressed size of exported stripes in MB, an integer value between 1 and 1024, inclusive.

Default: 250

rowIndexStride

Integer that specifies how frequently the exporter builds indexing statistics in the output, between 1 and 1000000 (1 million), inclusive. A value of 0 disables indexing. The exporter builds statistics after every **rowIndexStride** rows in each stripe, or once for stripes < **rowIndexStride** .

Default: 1000

fileSizeMB

The maximum file size of a single output file. This value is a hint, not a hard limit. A value of 0 specifies no limit. If **filename** is also specified, **fileSizeMB** is ignored.

This value affects the size of individual output files, not the total output size. For smaller values, Vertica divides the output into more files; all data is still exported.

Default: 10GB

fileMode

For writes to HDFS only, permission to apply to all exported files. You can specify the value in Unix octal format (such as **665**) or **user - group - other** format—for example, **rxr-xr-x** . The value must be formatted as a string even if using the octal format.

Valid octal values range between 0 and 1777 , inclusive. See [HDFS Permissions](#) in the Apache Hadoop documentation.

When writing files to any destination other than HDFS, this parameter has no effect.

Default: 660 , regardless of the value of `fs.permissions.umask-mode` in `hdfs-site.xml` .

dirMode

For writes to HDFS only, permission to apply to all exported directories. Values follow the same rules as those for `fileMode` . Further, you must give the Vertica HDFS user full permission, at least `rwX-----` or 700 .

When writing files to any destination other than HDFS, this parameter has no effect.

Default: 755 , regardless of the value of `fs.permissions.umask-mode` in `hdfs-site.xml` .

Privileges

Non-superusers:

- Source table: SELECT
- Source table schema: USAGE
- Destination directory: Write

Query restrictions

You must provide an alias column label for selected column targets that are expressions.

If you partition the output, you cannot specify schema and table names in the SELECT statement. Specify only the column name.

The query can contain only a single outer SELECT statement. For example, you cannot use UNION:

```
=> EXPORT TO ORC(directory = '/mnt/shared_nfs/accounts/rm')
OVER(PARTITION BY hash)
AS
SELECT 1 as account_id, '{}' as json, 0 hash
UNION ALL
SELECT 2 as account_id, '{}' as json, 1 hash;
ERROR 8975: Only a single outer SELECT statement is supported
HINT: Please use a subquery for multiple outer SELECT statements
```

Instead, rewrite the query to use a subquery:

```
=> EXPORT TO ORC(directory = '/mnt/shared_nfs/accounts/rm')
OVER(PARTITION BY hash)
AS
SELECT
  account_id,
  json
FROM
(
  SELECT 1 as account_id, '{}' as json, 0 hash
  UNION ALL
  SELECT 2 as account_id, '{}' as json, 1 hash
) a;
Rows Exported
-----
      2
(1 row)
```

To use composite statements such as UNION, INTERSECT, and EXCEPT, rewrite them as subqueries.

Data types

EXPORT TO ORC converts Vertica data types to Hive data types as shown in the following table.

Vertica Data Type	Hive Data Type
INTEGER, BIGINT	BIGINT

FLOAT, DECIMAL, SMALLINT, TINYINT, CHAR, BOOLEAN	Corresponding Hive type
VARCHAR, LONG VARCHAR	VARCHAR (max 64KB) or STRING (can be read as either)
BINARY, VARBINARY, LONG VARBINARY	BINARY
DATE	DATE if supported by your version of Hive, otherwise INT96 (can be read as TIMESTAMP)
TIMESTAMP, TIMESTAMPTZ	TIMESTAMP. Vertica does not convert TIMESTAMP values to UTC. To avoid problems arising from time zones, use TIMESTAMPTZ instead of TIMESTAMP.
TIME, TIMEZ, INTERVAL, UUID	Not supported
ARRAY, SET	Not supported
ROW	Not supported

Decimal precision must be ≤ 38 .

The exported Hive types might not be identical to the Vertica types. For example, a Vertica INT is exported as a Hive BIGINT. When defining Hive external tables to read exported data, you might have to adjust column definitions.

This operation exports raw Flex columns as binary data.

Output

The export operation always creates (or appends to) an output directory, even if all output is written to a single file or the query produces zero rows.

Output file names follow the pattern: *prefix - nodename - threadId [- sequenceNumber].orc* . *prefix* is typically an 8-character hash, but can be longer if the export appended to an existing directory. A sequence number is added if an export needs to be broken into pieces to satisfy `fileSizeMB` .

Column names in partition directories are lowercase.

Files exported to a local file system by any Vertica user are owned by the Vertica superuser. Files exported to HDFS or object stores are owned by the Vertica user who exported the data.

Making concurrent exports to the same output destination is an error and can produce incorrect results.

Exports to the local file system can be to an NFS mount (shared) or to the Linux file system on each node (non-shared). For details, see [Exporting to the Linux file system](#) . Exports to non-shared local file systems have the following restrictions:

- The output directory must not exist on any node.
- You must have a USER storage location or superuser privileges.
- You cannot override the permissions mode of 700 for directories and 600 for files.

Exports to object-store file systems are not atomic. Be careful to wait for the export to finish before using the data. For details, see [Exporting to object stores](#) .

Examples

The following example demonstrates partitioning and exporting data. EXPORT TO ORC first partitions the data on region and then, within each partition, sorts by store.

```
=> EXPORT TO ORC(directory='gs://DataLake/user2/data')
OVER(PARTITION BY store.region ORDER BY store.ID)
AS SELECT sale.price, sale.date, store.ID
FROM public.sales sale
JOIN public.vendor store ON sale.distribID = store.ID;
```

For more examples, see [EXPORT TO PARQUET](#) , which (aside from a few parameters) behaves the same as EXPORT TO ORC.

EXPORT TO PARQUET

Exports a table, columns from a table, or query results to files in the Parquet format.

You can use an `OVER()` clause to partition the data before export. You can partition data instead of or in addition to exporting the column data. Partitioning data can improve query performance by enabling partition pruning. See [Partitioned data](#).

There are some limitations on the queries you can use in an export statement. See [Query Restrictions](#).

You can export data stored in Vertica in ROS format and data from external tables.

File exporters are UDxs that cannot be run in fenced mode. If the `ForceUDxFencedMode` configuration parameter is set to true to support other UDxs, you can set it to false at the session level before performing the export.

This statement returns the number of rows written and logs information about exported files in a system table. See [Monitoring exports](#).

During an export to HDFS or an NFS mount point, Vertica writes files to a temporary directory in the same location as the destination and renames the directory when the export is complete. Do not attempt to use the files in the temporary directory. During an export to S3, GCS, or Azure, Vertica writes files directly to the destination path, so you must wait for the export to finish before reading the files. For more information, see [Exporting to object stores](#).

After you export data, you can use the [GET_METADATA](#) function to inspect the results.

Syntax

```
EXPORT [ /*+LABEL (label-string)* / ] TO PARQUET
  ( directory='path'[ , param=value[...]] )
  [ OVER (over-clause) ] AS SELECT query-expression
```

Arguments

LABEL

Assigns a label to a statement to identify it for profiling and debugging.

over-clause

Specifies how to partition table data using `PARTITION BY`. Within partitions you can sort using `ORDER BY`. See [SQL analytics](#). This clause may contain column references but not expressions.

If you partition data, Vertica creates a partition directory structure, transforming column names to lowercase. See [Partitioned data](#) for a description of the directory structure. If you use the `fileName` parameter, you cannot use partitioning.

If you omit this clause, Vertica optimizes for maximum parallelism.

query-expression

Specifies the data to export. See [Query Restrictions](#) for important limitations.

Parameters

directory

The destination directory for the output files. The current user must have permission to write it. The destination can be on any of the following file systems:

- [HDFS file system](#)
- [S3 object store](#)
- [Google Cloud Storage \(GCS\) object store](#)
- [Azure Blob Storage object store](#)
- Linux file system, either an NFS mount or local storage on each node

See also: `ifDirExists`.

ifDirExists

What to do if `directory` already exists, one of:

- `fail` (default)
- `overwrite` : replace the entire directory
- `append` : export new files into the existing directory

If you specify `overwrite` for an export to an object store, the existing directory is deleted recursively at the beginning of the operation and is not restored if the operation fails. Be careful not to export to a directory containing data you want to keep. For an export to a Linux file system or HDFS, the directory is only overwritten if the export succeeds.

Do not do concurrent exports to the same directory. In particular, if you do so with a value of `overwrite`, all operations appear to succeed, but the results are incorrect.

When using `append`, be careful to use the same table schema. Otherwise, queries of external tables using this data path could fail.

filename

If specified, all output is written to a single file of this name in the location specified by `directory`. While the query can be processed by multiple nodes, only a single node generates the output data. The `fileSizeMB` parameter is ignored, and the query cannot use partitioning in the `OVER()` clause.

compression

Column compression type, one of:

- `Snappy`
- `GZIP`
- `Brotli`
- `ZSTD`
- `Uncompressed`

Default: `Snappy`

rowGroupSizeMB

The uncompressed size of exported row groups, in MB, an integer value between 1 and `fileSizeMB`, inclusive, or unlimited if `fileSizeMB` is 0.

The row groups in the exported files are smaller than this value because Parquet files are compressed on write. For best performance when exporting to HDFS, set `size` to be smaller than the HDFS block size.

Row-group size affects memory consumption during export. An export thread consumes at least double the row-group size. The default value of 512MB is a compromise between writing larger row groups and allowing enough free memory for other Vertica operations. If you perform exports when the database is not otherwise under heavy load, you can improve read performance on the exported data by increasing row-group size on export. However, row groups that span multiple blocks on HDFS decrease read performance by requiring more I/O, so do not set the row-group size to be larger than your HDFS block size.

Default: 512

fileSizeMB

The maximum file size of a single output file. This value is a hint, not a hard limit. A value of 0 specifies no limit. If `filename` is also specified, `fileSizeMB` is ignored.

This value affects the size of individual output files, not the total output size. For smaller values, Vertica divides the output into more files; all data is still exported.

Default: 10GB

fileMode

For writes to HDFS only, permission to apply to all exported files. You can specify the value in Unix octal format (such as `665`) or `user - group - other` format—for example, `rwxr-xr-x`. The value must be formatted as a string even if using the octal format.

Valid octal values range between 0 and 1777, inclusive. See [HDFS Permissions](#) in the Apache Hadoop documentation.

When writing files to any destination other than HDFS, this parameter has no effect.

Default: `660`, regardless of the value of `fs.permissions.umask-mode` in `hdfs-site.xml`.

dirMode

For writes to HDFS only, permission to apply to all exported directories. Values follow the same rules as those for `fileMode`. Further, you must give the Vertica HDFS user full permission, at least `rwX-----` or `700`.

When writing files to any destination other than HDFS, this parameter has no effect.

Default: `755`, regardless of the value of `fs.permissions.umask-mode` in `hdfs-site.xml`.

int96AsTimestamp

Boolean, specifies whether to export timestamps as int96 physical type (true) or int64 physical type (false).

Default: true

Privileges

Non-superusers:

- Source table: SELECT
- Source table schema: USAGE
- Destination directory: Write

Query restrictions

You must provide an alias column label for selected column targets that are expressions.

If you partition the output, you cannot specify schema and table names in the SELECT statement. Specify only the column name.

The query can contain only a single outer SELECT statement. For example, you cannot use UNION:

```
=> EXPORT TO PARQUET(directory = '/mnt/shared_nfs/accounts/rm')
  OVER(PARTITION BY hash)
  AS
  SELECT 1 as account_id, '{}' as json, 0 hash
  UNION ALL
  SELECT 2 as account_id, '{}' as json, 1 hash;
ERROR 8975: Only a single outer SELECT statement is supported
HINT: Please use a subquery for multiple outer SELECT statements
```

Instead, rewrite the query to use a subquery:

```
=> EXPORT TO PARQUET(directory = '/mnt/shared_nfs/accounts/rm')
  OVER(PARTITION BY hash)
  AS
  SELECT
    account_id,
    json
  FROM
  (
    SELECT 1 as account_id, '{}' as json, 0 hash
    UNION ALL
    SELECT 2 as account_id, '{}' as json, 1 hash
  ) a;
Rows Exported
-----
      2
(1 row)
```

To use composite statements such as UNION, INTERSECT, and EXCEPT, rewrite them as subqueries.

Data types

EXPORT TO PARQUET converts Vertica data types to Hive data types as shown in the following table.

Vertica Data Type	Hive Data Type
INTEGER, BIGINT	BIGINT
FLOAT, DECIMAL, SMALLINT, TINYINT, CHAR, BOOLEAN	Corresponding Hive type
VARCHAR, LONG VARCHAR	VARCHAR (max 64KB) or STRING (can be read as either)
BINARY, VARBINARY, LONG VARBINARY	BINARY
DATE	DATE if supported by your version of Hive, otherwise INT96 (can be read as TIMESTAMP)

TIMESTAMP, TIMESTAMPTZ	TIMESTAMP. Vertica does not convert TIMESTAMP values to UTC. To avoid problems arising from time zones, use TIMESTAMPTZ instead of TIMESTAMP.
TIME, TIMEZ, INTERVAL	Not supported
ARRAY	ARRAY
SET	Not supported
ROW	STRUCT

Decimal precision must be ≤ 38 .

The exported Hive types might not be identical to the Vertica types. For example, a Vertica INT is exported as a Hive BIGINT. When defining Hive external tables to read exported data, you might have to adjust column definitions.

This operation exports raw Flex columns as binary data.

Output

The export operation always creates (or appends to) an output directory, even if all output is written to a single file or the query produces zero rows.

Output file names follow the pattern: *prefix - nodename - threadId [- sequenceNumber].parquet* . *prefix* is typically an 8-character hash, but can be longer if the export appended to an existing directory. A sequence number is added if an export needs to be broken into pieces to satisfy `fileSizeMB` .

Column names in partition directories are lowercase.

Files exported to a local file system by any Vertica user are owned by the Vertica superuser. Files exported to HDFS or object stores are owned by the Vertica user who exported the data.

Making concurrent exports to the same output destination is an error and can produce incorrect results.

Exports to the local file system can be to an NFS mount (shared) or to the Linux file system on each node (non-shared). For details, see [Exporting to the Linux file system](#) . Exports to non-shared local file systems have the following restrictions:

- The output directory must not exist on any node.
- You must have a USER storage location or superuser privileges.
- You cannot override the permissions mode of 700 for directories and 600 for files.

Exports to object-store file systems are not atomic. Be careful to wait for the export to finish before using the data. For details, see [Exporting to object stores](#) .

Examples

The following example demonstrates exporting all columns from the T1 table in the public schema, using GZIP compression.

```
=> EXPORT TO PARQUET(directory='webhdfs:///user1/data', compression='gzip')
AS SELECT * FROM public.T1;
```

The following example demonstrates exporting the results of a query using more than one table.

```
=> EXPORT TO PARQUET(directory='s3://DataLake/sales_by_region')
AS SELECT sale.price, sale.date, store.region
FROM public.sales sale
JOIN public.vendor store ON sale.distribID = store.ID;
```

The following example demonstrates partitioning and exporting data. EXPORT TO PARQUET first partitions the data on region and then, within each partition, sorts by store.

```
=> EXPORT TO PARQUET(directory='gs://DataLake/user2/data')
OVER(PARTITION BY store.region ORDER BY store.ID)
AS SELECT sale.price, sale.date, store.ID
FROM public.sales sale
JOIN public.vendor store ON sale.distribID = store.ID;
```

The following example uses an alias column label for a selected column target that is an expression.

```
=> EXPORT TO PARQUET(directory='webhdfs:///user3/data')
  OVER(ORDER BY col1) AS SELECT col1 + col1 AS A, col2
  FROM public.T3;
```

The following example sets permissions for the output.

```
=> EXPORT TO PARQUET(directory='webhdfs:///user1/data',
  fileMode='432', dirMode='rwxrw-r-x')
  AS SELECT * FROM public.T1;
```

EXPORT TO VERTICA

Exports table data from one Vertica database to another. A connection to the target database must exist in the current session before starting the copy operation. Otherwise, Vertica returns an error. For details, see [CONNECT TO VERTICA](#).

Important

The source database must be no more than one major release behind the target database.

Syntax

```
EXPORT [ /*+LABEL (label-string)* / ] TO VERTICA
 { database. | [namespace.] [schema.]target-table [ ( target-columns ) ]
 { AS SELECT query-expression | FROM [schema.]source-table[ ( source-columns ) ] }
```

Arguments

LABEL

Assigns a label to a statement to identify it for profiling and debugging.

namespace

For Eon Mode databases, [namespace](#) in the target database to which data is exported. If unspecified, the target namespace is set to `default_namespace`.

database

For Enterprise Mode databases, the target database to which data is exported. A connection to this database must already exist in the current session before starting the copy operation; otherwise Vertica returns an error. For details, see [CONNECT TO VERTICA](#).

target-table

The table in the target database to store the exported data. The table cannot have columns of [complex data types](#) other than native arrays.

target-columns

A comma-delimited list of columns in [target-table](#) in which to store the exported data. See [Mapping Between Source and Target Columns](#), below.

query-expression

The data to export.

[namespace .][schema .] source-table

The table in the source database that contains the data to export. The namespace option only applies to Eon Mode databases. If no namespace is specified, Vertica assumes the table belongs to the `default_namespace`.

source-columns

A comma-delimited list of the columns in the source table to export. The table cannot have columns of complex data types. See [Mapping Between Source and Target Columns](#), below.

Privileges

Non-superusers:

- Source table: SELECT
- Source table schema: USAGE
- Target table: INSERT
- Target table schema: USAGE

Mapping between source and target columns

If you export all table data from one database to another, EXPORT TO VERTICA can omit specifying column lists if column definitions in both tables comply with the following conditions:

- Same number of columns

- Identical column names
- Same sequence of columns
- Matching or [compatible](#) column data types
- No complex data types (ARRAY, SET, or ROW), except for native arrays

If any of these conditions is not true, the EXPORT TO VERTICA statement must include column lists that explicitly map source and target columns to each other, as follows:

- Contain the same number of columns.
- List source and target columns in the same order.
- Pair columns with the same (or [compatible](#)) data types.

Examples

See [Exporting data to another database](#).

See also

- [Handling node failure during copy/export](#)
- [COPY FROM VERTICA](#)

GET DIRECTED QUERY

Queries the [DIRECTED_QUERIES](#) system table on the specified input query, and returns details of all directed queries that map to the input query. For details about output, see [Managing directed queries](#).

Syntax

```
GET DIRECTED QUERY input-query
```

Arguments

input-query

An input query that is associated with one or more directed queries.

Privileges

None

Examples

See [Managing directed queries](#).

GRANT statements

GRANT statements grant privileges on database objects to [users](#) and [roles](#).

Important

In a database with trust authentication, GRANT statements appear to work as expected but have no real effect on database security.

In this section

- [GRANT \(authentication\)](#)
- [GRANT \(data loader\)](#)
- [GRANT \(database\)](#)
- [GRANT \(key\)](#)
- [GRANT \(library\)](#)
- [GRANT \(model\)](#)
- [GRANT \(procedure\)](#)
- [GRANT \(Resource pool\)](#)
- [GRANT \(Role\)](#)
- [GRANT \(schema\)](#)
- [GRANT \(sequence\)](#)
- [GRANT \(storage location\)](#)
- [GRANT \(table\)](#)
- [GRANT \(TLS configuration\)](#)
- [GRANT \(user defined extension\)](#)
- [GRANT \(view\)](#)
- [GRANT \(workload\)](#)

GRANT (authentication)

Associates an authentication record to one or more [users](#) and [roles](#).

Syntax

```
GRANT AUTHENTICATION auth-method-name TO grantee[,...]
```

Parameters

auth-method-name

Name of the authentication method to associate with one or more users or roles.

grantee

Specifies who is associated with the authentication method, one of the following:

- [User name](#)
- [Role](#)
- [PUBLIC](#): The default role of all users.

Privileges

Superuser

Examples

- Associate [v_ldap](#) authentication with user [jsmith](#) :

```
=> GRANT AUTHENTICATION v_ldap TO jsmith;
```

- Associate [v_gss](#) authentication to the role [DBprogrammer](#) :

```
=> CREATE ROLE DBprogrammer;  
=> GRANT AUTHENTICATION v_gss TO DBprogrammer;
```

- Associate client authentication method [v_localpwd](#) with role [PUBLIC](#) , which is assigned by default to all users:

```
=> GRANT AUTHENTICATION v_localpwd TO PUBLIC;
```

See also

- [REVOKE \(authentication\)](#)
- [Granting and revoking privileges](#)

GRANT (data loader)

Grants privileges on automatic data loaders to [users](#) and [roles](#). By default, only superusers and the owner can [execute](#) or [alter](#) a data loader.

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] }  
ON DATA LOADER [schema.]name  
TO grantee[,...]  
[ WITH GRANT OPTION ]
```

Arguments

privilege

One of the following privileges:

- EXECUTE: Enables [EXECUTE DATA LOADER](#).
- ALTER: Enables [ALTER DATA LOADER](#).
- DROP: Enables [DROP DATA LOADER](#).

ALL [PRIVILEGES]

Grants all privileges. Inherited privileges must be granted explicitly.

schema

Schema containing the data loader. The default schema is [public](#) .

name

Name of the data loader.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- [PUBLIC](#) : Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superusers, one of the following:

- Owner.
- Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles.

See also

- [REVOKE \(data loader\)](#)
- [Granting and revoking privileges](#)

GRANT (database)

Grants database privileges to [users](#) and [roles](#).

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] }
ON DATABASE db-spec
TO grantee[,...]
[ WITH GRANT OPTION ]
```

Parameters

privilege

The following privileges are valid for a database:

- **CREATE** : Create schemas.
- **TEMP** : Create temporary tables. By default, all users are granted this privilege through their **DEFAULT** role.

ALL [PRIVILEGES]

Grants all database privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.

The optional keyword **PRIVILEGES** conforms with the SQL standard.

db-spec

Specifies the current database, set to the database name or **DEFAULT**.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- [PUBLIC](#) : Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superuser: Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles.

Examples

The following example grants user Fred the right to create schemas in the current database.

```
=> GRANT CREATE ON DATABASE DEFAULT TO Fred;
```

See also

- [REVOKE \(database\)](#)
- [Granting and revoking privileges](#)

GRANT (key)

Grants privileges on a cryptographic key to a user or role.

Important

Because certificates depend on their underlying key, DROP privileges on a key effectively act as DROP privileges on its associated certificate when used with [DROP KEY...CASCADE](#).

To revoke granted privileges, see [REVOKE \(key\)](#).

Superusers have limited access to cryptographic objects that they do not own. For details, see [Database object privileges](#).

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] } ON KEY
  key_name[,...]
  TO grantee[,...]
  [ WITH GRANT OPTION ]
```

Parameters

privilege

A privilege, one of the following:

- USAGE: Allows a user to perform the following actions:
 - [View](#) the contents of the key.
 - [Create or sign](#) certificates using the key.

USAGE on the key also gives implicit USAGE privileges on a certificate that uses it as its private key. Users can also get these privileges from ownership of the key or certificate. USAGE privileges on a certificate allow a user to perform the following actions:

- [View](#) the contents of the certificate.
 - Add (with [CREATE](#) or [ALTER](#)) the certificate to a TLS Configuration.
 - Reuse the CA certificate when importing certificates signed by it. For example, if a user imports a chain of certificates $A > B > C$ and have USAGE on B , the database reuses B (as opposed to creating a duplicate of B).
 - Specify that the CA certificate signed an imported certificate. For example, if certificate B signed certificate C , USAGE on B allows a user to import C and specify that it was [SIGNED BY B](#).
- [DROP](#)
 - ALTER: Allows a user to see the [key](#) and its associated [certificates](#) in their respective system tables, but not their contents.

key_name

The target [key](#).

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- [PUBLIC](#): Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superuser:

- Owner
- Privileges grantee given the option ([WITH GRANT OPTION](#)) of granting privileges to other users or roles.

Examples

The following example grants USAGE privileges on a private key to a user, which then allows the user to add the self-signed CA certificate to the [server](#) TLS Configuration:

```

=> CREATE KEY new_ca_key TYPE 'RSA' LENGTH 2048;
=> CREATE CA CERTIFICATE new_ca_cert
  SUBJECT '/C=US/ST=Massachusetts/L=Cambridge/O=Micro Focus/OU=Vertica/CN=Vertica example CA'
  VALID FOR 3650
  EXTENSIONS 'authorityKeyIdentifier' = 'keyid:always,issuer', 'nsComment' = 'new CA'
  KEY new_ca_key;

=> CREATE USER u1;
=> GRANT USAGE ON KEY new_ca_key TO u1;
=> GRANT ALTER ON TLS CONFIGURATION data_channel TO u1;

=> \c - u1

=> ALTER TLS CONFIGURATION data_channel ADD CA CERTIFICATES new_ca_cert;

-- clean up:
=> \c
=> ALTER TLS CONFIGURATION data_channel REMOVE CA CERTIFICATES new_ca_cert;
=> DROP KEY new_ca_key CASCADE;
=> DROP USER u1;

```

GRANT (library)

Grants privileges on one or more libraries to [users](#) and [roles](#).

For example, when working with the Connector Framework Service, you might need to grant a user usage privileges to a library to be able to set UDSession parameters. For more information see [Implementing CFS](#).

Syntax

```

GRANT privilege
  ON LIBRARY [[database.]schema.]library[,...]
  TO grantee[,...]
  [ WITH GRANT OPTION ]

```

Arguments

privilege

Privilege to grant, one of:

- **USAGE** : Grants access to functions in the specified libraries.
- **DROP** : Grants permission to drop libraries that the grantee created.
- **ALL [PRIVILEGES] [EXTEND]** : Grants all library privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.

You can qualify **ALL** with two optional keywords:

- **PRIVILEGES** conforms with the SQL standard.
- **EXTEND** extends the semantics of **ALL** to include DROP privileges. An unqualified **ALL** excludes this privilege. This option enables backward compatibility with **GRANT ALL** usage in pre-9.2.1 Vertica releases.

Important

To execute functions inside the library, users must also have separate **EXECUTE** privileges on them, and **USAGE** privileges on their respective schemas.

[**database.**] **schema**

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

library

The target library.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)

- [PUBLIC](#): Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superusers require [USAGE on the schema](#) and one of the following:

- Owner
- Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles.

Examples

Grant USAGE privileges on the [MyFunctions](#) library to [Fred](#) :

```
=> GRANT USAGE ON LIBRARY MyFunctions TO Fred;
```

See also

- [REVOKE \(library\)](#)
- [Granting and revoking privileges](#)

GRANT (model)

Grants usage privileges on a model to [users](#) and [roles](#).

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] }  
ON MODEL [[database.]schema.]model-name[,...]  
TO grantee[,...]  
[ WITH GRANT OPTION ]
```

Parameters

privilege

The following privileges are valid for models:

- USAGE
- [ALTER](#)
- [DROP](#)

ALL [PRIVILEGES][EXTEND]

Grants all model privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.

You can qualify **ALL** with two optional keywords:

- **PRIVILEGES** conforms with the SQL standard.
- **EXTEND** extends the semantics of **ALL** to include ALTER and DROP privileges. An unqualified **ALL** excludes these two privileges. This option enables backward compatibility with **GRANT ALL** usage in pre-9.2.1 Vertica releases.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

model-name

The model on which to grant the privilege.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- [PUBLIC](#): Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superusers require [USAGE on the schema](#) and one of the following:

- Owner
- Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles.

Examples

This example grants USAGE privileges on the mySvmClassModel model to user1:

```
=> GRANT USAGE ON MODEL mySvmClassModel TO user1;
```

See also

- [REVOKE \(model\)](#)
- [Managing model security](#)

GRANT (procedure)

Grants privileges on a [stored procedure](#) or [external procedure](#) to a [user](#) or [role](#).

Important

External procedures that you create with [CREATE PROCEDURE \(external\)](#) are always run with Linux dbadmin privileges. If a dbadmin or pseudosuperuser grants a non-dbadmin permission to run a procedure using [GRANT \(procedure\)](#), be aware that the non-dbadmin user runs the procedure with full Linux dbadmin privileges.

Syntax

```
GRANT { EXECUTE | ALL [ PRIVILEGES ] }  
  ON PROCEDURE [[database.]schema.]procedure( [arg-list] ),...]  
  TO grantee[,...]  
  [ WITH GRANT OPTION ]
```

Parameters

EXECUTE

Enables grantees to run the specified *procedure*.

ALL [PRIVILEGES]

Grants all procedure privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.

The optional keyword **PRIVILEGES** conforms with the SQL standard.

[*database* .] *schema*

Database and [schema](#). The default schema is **public**. If you specify a database, it must be the current database.

procedure

The target procedure.

arg-list

A comma-delimited list of procedure arguments, where each argument is specified as follows:

```
[ argname ] argtype
```

If the procedure is defined with no arguments, supply an empty argument list.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- **PUBLIC**: Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superuser, one of the following:

- Owner

- Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles

Examples

Grant EXECUTE privileges on the **tokenize** procedure to users **Bob** and **Jules** , and to the role **Operator** :

```
=> GRANT EXECUTE ON PROCEDURE tokenize(varchar) TO Bob, Jules, Operator;
```

See also

- [REVOKE \(procedure\)](#)
- [Granting and revoking privileges](#)

GRANT (Resource pool)

Grants USAGE privileges on resource pools to [users](#) and [roles](#) . Users can access their resource pools with [ALTER USER](#) or [SET SESSION RESOURCE POOL](#) .

Syntax

```
GRANT USAGE
ON RESOURCE POOL resource-pool[,...]
[FOR SUBCLUSTER subcluster | FOR CURRENT SUBCLUSTER]
TO grantee[,...]
[ WITH GRANT OPTION ]
```

Parameters

USAGE

Enables grantees to access the specified resource pools.

ALL [PRIVILEGES]

Grants all resource pool privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.

The optional keyword **PRIVILEGES** conforms with the SQL standard.

resource-pool

A resource pool on which to grant the specified privileges.

subcluster

The subcluster for the resource pool.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- **PUBLIC** : Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#) .

Privileges

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

Examples

Grant user **Joe** USAGE privileges on resource pool **Joe_pool** .

```
=> CREATE USER Joe;
CREATE USER
=> CREATE RESOURCE POOL Joe_pool;
CREATE RESOURCE POOL
=> GRANT USAGE ON RESOURCE POOL Joe_pool TO Joe;
GRANT PRIVILEGE
```

Grant user **Joe** USAGE privileges on resource pool **Joe_pool** for subcluster **sub1** .

```
=> GRANT USAGE on RESOURCE POOL Joe_pool FOR SUBCLUSTER sub1 TO Joe;  
GRANT PRIVILEGE
```

See also

- [REVOKE \(Resource pool\)](#)
- [Granting and revoking privileges](#)

GRANT (Role)

Assigns roles to [users](#) or other [roles](#).

Note

Granting a role does not activate the role automatically; you must [enable it](#) with the [SET ROLE](#) statement or specify it as a default role to enable it automatically.

Syntax

```
GRANT role[,...] TO grantee[,...] [ WITH ADMIN OPTION ]
```

Arguments

role

A role to grant

grantee

User or role to be granted the specified roles, one of the following:

- [User name](#)
- [Role](#)
- [PUBLIC](#): The default role of all users.

WITH ADMIN OPTION

Gives *grantee* the privilege to grant the specified roles to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superuser: If WITH GRANT OPTION is used, can grant the same roles to other users or roles.

Examples

See [Granting database roles](#).

See also

[REVOKE \(Role\)](#)

GRANT (schema)

Grants schema privileges to [users](#) and [roles](#). By default, only superusers and the schema owner have the following schema privileges:

- Create objects within a schema.
- [Alter](#) and [drop](#) a schema.

Note

By default, new users cannot access schema PUBLIC. You must explicitly grant all new users USAGE privileges on the PUBLIC schema.

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] }  
ON SCHEMA [{namespace. | database. }] schema[,...]  
TO grantee[,...]  
[ WITH GRANT OPTION ]
```

Parameters

privilege

One of the following privileges:

- USAGE: Enables access to objects in the specified schemas. Grantees can then be granted privileges on individual objects in these schemas in order to access them, for example, with [GRANT TABLE](#) and [GRANT VIEW](#).

- CREATE: Create and rename objects in the specified schemas, and move objects from other schemas.

You can also grant the following privileges on a schema, to be inherited by tables and their projections, and by views of that schema. If inheritance is enabled [for the database](#) and [schema](#), these privileges are automatically granted to those objects on creation:

- SELECT: [Query](#) tables and views. SELECT privileges are granted by default to the PUBLIC role.
- INSERT: [Insert](#) rows, or and load data into tables with [COPY](#).

Note

[COPY FROM STDIN](#) is allowed for users with INSERT privileges, while [COPY FROM file](#) requires admin privileges.

- UPDATE: [Update](#) table rows.
- DELETE: [Delete](#) table rows.
- REFERENCES: Create [foreign key constraints](#) on this table. This privilege must be set on both referencing and referenced tables.
- TRUNCATE: [Truncate](#) table contents. Non-owners of tables can also execute the following partition operations on them:
 - [DROP PARTITIONS](#)
 - [SWAP PARTITIONS BETWEEN TABLES](#)
 - [MOVE PARTITIONS TO TABLE](#)
- ALTER: Modify the DDL of tables and views with [ALTER TABLE](#) and [ALTER VIEW](#), respectively.
- DROP: Drop tables and views.

ALL [PRIVILEGES][EXTEND]

Grants USAGE AND CREATE privileges. Inherited privileges must be granted explicitly.

You can qualify **ALL** with two optional keywords:

- **PRIVILEGES** conforms with the SQL standard.
- **EXTEND** extends the semantics of **ALL** to include ALTER and DROP privileges. An unqualified **ALL** excludes these two privileges. This option enables backward compatibility with **GRANT ALL** usage in pre-9.2.1 Vertica releases.

{ *namespace* . | *database* . }

Name of the database or [namespace](#) that contains *schema*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *schema* belongs. If unspecified, the namespace is assumed to be [default_namespace](#).
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#).

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- [PUBLIC](#): Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superusers, one of the following:

- Schema owner
- Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles.

Examples

Grant user Joe USAGE privilege on schema [online_sales](#).

```
=> CREATE USER Joe;
CREATE USER
=> GRANT USAGE ON SCHEMA online_sales TO Joe;
GRANT PRIVILEGE
```

See also

- [REVOKE \(schema\)](#)
- [Granting and revoking privileges](#)

GRANT (sequence)

Grants [sequence](#) privileges to [users](#) and [roles](#).

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] }  
ON {  
  SEQUENCE [[database.]schema.]sequence[,...]  
  | ALL SEQUENCES IN SCHEMA [database.]schema[,...] }  
TO grantee[,...]  
[ WITH GRANT OPTION ]
```

Parameters

privilege

The following privileges are valid for sequences:

- SELECT: Execute functions [CURRVAL](#) and [NEXTVAL](#) on the specified sequences.
- ALTER: Modify a sequence's DDL with [ALTER SEQUENCE](#)
- DROP: Drop this sequence with [DROP SEQUENCE](#).

ALL [PRIVILEGES][EXTEND]

Grants all [sequence privileges](#) that also belong to the grantor. Grantors cannot grant privileges that they themselves lack

You can qualify **ALL** with two optional keywords:

- **PRIVILEGES** conforms with the SQL standard.
- **EXTEND** extends the semantics of **ALL** to include ALTER and DROP privileges. An unqualified **ALL** excludes these two privileges. This option enables backward compatibility with **GRANT ALL** usage in pre-9.2.1 Vertica releases.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

SEQUENCE *sequence*

Specifies the sequence on which to grant privileges.

ALL SEQUENCES IN SCHEMA *schema*

Grants the specified privileges on all sequences in schema *schema*.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- **PUBLIC**: Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superusers require [USAGE on the schema](#) and one of the following:

- Owner
- Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles.

Examples

This example shows how to grant user [Joe](#) all privileges on sequence [my_seq](#).

```
=> CREATE SEQUENCE my_seq START 100;  
CREATE SEQUENCE  
=> GRANT ALL PRIVILEGES ON SEQUENCE my_seq TO Joe;  
GRANT PRIVILEGE
```

See also

- [REVOKE \(sequence\)](#)
- [Granting and revoking privileges](#)
- [Creating and using named sequences](#)

GRANT (storage location)

Grants privileges to [users](#) and [roles](#) on a USER-defined storage location. For details, see [Creating storage locations](#).

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] }  
  ON LOCATION 'path' [ ON node ]  
  TO grantee[,...]  
  [ WITH GRANT OPTION ]
```

Parameters

privilege

The following privileges are valid for storage locations:

- **READ** : Copy data from files in the storage location into a table.
- **WRITE** : Export data from the database to the storage location. With **WRITE** privileges, grantees can also save **COPY** statement rejected data and exceptions files to the storage location.

ALL [PRIVILEGES]

Grants all storage location privileges that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.

The optional keyword **PRIVILEGES** conforms with the SQL standard.

ON LOCATION ' *path* ' [ON *node*]

Specifies the path name mount point of the storage location. If qualified by **ON NODE** , Vertica grants access to the storage location residing on *node* .

If no node is specified, the grant operation applies to all nodes on the specified path. All nodes must be on the specified path; otherwise, the entire grant operation rolls back.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- **PUBLIC** : Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

Note

Only a superuser can add, alter, retire, drop, and restore a location.

Examples

Create a storage location:

```
=> CREATE LOCATION '/home/dbadmin/UserStorage/BobStore' NODE 'v_mcdb_node0007' USAGE 'USER';  
CREATE LOCATION
```

Grant user **Bob** all available privileges to the **/BobStore** location:

```
=> GRANT ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' TO Bob;
GRANT PRIVILEGE
```

Revoke all storage location privileges from Bob:

```
=> REVOKE ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' FROM Bob;
REVOKE PRIVILEGE
```

Grant privileges to **Bob** on the **BobStore** location again, specifying a node:

```
=> GRANT ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' ON v_mcdb_node0007 TO Bob;
GRANT PRIVILEGE
```

Revoke all storage location privileges from **Bob** :

```
=> REVOKE ALL ON LOCATION '/home/dbadmin/UserStorage/BobStore' ON v_mcdb_node0007 FROM Bob;
REVOKE PRIVILEGE
```

See also

- [Storage functions](#)
- [REVOKE \(storage location\)](#)
- [Granting and revoking privileges](#)

GRANT (table)

Grants table privileges to [users](#) and [roles](#). Users must also be [granted USAGE on the table schema](#).

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] }
ON {
  [ TABLE ] [ [ { namespace. | database. } ] schema. ] table[,...]
  | ALL TABLES IN SCHEMA [ { namespace. | database. } ] schema[,...] }
TO grantee[,...]
[ WITH GRANT OPTION ]
```

Parameters

privilege

The following privileges are valid for tables:

Important

Only SELECT privileges are valid for system tables.

- SELECT: [Query](#) tables. SELECT privileges are granted by default to the PUBLIC role.
- INSERT: Insert table rows with [INSERT](#), and load data with [COPY](#).

Note

[COPY FROM STDIN](#) is allowed for users with INSERT privileges, while [COPY FROM file](#) requires admin privileges.

- UPDATE: [Update](#) table rows.
- DELETE: [Delete](#) table rows.
- REFERENCES: Create [foreign key constraints](#) on this table. This privilege must be set on both referencing and referenced tables.
- TRUNCATE: [Truncate](#) table contents. Non-owners of tables can also execute the following partition operations on them:
 - [DROP PARTITIONS](#)
 - [SWAP PARTITIONS BETWEEN TABLES](#)
 - [MOVE PARTITIONS TO TABLE](#)
- ALTER: Modify a table's DDL with [ALTER TABLE](#).
- DROP: [Drop a table](#).

ALL [PRIVILEGES][EXTEND]

Invalid for system tables, grants all [table privileges](#) that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.

You can qualify **ALL** with two optional keywords:

- **PRIVILEGES** conforms with the SQL standard.
- **EXTEND** extends the semantics of **ALL** to include ALTER and DROP privileges. An unqualified **ALL** excludes these two privileges. This option enables backward compatibility with **GRANT ALL** usage in pre-9.2.1 Vertica releases.

{ *namespace.* | *database.* }

Name of the database or [namespace](#) that contains *table* , depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be **default_namespace** .
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default **public** . If you specify the namespace or database name, you must provide the schema name, even if the schema is **public** .

TABLE *table*

Specifies the table on which to grant privileges.

Note

The table can be a global temporary table, but not a local temporary table. See [Creating temporary tables](#) .

ON ALL TABLES IN SCHEMA *schema*

Grants the specified privileges on all tables and views in schema *schema* .

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- **PUBLIC** : Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#) .

Privileges

Non-superusers require [USAGE on the schema](#) and one of the following:

- Owner
- Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles.

Examples

Grant user **Joe** all privileges on table **customer_dimension** :

```
=> CREATE USER Joe;
CREATE USER
=> GRANT ALL PRIVILEGES ON TABLE customer_dimension TO Joe;
GRANT PRIVILEGE
```

Grant user **Joe** SELECT privileges on all system tables:

```
=> GRANT SELECT on all tables in schema V_MONITOR, V_CATALOG TO Joe;
GRANT PRIVILEGE
```

See also

- [REVOKE \(table\)](#)
- [Granting and revoking privileges](#)

GRANT (TLS configuration)

Grants privileges on a TLS Configuration to a user or role.

To revoke granted privileges, see [REVOKE \(TLS configuration\)](#) .

Superusers have limited access to cryptographic objects that they do not own. For details, see [Database object privileges](#) .

Syntax

```
GRANT { privilege[,...] } ON TLS CONFIGURATION
  tls_configuration[,...]
  TO grantee[,...]
  [ WITH GRANT OPTION ]
```

Parameters

privilege

A privilege, one of the following:

- **USAGE**: Allows the user to set the TLS Configuration for a type of connection and view its contents in the system table [TLS_CONFIGURATIONS](#). For details, see [Security parameters](#).
- [DROP](#)
- [ALTER](#)

tls_configuration

The target TLS Configuration.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- [PUBLIC](#): Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superuser:

- Owner
- Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles.

Examples

You can grant ALTER on a TLS Configuration to a user or role to delegate management of that TLS context, which includes adding and removing certificates, setting the TLSMODE, etc. For example, the following statement grants [ALTER](#) privileges on the TLS CONFIGURATION **server** to the role **client_server_tls_manager** :

```
=> GRANT ALTER ON TLS CONFIGURATION server TO client_server_tls_manager;
```

GRANT (user defined extension)

Grants privileges on a [user-defined extensions](#) (UDx) to [users](#) and [roles](#).

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] }
  ON {
    UDx-type [[database.]schema.]function( [arg-lis] )[,...]
    | ALL FUNCTIONS IN SCHEMA schema[,...] }
  TO grantee[,...]
  [ WITH GRANT OPTION ]
```

Arguments

privilege

The following privileges are valid for user-defined extensions:

- EXECUTE
- [ALTER](#)
- [DROP](#)

Note

Users can only call a UDx function on which they have EXECUTE privilege, and USAGE privilege on its schema.

ALL [PRIVILEGES] [EXTEND]

Grants all [function privileges](#) that also belong to the grantor. Grantors cannot grant privileges that they themselves lack

You can qualify **ALL** with two optional keywords:

- **PRIVILEGES** conforms with the SQL standard.
- **EXTEND** extends the semantics of **ALL** to include ALTER and DROP privileges. An unqualified **ALL** excludes these two privileges. This option enables backward compatibility with **GRANT ALL** usage in pre-9.2.1 Vertica releases.

ON *UDx-type*

Type of the user-defined extension (UDx), one of the following:

- **FUNCTION** (scalar function)
- **AGGREGATE FUNCTION**
- **ANALYTIC FUNCTION**
- **TRANSFORM FUNCTION**
- **FILTER**
- **PARSER**
- **SOURCE**

[*database* .] *schema*

Database and [schema](#). The default schema is **public**. If you specify a database, it must be the current database.

function

Name of the user-defined function on which to grant privileges.

ON ALL FUNCTIONS IN SCHEMA *schema*

Grants privileges on all functions in the specified schema.

arg-list

Required for all polymorphic functions, a comma-delimited list of function arguments, where each argument is specified as follows:

```
[ argname ] argtype
```

If the procedure is defined with no arguments, supply an empty argument list.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- **PUBLIC**: Default role of all users

Note

Grantees must have **USAGE** privileges on the schema.

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superusers require [USAGE on the schema](#) and one of the following:

- Owner
- Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles.

Examples

Grant **EXECUTE** privileges on the **myzeroifnull** SQL function to users **Bob** and **Jules**, and to the role **Operator**. The function takes one integer argument:

```
=> GRANT EXECUTE ON FUNCTION myzeroifnull (x INT) TO Bob, Jules, Operator;
```

Grant **EXECUTE** privileges on all functions in the **zero-schema** schema to user **Bob**:

```
=> GRANT EXECUTE ON ALL FUNCTIONS IN SCHEMA zero-schema TO Bob;
```

Grant **EXECUTE** privileges on the **tokenize** transform function to user **Bob** and the role **Operator** :

```
=> GRANT EXECUTE ON TRANSFORM FUNCTION tokenize(VARCHAR) TO Bob, Operator;
```

Grant **EXECUTE** privileges on the **ExampleSource()** source to user **Alice** :

```
=> CREATE USER Alice;
=> GRANT USAGE ON SCHEMA hdfs TO Alice;
=> GRANT EXECUTE ON SOURCE ExampleSource() TO Alice;
```

Grant all privileges on the **ExampleSource()** source to user **Alice** :

```
=> GRANT ALL ON SOURCE ExampleSource() TO Alice;
```

Grant all privileges on polymorphic function **Pagerank** to the dbadmin role:

```
=> GRANT ALL ON TRANSFORM FUNCTION Pagerank(z varchar) to dbadmin;
```

See also

- [REVOKE \(user defined extension\)](#)
- [Granting and revoking privileges](#)
- [Developing user-defined extensions \(UDxs\)](#)

GRANT (view)

Grants view privileges to [users](#) and [roles](#).

Syntax

```
GRANT { privilege[,...] | ALL [ PRIVILEGES ] [ EXTEND ] }
  ON [[database.]schema.]view[,...]
  TO grantee[,...]
  [ WITH GRANT OPTION ]
```

Parameters

privilege ``

The following privileges are valid for views:

- [SELECT](#)
- [ALTER](#)
- [DROP](#)

ALL [PRIVILEGES][EXTEND]

Grants all [view privileges](#) that also belong to the grantor. Grantors cannot grant privileges that they themselves lack.

You can qualify **ALL** with two optional keywords:

- **PRIVILEGES** conforms with the SQL standard.
- **EXTEND** extends the semantics of **ALL** to include ALTER and DROP privileges. An unqualified **ALL** excludes these two privileges. This option enables backward compatibility with **GRANT ALL** usage in pre-9.2.1 Vertica releases.

[*database* .] *schema*

Database and [schema](#). The default schema is **public**. If you specify a database, it must be the current database.

view

The target view.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- **PUBLIC**: Default role of all users

WITH GRANT OPTION

Allows the grantee to grant and revoke the same privileges to other users or roles. For details, see [Granting privileges](#).

Privileges

Non-superusers require [USAGE on the schema](#) and one of the following:

- Owner
- Privileges grantee given the option (**WITH GRANT OPTION**) of granting privileges to other users or roles.

Note

As view owner, you can grant other users SELECT privilege on the view only if one of the following is true:

- You own the view's base table.
- You have SELECT...WITH GRANT OPTION privilege on the view's base table.

Examples

Grant user **Joe** all privileges on view **ship** .

```
=> CREATE VIEW ship AS SELECT * FROM public.shipping_dimension;
CREATE VIEW
=> GRANT ALL PRIVILEGES ON ship TO Joe;
GRANT PRIVILEGE
```

See also

[REVOKE \(view\)](#)

GRANT (workload)

Grants privileges to a [user](#) or [role](#) to use a [workload](#), routing its queries to its associated [subclusters](#).

Syntax

```
GRANT USAGE ON WORKLOAD workload TO {role | user}
```

Parameters

workload

A workload defined by a [routing rule](#). For details, see [Workload routing](#).

user* | *role

The [user](#) or [role](#) permitted to use the workload.

Privileges

Superuser

Examples

The following example grants the USAGE privilege on the **analytics** workload to users with the **analytics_role** role:

```
=> GRANT USAGE ON WORKLOAD analytics TO analytics_role;
```

Similarly, this example grants the USAGE privilege on the **analytics** workload to the user **jacob** :

```
=> GRANT USAGE ON WORKLOAD analytics TO jacob;
```

For more examples, see [Workload routing](#).

INSERT

Inserts values into all projections of the specified table. You must insert one complete tuple at a time. If no projections are associated with the target table, Vertica creates a superprojection to store the inserted values.

INSERT works for flex tables as well as regular native tables. If the table has real columns, inserted data of scalar types and native arrays of scalar types is added to both the real column and the **__raw__** column. For data of [complex types](#), the values are not added to the **__raw__** column.

Syntax

```
INSERT [ /*+LABEL (label-string)* / ] INTO [[[namespace. | database. ]]schema.]table-name
[ ( column-list ) ]
{ DEFAULT VALUES | VALUES ( values-list )[,...] | SELECT query-expression }
```

Arguments

LABEL

Assigns a label to a statement to identify it for profiling and debugging.

{ namespace. | database. }

Name of the database or [namespace](#) that contains *table* , depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be [default_namespace](#) .
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#) . If you specify the namespace or database name, you must provide the schema name, even if the schema is [public](#) .

table-name

The target table. You cannot invoke INSERT on a projection.

column-list

A comma-delimited list of one or more target columns in this table, listed in any order. VALUES clause values are mapped to columns in the same order. If you omit this list, Vertica maps VALUES clause values to columns according to column order in the table definition.

A list of target columns is invalid with DEFAULT VALUES .

DEFAULT VALUES

Fills all columns with their default values as specified in the table definition. If no default value is specified for a column, Vertica inserts a NULL value.

You cannot specify a list of target columns with this option.

VALUES (values-list)

A comma-delimited list of one or more values to insert in the target columns, where each value is one of the following:

- *expression* resolves to a value to insert in the target column. The expression must not nest other expressions, include Vertica meta-functions, or use mixed complex types. Values may include native array or ROW types if Vertica can coerce the element or field types.
- DEFAULT inserts the default value as specified in the table definition.

If no value is supplied for a column, Vertica implicitly adds a DEFAULT value, if defined. Otherwise Vertica inserts a NULL value. If the column is defined as NOT NULL , INSERT returns an error.

You can use INSERT to insert multiple rows in the target table, by specifying multiple comma-delimited VALUES lists:

```
INSERT INTO table-name
VALUES ( values-list ), ( values-list )[,...]
```

For details, see [Multi-Row INSERT](#) below.

SELECT query-expression

A query that returns the rows to insert. Isolation level applies only to the SELECT clauses and works like any query. Restrictions on use of [complex types](#) apply as in other queries.

Privileges

- Table owner or user with GRANT OPTION is grantor
- INSERT privilege on table
- USAGE privilege on schema that contains the table

Committing successive table changes

Vertica follows the SQL-92 transaction model, so successive INSERT, UPDATE, and DELETE statements are included in the same transaction. You do not need to explicitly start this transaction; however, you must explicitly end it with [COMMIT](#) , or implicitly end it with [COPY](#) . Otherwise, Vertica discards all changes that were made within the transaction.

Multi-row INSERT

You can use INSERT to insert multiple rows in the target table, by specifying multiple comma-delimited VALUES lists. For example:

```

=> CREATE TABLE public.t1(a int, b int, c varchar(16));
CREATE TABLE
=> INSERT INTO t1 VALUES (1,2, 'un, deux'), (3,4, 'trois, quatre');
OUTPUT
-----
      2
(1 row)

=> COMMIT;
COMMIT
=> SELECT * FROM t1;
 a | b |   c
-----+-----
 1 | 2 | un, deux
 3 | 4 | trois, quatre
(4 rows)

```

Restrictions

- Vertica does not support subqueries as the target of an INSERT statement.
- Restrictions on the use of [complex types](#) in SELECT statements apply equally to INSERT . Using complex values that cannot be coerced to the column type results in an error.
- If primary key, unique key, or check constraints are enabled for automatic enforcement in the target table, Vertica enforces those constraints when you load new data. If a violation occurs, Vertica rolls back the operation and returns an error.
- If an insert would violate a table or schema disk quota, the operation fails. For more information, see [Disk quotas](#).

Examples

```

=> INSERT INTO t1 VALUES (101, 102, 103, 104);
=> INSERT INTO customer VALUES (10, 'male', 'DPR', 'MA', 35);
=> INSERT INTO start_time VALUES (12, 'film','05:10:00:01');
=> INSERT INTO retail.t1 (C0, C1) VALUES (1, 1001);
=> INSERT INTO films SELECT * FROM tmp_films WHERE date_prod < '2004-05-07';

```

Vertica does not support subqueries or nested expressions as the target of an INSERT statement. For example, the following query returns an error message:

```

=> INSERT INTO t1 (col1, col2) VALUES ('abc', (SELECT mycolumn FROM mytable));
ERROR 4821: Subqueries not allowed in target of insert

```

You can rewrite the above query as follows:

```

=> INSERT INTO t1 (col1, col2) (SELECT 'abc', mycolumn FROM mytable);
OUTPUT
-----
      0
(1 row)

```

The following example shows how to use INSERT...VALUES with flex tables:

```
=> CREATE FLEX TABLE flex1();
CREATE TABLE
=> INSERT INTO flex1(a,b) VALUES (1, 'x');
OUTPUT
```

```
-----
1
(1 row)
```

```
=> SELECT MapToString(__raw__) FROM flex1;
      MapToString
```

```
-----
{
"a": "1",
"b": "x"
}
(1 row)
```

The following example shows how to use INSERT...SELECT with flex tables:

```
=> CREATE FLEX TABLE flex2();
CREATE TABLE
=> INSERT INTO flex2(a, b) SELECT a, b, '2016-08-10 11:10' c, 'Hello' d, 3.1415 e, f from flex1;
OUTPUT
```

```
-----
1
(1 row)
```

```
=> SELECT MapToString(__raw__) FROM flex2;
      MapToString
```

```
-----
{
"a": "1",
"b": "x",
"c": "2016-08-10",
"d": "Hello",
"e": 3.1415,
"f": null
}
(1 row)
```

The following examples use complex types:

```

=> CREATE TABLE inventory(storeID INT, product ROW(name VARCHAR, code VARCHAR));
CREATE TABLE

--- LookUpProducts() returns a row(varchar, int), which is cast to row(varchar, varchar):
=> INSERT INTO inventory(product) SELECT LookUpProducts();
OUTPUT
-----
 5
(1 row)

--- Cannot use with select...values:
=> INSERT INTO inventory(product) VALUES(LookUpProducts());
ERROR 2631: Column "product" is of type "row(varchar,varchar)" but expression is of type "row(varchar,int)"

--- Literal values are supported:
=> INSERT INTO inventory(product) VALUES(ROW('xbox',165));
OUTPUT
-----
 1
(1 row)

=> SELECT product FROM inventory;
      product
-----
{"name":"xbox","code":"125"}
(1 row)

```

LOCK TABLE

[Locks](#) a table, giving the caller's session [exclusive access](#) to certain operations. Tables are automatically unlocked after the current transaction ends—that is, after [COMMIT](#) or [ROLLBACK](#). LOCK TABLE can be useful for [preventing deadlocks](#).

To view existing locks, see [LOCKS](#).

Note

[READ COMMITTED isolation](#) (default) and [SERIALIZABLE isolation](#) automatically handle locks for you, and the vast majority of users can rely on them exclusively; LOCK TABLE is only for advanced users who need granular control over locks for more complex workloads.

To implement pessimistic concurrency without manually locking tables, you can use [SELECT...FOR UPDATE](#) to acquire an EXCLUSIVE (X) lock on the table.

Syntax

```

LOCK [ TABLE ] [{ namespace . | database . }] schema .] table [...]
  IN { lock_type } MODE
  [ NOWAIT ]

```

Parameters

{ *namespace* . | *database* . }

Name of the database or [namespace](#) that contains *table*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be [default_namespace](#).
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#). If you specify the namespace or database name, you must provide the schema name, even if the schema is [public](#).

table

The table to lock.

lock-type

The [type of lock](#), one of the following:

- SHARE
- INSERT
- INSERT VALIDATE
- SHARE INSERT
- EXCLUSIVE
- NOT DELETE
- USAGE
- OWNER

Note

LOCK TABLE does not currently support D (drop partition) locks.

NOWAIT

If specified, LOCK TABLE returns and reports an error immediately if it cannot acquire the lock. Otherwise, LOCK TABLE waits for incompatible locks to be released by their respective sessions, returning an error if the lock is not released after a certain amount of time, as defined by [LockTimeout](#).

Privileges

Required [privileges](#) depend on the type of lock requested:

Lock	Privileges
SHARED (S)	SELECT
INSERT (I)	INSERT
SHARE INSERT	SELECT, INSERT
INSERT VALIDATE (IV)	SELECT, INSERT
EXCLUSIVE (X)	UPDATE, DELETE
NOT DELETE (T)	SELECT
USAGE	All privileges
Owner	All privileges

Examples

See [Lock examples](#).

MERGE

Performs update and insert operations on a target table based on the results of a join with another data set, such as a table or view. The join can match a source row with only one target row; otherwise, Vertica returns an error.

If a merge would violate a table or schema disk quota, the operation fails. For more information, see [Disk quotas](#).

The target table cannot have columns of complex data types. The source table can, so long as those columns are not included in the merge operation.

Syntax

```
MERGE [ /*+LABEL (label-string)* / ]  
  INTO [ [ { namespace | database . } ] schema . ] target-table [ [ AS ] alias ]  
  USING source-dataset  
  ON join-condition matching-clause [ matching-clause ]
```

Returns

Number of target table rows updated or inserted

[LABEL](#)

Assigns a label to a statement to identify it for profiling and debugging.

{ *namespace.* | *database.* }

Name of the database or [namespace](#) that contains *table*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be [default_namespace](#).
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#). If you specify the namespace or database name, you must provide the schema name, even if the schema is [public](#).

target-table

The table on which to perform update and insert operations. MERGE takes an X (exclusive) lock on the target table during the operation. The table must not contain columns of complex types.

Important

The total number of target table columns cannot exceed 831.

source-dataset

The data to join to *target-table*, one of the following:

- `[[database.] schema.] table [[AS] alias]`
- `[[database.] schema.] view [[AS] alias]`
- `(subquery) sq-alias`

The specified data set typically supplies the data used to update the target table and populate new rows. You can specify an external table.

ON *join-condition*

The conditions on which to join the target table and source data set.

Tip

The Vertica query optimizer can create an optimized query plan for a MERGE statement only if the target table join column has a unique or primary key constraint. For details, see [MERGE optimization](#).

matching-clause

One of the following clauses:

- [WHEN MATCHED THEN UPDATE](#)
- [WHEN NOT MATCHED THEN INSERT](#)

MERGE supports one instance of each clause, and must include at least one.

WHEN MATCHED THEN UPDATE

For each *target-table* row that is joined (matched) to *source-dataset*, specifies to update one or more columns:

```
WHEN MATCHED [ AND update-filter ] THEN UPDATE
SET { column = expression }[,...]
```

update-filter optionally filters the set of matching rows. The update filter can specify any number of conditions. Vertica evaluates each matching row against this filter, and updates only the rows that evaluate to true. For details, see [Update and insert filters](#).

Note

Vertica also supports Oracle syntax for specifying update filters:

```
WHEN MATCHED THEN UPDATE
SET { column = expression }[,...]  
[ WHERE update-filter ]
```

The following requirements apply:

- A MERGE statement can contain only one WHEN MATCHED clause.
- *target-column* can only specify a column name in the target table. It cannot be qualified with a table name.

For details, see [Merging table data](#).

WHEN NOT MATCHED THEN INSERT

For each *source-dataset* row that is not joined (not matched) to *target-table*, specifies to:

- Insert a new row into *target-table*.
- Populate each new row with the values specified in *values-list*.

```
WHEN NOT MATCHED [ AND insert-filter ] THEN INSERT  
[ ( column-list ) ] VALUES ( values-list )
```

column-list is a comma-delimited list of one or more target columns in the target table, listed in any order. MERGE maps *column-list* columns to *values-list* values in the same order, and each column-value pair must be [compatible](#). If you omit *column-list*, Vertica maps *values-list* values to columns according to column order in the table definition.

insert-filter optionally filters the set of non-matching rows. The insert filter can specify any number of conditions. Vertica evaluates each non-matching source row against this filter. For each row that evaluates to true, Vertica inserts a new row in the target table. For details, see [Update and insert filters](#).

Note

Vertica also supports Oracle syntax for specifying insert filters:

```
WHEN NOT MATCHED THEN INSERT  
[ ( column-list ) ] VALUES ( values-list )  
[ WHERE insert-filter ]
```

The following requirements apply:

- A MERGE statement can contain only one WHEN NOT MATCHED clause.
- ** column-list ** can only specify column names in the target table. It cannot be qualified with a table name.
- Insert filter conditions can only reference the source data. If any condition references the target table, Vertica returns an error.

For details, see [Merging table data](#).

Privileges

MERGE requires the following privileges:

- SELECT permissions on the source data and INSERT, UPDATE, and DELETE permissions on the target table.
- Automatic constraint enforcement requires SELECT permissions on the table containing the constraint.
- SELECT permissions on the target table if the condition in the syntax reads data from the target table.

For example, the following GRANT statement grants *user1* access to the *t2* table. This allows *user1* to run the MERGE statement that follows:

```
=> GRANT SELECT, INSERT, UPDATE, DELETE ON TABLE t2 to user1;  
GRANT PRIVILEGE  
  
=>\c - user1  
You are now connected as user "user1".  
  
=> MERGE INTO t2 USING t1 ON t1.a = t2.a  
WHEN MATCHED THEN UPDATE SET b = t1.b  
WHEN NOT MATCHED THEN INSERT (a, b) VALUES (t1.a, t1.b);
```

Improving MERGE performance

You can improve MERGE performance in several ways:

- [Design projections for optimal MERGE performance](#).

- [Facilitate creation of optimized query plans.](#)
- Use a source data set that is smaller than the target table.

For details, see [MERGE optimization](#).

Constraint enforcement

If primary key, unique key, or check constraints are enabled for automatic enforcement in the target table, Vertica enforces those constraints when you load new data. If a violation occurs, Vertica rolls back the operation and returns an error.

Caution

If you run MERGE multiple times using the same target and source table, each iteration is liable to introduce duplicate values into the target columns and return with an error.

Columns prohibited from merge

The following columns cannot be specified in a merge operation; attempts to do so return with an error:

- [IDENTITY](#) columns, or columns whose default value is set to a [named sequence](#).
- Vmap columns such as `__raw__` in flex tables.
- Columns of complex types ARRAY, SET, or ROW.

Examples

See:

- [Basic MERGE example](#)
- [MERGE source options](#)
- [MERGE matching clauses](#)
- [Update and insert filters](#)

See also

- [Merging table data](#)

PROFILE

Profiles a single SQL statement.

Syntax

```
PROFILE { sql-statement }
```

Parameters

sql-statement

A query ([SELECT](#)) statement or DML statement--for example, you can profile [INSERT](#), [UPDATE](#), [COPY](#), and [MERGE](#).

Output

Writes profile summary to stderr, saves details to system catalog [V_MONITOR.EXECUTION_ENGINE_PROFILES](#).

Privileges

The same privileges required to run the profiled statement

Description

PROFILE generates detailed information about how the target statement executes, and saves that information in the system catalog [V_MONITOR.EXECUTION_ENGINE_PROFILES](#). Query output is preceded by a profile summary: profile identifiers `transaction_id` and `statement_id`, initiator memory for the query, and total memory required. For example:

```

=> PROFILE SELECT customer_name, annual_income FROM public.customer_dimension WHERE (customer_gender, annual_income) IN (SELECT
customer_gender, MAX(annual_income) FROM public.customer_dimension GROUP BY customer_gender);
NOTICE 4788: Statement is being profiled
HINT: Select * from v_monitor.execution_engine_profiles where transaction_id=45035996274683334 and statement_id=7;
NOTICE 3557: Initiator memory for query: [on pool general: 708421 KB, minimum: 554324 KB]
NOTICE 5077: Total memory required by query: [708421 KB]
 customer_name | annual_income
-----+-----
Emily G. Vogel | 999998
James M. McNulty | 999979
(2 rows)

```

Use profile identifiers to query the table for profile information on a given query.

See also

[Profiling single statements](#)

RELEASE SAVEPOINT

Destroys a savepoint without undoing the effects of commands executed after the savepoint was established.

Syntax

```
RELEASE [ SAVEPOINT ] savepoint_name
```

Parameters

savepoint_name

Specifies the name of the savepoint to destroy.

Privileges

None

Notes

Once destroyed, the savepoint is unavailable as a rollback point.

Examples

The following example establishes and then destroys a savepoint called my_savepoint. The values 101 and 102 are both inserted at commit.

```

=> INSERT INTO product_key VALUES (101);
=> SAVEPOINT my_savepoint;
=> INSERT INTO product_key VALUES (102);
=> RELEASE SAVEPOINT my_savepoint;
=> COMMIT;

```

See also

- [SAVEPOINT](#)
- [ROLLBACK TO SAVEPOINT](#)

REPLICATE

Eon Mode only

Copies table or schema data directly from one Eon Mode database's communal storage to another. REPLICATE copies all table data and metadata. Each REPLICATE call can only replicate tables and schemas to a single [namespace](#) in the target database. When called multiple times, this statement only copies data that has changed in the source database since the last call. The tables do not have to exist in the target database before replication. If the table does exist in the target, it is overwritten.

Caution

Replication overwrites any data in the target table. You do not receive any notification that the data in the target database will be overwritten, even if the target table's design does not match the source table. Verify that the tables you want to replicate either do not exist in the target database or do not contain data that you need. Be especially cautious when replicating entire schemas to prevent overwriting data in the target database.

Similarly, changes to a replicated table in the target database are overwritten each time you replicate the table. When performing scheduled replications, only grant read access to replicated tables in the target database. Limiting these tables to read-only access will help prevent confusion if a user makes changes to a replicated table.

Syntax

```
REPLICATE { table | schema | "[.namespace.]schema.table"  
  | INCLUDE "inc_pattern" [ EXCLUDE "ex_pattern" ] }  
{ FROM | TO } database_name  
[ TARGET_NAMESPACE namespace-name ]
```

Arguments

***table* | *schema* | "[.namespace.]schema.table"**

The name of a single table or schema to replicate. If specified, the namespace name must be front-qualified with a period. For example, to specify table *t* in schema *s* in namespace *n*, you would write ".n.s.t". If you do not specify a namespace, the object is assumed to be in the `default_namespace`.

inc_pattern

A string containing a wildcard pattern of the schemas and/or tables to include in the replication. Namespace names must be front-qualified with a period.

ex_pattern

A string containing a wildcard pattern of the schemas and/or tables to exclude from the set of tables matched by the include pattern. Namespace names must be front-qualified with a period.

Note

When using wildcard patterns, be sure to anchor the patterns with a period to indicate the separation between the schema and the table name and between the namespace and schema. For example, suppose you wanted to replicate all tables in the `public` schema in the `n1` namespace that started with the letter `t`, except the table `public.t3`. This pattern statement does not work because the exclude wildcard only applies to schemas:

```
=> REPLICATE INCLUDE ".n1.public.t*" EXCLUDE "*" FROM verticadb;
```

The following statement does work because the periods in the EXCLUDE wildcard force the wildcard to apply to the table:

```
=> REPLICATE INCLUDE ".n1.public.t*" EXCLUDE ".n1.*.t3" FROM verticadb;
```

database_name

The name of the database from or to which data is replicated. The replication steps depend on whether the call is initiated from the source or target database:

- Target-initiated replication: use the [CONNECT TO VERTICA](#) statement to create a connection to the source database, and specify the source database in the REPLICATE statement using a `FROM source_db` clause.
- Source-initiated replication: use the [CONNECT TO VERTICA](#) statement to connect to the target database, and specify the target database in the REPLICATE statement using a `TO target_db` clause.

Both of these methods copy the shard data directly from the source communal storage location to the target communal storage location.

TARGET_NAMESPACE *namespace-name*

Namespace in the target cluster to which objects are replicated. The target namespace must have the same shard count as the source namespace in the source cluster.

If you do not specify a target namespace, objects are replicated to a namespace with the same name as the source namespace. If no such namespace exists in the target cluster, it is created with the same name and shard count as the source namespace. You can only replicate tables in the `public` schema to the `default_namespace` in the target cluster.

Privileges

Superuser

Examples

Connect to the source database from the target database and then replicate the source database's `customers` table to the target database:

```
=> CONNECT TO VERTICA source_db USER dbadmin
      PASSWORD 'mypassword' ON 'vertica_node01', 5433;
CONNECT

=> REPLICATE customers FROM source_db;
REPLICATE
```

The following example performs the same data replication as the previous example, but the following replication is initiated from the source database instead of the target database:

```
=> CONNECT TO VERTICA target_db USER dbadmin
      PASSWORD 'mypassword' ON 'vertica_node01', 5433;
CONNECT

=> REPLICATE customers TO target_db;
REPLICATE
```

Replicate all tables in the **public** schema that start with the letter **t**:

```
=> REPLICATE INCLUDE "public.t*" FROM source_db;
```

Replicate all tables in the **public** schema except those that start with the string **customer_** :

```
=> REPLICATE INCLUDE "public.*" EXCLUDE ".customer_*" FROM source_db;
```

Replicate the **flights** table in the **airline** schema of the **airport** namespace to the **airport2** namespace in the target cluster:

```
=> REPLICATE "*"airport.airline.flights*" FROM source_db TARGET_NAMESPACE airport2;
```

Replicate all schemas and tables in the **default_namespace** of the source database to the **default_namespace** in the target database:

```
=> REPLICATE INCLUDE ".default_namespace.*" FROM source_db;
```

See also

- [REPLICATION_STATUS](#)
- [Server-based replication](#)

REVOKE statements

REVOKE statements let you revoke privileges on database objects from [users](#) and [roles](#).

Important

In a database with trust authentication, REVOKE statements appear to work as expected but have no real effect on database security.

In this section

- [REVOKE \(authentication\)](#)
- [REVOKE \(data loader\)](#)
- [REVOKE \(database\)](#)
- [REVOKE \(key\)](#)
- [REVOKE \(library\)](#)
- [REVOKE \(model\)](#)
- [REVOKE \(procedure\)](#)
- [REVOKE \(Resource pool\)](#)
- [REVOKE \(Role\)](#)
- [REVOKE \(schema\)](#)
- [REVOKE \(sequence\)](#)
- [REVOKE \(storage location\)](#)
- [REVOKE \(table\)](#)
- [REVOKE \(TLS configuration\)](#)
- [REVOKE \(user defined extension\)](#)
- [REVOKE \(view\)](#)
- [REVOKE \(workload\)](#)

REVOKE (authentication)

Revokes privileges on an authentication method from [users](#) and [roles](#).

Syntax

```
REVOKE AUTHENTICATION auth-method-name FROM grantee[,...]
```

Parameters

auth-method-name

Name of the target authentication method.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- [PUBLIC](#): The default role of all users

Privileges

Superuser

Examples

- Revoke [v_ldap](#) authentication from user [jsmith](#) :

```
=> REVOKE AUTHENTICATION v_ldap FROM jsmith;
```

- Revoke [v_gss](#) authentication from the role [DBprogrammer](#) :

```
=> REVOKE AUTHENTICATION v_gss FROM DBprogrammer;
```

- Revoke [localpwd](#) as the default client authentication method:

```
=> REVOKE AUTHENTICATION localpwd FROM PUBLIC;
```

See also

- [ALTER AUTHENTICATION](#)
- [CREATE AUTHENTICATION](#)
- [DROP AUTHENTICATION](#)
- [GRANT \(authentication\)](#)

REVOKE (data loader)

Revokes privileges on automatic data loaders from [users](#) and [roles](#).

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[...] | ALL [ PRIVILEGES ] }  
ON DATA LOADER [schema.]name  
FROM grantee[,...]  
[ CASCADE ]
```

Arguments

privilege

One of the following privileges:

- EXECUTE
- ALTER
- DROP

ALL [PRIVILEGES]

Revokes all privileges.

schema

Schema containing the data loader. The default schema is [public](#).

name

Name of the data loader.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- [PUBLIC](#) : The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through **WITH GRANT OPTION** .

Privileges

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

See also

- [GRANT \(data loader\)](#)
- [Granting and revoking privileges](#)

REVOKE (database)

Revokes database privileges from [users](#) and [roles](#) .

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,...] | ALL [ PRIVILEGES ] }  
ON DATABASE db-spec  
FROM grantee[,...]  
[ CASCADE ]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

privilege

The database privilege to revoke, one of the following:

- **CREATE** : Create schemas.
- **TEMP** : Create temporary tables.

ALL [PRIVILEGES]

Revokes all database privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword **PRIVILEGES** is supported to comply with the SQL standard.

ON DATABASE *db-spec*

Specifies the current database, set to the database name or **DEFAULT** .

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- [PUBLIC](#) : The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through **WITH GRANT OPTION** .

Privileges

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

Examples

Revoke user **Fred** 's privilege to create schemas in the current database:

```
=> REVOKE CREATE ON DATABASE DEFAULT FROM Fred;
```

Revoke user **Fred** 's privilege to create temporary tables in the current database:

```
=> REVOKE TEMP ON DATABASE DEFAULT FROM Fred;
```

See also

- [GRANT \(database\)](#)
- [Granting and revoking privileges](#)

REVOKE (key)

Revokes privileges on a cryptographic key from a user or role.

Important

Because certificates depend on their underlying key, DROP privileges on a key effectively act as DROP privileges on its associated certificate when used with [DROP KEY...CASCADE](#).

To grant privileges on a key, see [GRANT \(key\)](#).

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[...] | ALL [ PRIVILEGES ] } ON KEY
  key_name[...]
FROM user[...]
```

Parameters

`GRANT OPTION FOR`

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

privilege

A privilege, one of the following:

- USAGE: Allows a user to perform the following actions:
 - [View](#) the contents of the key.
 - [Create or sign](#) certificates using the key.

USAGE on the key also gives implicit USAGE privileges on a certificate that uses it as its private key. Users can also get these privileges from ownership of the key or certificate. USAGE privileges on a certificate allow a user to perform the following actions:

- [View](#) the contents of the certificate.
 - Add (with [CREATE](#) or [ALTER](#)) the certificate to a TLS Configuration.
 - Reuse the CA certificate when importing certificates signed by it. For example, if a user imports a chain of certificates **A > B > C** and have USAGE on **B**, the database reuses **B** (as opposed to creating a duplicate of **B**).
 - Specify that the CA certificate signed an imported certificate. For example, if certificate **B** signed certificate **C**, USAGE on **B** allows a user to import **C** and specify that it was [SIGNED BY B](#).
- [DROP](#)
 - ALTER: Allows a user to see the [key](#) and its associated [certificates](#) in their respective system tables, but not their contents.

key_name

The target [key](#).

user

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- [PUBLIC](#): Default role of all users

Privileges

Non-superuser:

- Owner
- Privileges grantee given the option ([WITH GRANT OPTION](#)) of granting privileges to other users or roles.

Examples

The following example revokes DROP privileges on a key (and, by extension, its associated certificate) from a user:

```
=> REVOKE USAGE ON KEY new_key FROM u1;  
REVOKE PRIVILEGE
```

REVOKE (library)

Revokes library privileges from [users](#) and [roles](#).

Syntax

```
REVOKE [ GRANT OPTION FOR ] { USAGE | ALL [ PRIVILEGES ] }  
ON LIBRARY [[database.]schema.]library[,...]  
FROM grantee[,...]  
[ CASCADE ]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

USAGE

Revokes access to the specified libraries.

Important

Privileges on functions in these libraries must be separately revoked.

ALL [PRIVILEGES]

Revokes all library privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack. The optional keyword **PRIVILEGES** conforms with the SQL standard.

[*database* .] *schema*

Database and [schema](#). The default schema is **public**. If you specify a database, it must be the current database.

library

The target library.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- **PUBLIC**: The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through **WITH GRANT OPTION**.

Examples

These commands show how to create a new library, and then grant and revoke user **Fred**'s USAGE privilege on that library.

```
=> CREATE LIBRARY MyFunctions AS 'home/dbadmin/my_functions.so';  
=> GRANT USAGE ON LIBRARY MyFunctions TO Fred;  
=> REVOKE USAGE ON LIBRARY MyFunctions FROM Fred;
```

See also

- [GRANT \(library\)](#)
- [Granting and revoking privileges](#)

REVOKE (model)

Revokes model privileges from [users](#) and [roles](#).

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[...] | ALL [ PRIVILEGES ] }  
ON MODEL [[database.]schema.]model-name [...]  
FROM grantee[,...]  
[ CASCADE ]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

USAGE

One of the following privileges:

- USAGE: Usage of the specified models
- [ALTER](#)
- [DROP](#)

ALL [PRIVILEGES]

Revokes all model privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword **PRIVILEGES** conforms with the SQL standard.

[*database* .] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

model-name

Name of the target model.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- [PUBLIC](#): The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through **WITH GRANT OPTION**.

Privileges

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

Examples

Revoke user **Fred** 's USAGE privilege on model **mySvmClassModel** :

```
=> REVOKE USAGE ON mySvmClassModel FROM Fred;
```

See also

- [GRANT \(model\)](#)
- [Managing model security](#)

REVOKE (procedure)

Revokes procedure privileges from [users](#) and [roles](#).

Syntax

```
REVOKE [ GRANT OPTION FOR ] { EXECUTE | ALL PRIVILEGES }  
ON PROCEDURE [[database.]schema.]procedure( [argument-list] )[,...]  
FROM grantee[,...]  
[ CASCADE ]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

EXECUTE

Revokes grantees ability to run the specified procedures.

ALL [PRIVILEGES]

Revokes all procedure privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword **PRIVILEGES** conforms with the SQL standard.

[*database* .] *schema*

Database and [schema](#). The default schema is **public**. If you specify a database, it must be the current database.

procedure

The target procedure.

argument-list

A comma-delimited list of procedure arguments, where each argument is specified as follows:

```
[argname] argtype
```

If the procedure is defined with no arguments, supply an empty argument list.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- **PUBLIC**: The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through **WITH GRANT OPTION**.

Privileges

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

Examples

This example revokes user **Bob**'s execute privilege on the **tokenize** procedure.

```
=> REVOKE EXECUTE ON PROCEDURE tokenize(varchar) FROM Bob;
```

See also

- [GRANT \(procedure\)](#)
- [Granting and revoking privileges](#)

REVOKE (Resource pool)

Revokes resource pool access privileges from [users](#) and [roles](#).

Vertica checks resource pool privileges at runtime. Revoking a user's privileges for a resource pool can have an immediate effect on the user's current session. For example, a user query might require USAGE privileges on a resource pool. If you revoke those privileges from that user, subsequent attempts by the user to execute that query fail and return with an error message.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { USAGE | ALL PRIVILEGES }  
ON RESOURCE POOL resource-pool[,...]  
[FOR SUBCLUSTER subcluster | FOR CURRENT SUBCLUSTER]  
FROM grantee[,...]  
[ CASCADE ]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

USAGE

Revokes grantee's access to the specified resource pool.

ALL PRIVILEGES

Revokes all resource pool privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword **PRIVILEGES** conforms with the SQL standard.

resource-pool

The target resource pool.

subcluster

The subcluster for the resource pool.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- [PUBLIC](#): The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through **WITH GRANT OPTION**.

Privileges

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

Examples

Revoke user **Joe**'s USAGE privileges on resource pool **Joe_pool**.

```
=> REVOKE USAGE ON RESOURCE POOL Joe_pool FROM Joe;  
REVOKE PRIVILEGE
```

Revoke user **Joe**'s USAGE privileges on resource pool **Joe_pool** for subcluster **sub1**.

```
=> REVOKE USAGE ON RESOURCE POOL Joe_pool FOR SUBCLUSTER sub1 FROM Joe;  
REVOKE PRIVILEGE
```

See also

- [GRANT \(Resource pool\)](#)
- [Granting and revoking privileges](#)

REVOKE (Role)

Revokes a role from [users](#) and [roles](#).

Syntax

```
REVOKE [ ADMIN OPTION FOR ] role[,...]  
FROM grantee[,...]  
[ CASCADE ]
```

Parameters

ADMIN OPTION FOR

Revokes from the grantees the authority to assign the specified roles to other users or roles. Current roles for grantees remain unaffected. If you omit this clause, Vertica revokes role assignment privileges and the current roles.

role

Role to revoke.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- [PUBLIC](#): The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through [WITH GRANT OPTION](#).

Privileges

One of the following:

- Superuser
- Privileges grantee who was given the option ([WITH ADMIN OPTION](#)) of extending these privileges to other users

Examples

This example shows the revocation of the pseudosuperuser role from the dbadmin user:

```
=> REVOKE pseudosuperuser from dbadmin;
```

This example shows the revocation of administration access from the dbadmin user for the pseudosuperuser role. The ADMIN OPTION command does not remove the pseudosuperuser role.

```
=> REVOKE ADMIN OPTION FOR pseudosuperuser FROM dbadmin;
```

Notes

If the role you are trying to revoke was not already granted to the user, Vertica returns a NOTICE:

```
=> REVOKE commentor FROM Sue;
NOTICE 2022: Role "commentor" was not already granted to user "Sue"
REVOKE ROLE
```

See also

- [GRANT \(Role\)](#)
- [Granting and revoking privileges](#)

REVOKE (schema)

Revokes schema privileges from [users](#) and [roles](#).

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[...] | ALL [ PRIVILEGES ] }
  ON SCHEMA [{ namespace. | database. }] schema[...]
  FROM grantee[...]
  [ CASCADE ]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

privilege

The schema privilege to revoke, one of the following:

- USAGE: Access objects in the specified schemas.
- CREATE: Create objects in the specified schemas.

You can also revoke privileges from tables and views that they inherited on creation from this schema. When you revoke inherited privileges at the schema level, Vertica automatically applies the revocation to all tables and views that inherited these privileges.

- SELECT: [Query](#) tables and views. SELECT privileges are granted by default to the PUBLIC role.
- INSERT: [Insert](#) rows, or and load data into tables with [COPY](#).

COPY FROM STDIN is allowed for users with INSERT privileges, while **COPY FROM file** requires admin privileges.

- UPDATE: [Update](#) table rows.
- DELETE: [Delete](#) table rows.
- REFERENCES: Create [foreign key constraints](#) on this table. This privilege must be set on both referencing and referenced tables.
- TRUNCATE: [Truncate](#) table contents. Non-owners of tables can also execute the following partition operations on them:
 - [DROP PARTITIONS](#)
 - [SWAP PARTITIONS BETWEEN TABLES](#)
 - [MOVE PARTITIONS TO TABLE](#)
- ALTER: Modify the DDL of tables and views with [ALTER TABLE](#) and [ALTER VIEW](#), respectively.
- DROP: Drop tables and views.

ALL [PRIVILEGES]

Revokes USAGE AND CREATE privileges. Users cannot revoke privileges that they themselves lack.

The optional keyword **PRIVILEGES** conforms with the SQL standard.

Important

Inherited privileges must be explicitly revoked.

{ **namespace** . | **database** . }

Name of the database or [namespace](#) that contains *schema*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *schema* belongs. If unspecified, the namespace is assumed to be [default_namespace](#).
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#).

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- [PUBLIC](#): The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through **WITH GRANT OPTION**.

Privileges

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

Examples

Revoke user **Joe**'s USAGE privilege on schema **online_sales**.

```
=> REVOKE USAGE ON SCHEMA online_sales FROM Joe;  
REVOKE PRIVILEGE
```

See also

- [GRANT \(schema\)](#)
- [Granting and revoking privileges](#)

REVOKE (sequence)

Revokes sequence privileges from [users](#) and [roles](#).

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[...] | ALL [ PRIVILEGES ] }  
ON {  
  SEQUENCE [[database.]schema.]sequence[,...]  
  | ALL SEQUENCES IN SCHEMA [database.]schema[,...] }  
FROM grantee[,...]  
[ CASCADE ]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

privilege

One of the following privileges:

- SELECT: Execute functions [CURRVAL](#) and [NEXTVAL](#) on the specified sequences.
- ALTER: Modify a sequence's DDL with [ALTER SEQUENCE](#)
- DROP: Drop this sequence with [DROP SEQUENCE](#).

ALL [PRIVILEGES]

Revokes all sequence privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword **PRIVILEGES** is supported to comply with the SQL standard.

[*database.*] *schema*

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

SEQUENCE *sequence*

Specifies the sequence on which to revoke privileges.

ALL SEQUENCES IN SCHEMA *schema*

Revokes the specified privileges on all sequences in schema *schema*.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- [PUBLIC](#): The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through **WITH GRANT OPTION**.

Privileges

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

Examples

Revoke user [Joe](#) 's privileges on sequence [my_seq](#).

```
=> REVOKE ALL PRIVILEGES ON SEQUENCE my_seq FROM Joe;  
REVOKE PRIVILEGE
```

See also

- [GRANT \(sequence\)](#)
- [Granting and revoking privileges](#)

REVOKE (storage location)

Revokes privileges on a USER-defined storage location from [users](#) and [roles](#). For more information, see [Creating storage locations](#).

Note

If the storage location is [dropped](#), Vertica automatically revokes all privileges on it.

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[,...] | ALL [ PRIVILEGES ] }  
ON LOCATION 'path' [ ON node ]  
FROM grantee[,...]  
[ CASCADE ]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

privilege

One of the following privileges:

- **READ** : Copy data from files in the storage location into a table.
- **WRITE** : Export data from the database to the storage location. With **WRITE** privileges, grantees can also save **COPY** statement rejected data and exceptions files to the storage location.

ALL [PRIVILEGES]

Revokes all storage location privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword **PRIVILEGES** is supported to comply with the SQL standard.

ON LOCATION '*path*' [ON *node*]

Specifies the path name mount point of the storage location. If qualified by **ON NODE** , Vertica revokes access to the storage location residing on *node* .

If no node is specified, the revoke operation applies to all nodes on the specified path. All nodes must be on the specified path; otherwise, the entire revoke operation rolls back.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- **PUBLIC** : The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through **WITH GRANT OPTION** .

Privileges

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

Examples

See [GRANT \(storage location\)](#).

See also

[Granting and revoking privileges](#)

REVOKE (table)

Revokes table privileges from [users](#) and [roles](#).

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[...] | ALL [ PRIVILEGES ] }  
ON {  
  [ TABLE ] [{{namespace. | database. }}schema.]table[,...]  
  | ALL TABLES IN SCHEMA [database.]schema[,...] }  
FROM grantee[,...]  
[ CASCADE ]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

privilege

One of the following privileges:

- SELECT: [Query](#) tables. SELECT privileges are granted by default to the PUBLIC role.
- INSERT: Insert table rows with [INSERT](#), and load data with [COPY](#).

Note

[COPY FROM STDIN](#) is allowed for users with INSERT privileges, while [COPY FROM file](#) requires admin privileges.

- UPDATE: [Update](#) table rows.
- DELETE: [Delete](#) table rows.
- REFERENCES: Create [foreign key constraints](#) on this table. This privilege must be set on both referencing and referenced tables.
- TRUNCATE: [Truncate](#) table contents. Non-owners of tables can also execute the following partition operations on them:
 - [DROP PARTITIONS](#)
 - [SWAP PARTITIONS BETWEEN TABLES](#)
 - [MOVE PARTITIONS TO TABLE](#)
- ALTER: Modify a table's DDL with [ALTER TABLE](#).
- DROP: [Drop a table](#).

ALL [PRIVILEGES]

Revokes all table privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword [PRIVILEGES](#) is supported to comply with the SQL standard.

{ *namespace.* | *database.* }

Name of the database or [namespace](#) that contains *table*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be [default_namespace](#).
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#). If you specify the namespace or database name, you must provide the schema name, even if the schema is [public](#).

TABLE *table*

Specifies the table on which to revoke privileges.

ON ALL TABLES IN SCHEMA *schema*

Revokes the specified privileges on all tables and views in schema *schema*.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- [PUBLIC](#): The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through [WITH GRANT OPTION](#).

Privileges

Non-superuser, one of the following:

- Ownership
- [GRANT OPTION](#) on the object

Examples

Revoke user `Joe` 's privileges on table `customer_dimension` .

```
=> REVOKE ALL PRIVILEGES ON TABLE customer_dimension FROM Joe;
REVOKE PRIVILEGE
```

See also

- [GRANT \(table\)](#)
- [Granting and revoking privileges](#)

REVOKE (TLS configuration)

Revokes privileges granted on one or more TLS Configurations from [users](#) and [roles](#) .

Syntax

```
REVOKE [ GRANT OPTION FOR ]
{ ALL | [ privilege[,...] ] }
ON TLS CONFIGURATION tls_configuration[,...]
FROM grantee [,...]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

privilege

A privilege, one of the following:

- USAGE: Allows the user to set the TLS Configuration for a type of connection and view its contents in the system table [TLS_CONFIGURATIONS](#) . For details, see [Security parameters](#) .
- [DROP](#)
- [ALTER](#)

tls_configuration

The TLS Configuration on which to revoke privileges.

grantee

Who is granted privileges, one of the following:

- [user-name](#)
- [role](#)
- [PUBLIC](#) : Default role of all users

Privileges

Non-superusers require [USAGE on the schema](#) and one of the following:

- Owner
- Privileges grantee given the option ([WITH GRANT OPTION](#)) of granting privileges to other users or roles.

Examples

To revoke ALTER privileges on the TLS Configuration `server` from the role `client_server_tls_manager` :

```
=> REVOKE ALTER ON TLS CONFIGURATION server FROM client_server_tls_manager;
```

REVOKE (user defined extension)

Revokes privileges on one or more [user-defined extensions](#) from [users](#) and [roles](#) .

Syntax

```
REVOKE [ GRANT OPTION FOR ] { EXECUTE | ALL PRIVILEGES }  
ON {  
    UDx-type [[database.]schema.]function-name( [argument-list] )[,...]  
    | ALL FUNCTIONS IN SCHEMA schema[,...] }  
FROM grantee[,...]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

EXECUTE

Revokes grantees ability to run the specified functions.

ALL [PRIVILEGES]

Revokes all function privileges that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword **PRIVILEGES** conforms with the SQL standard.

ON *UDx-type*

Specifies the function's user-defined extension (UDx) type, where *UDx-type* is one of the following:

- **FUNCTION**
- **AGGREGATE FUNCTION**
- **ANALYTIC FUNCTION**
- **TRANSFORM FUNCTION**
- **FILTER**
- **PARSER**
- **SOURCE**

[*database* .] *schema*

Database and [schema](#). The default schema is **public**. If you specify a database, it must be the current database.

function-name

The name of the user-defined function on which to revoke privileges.

ON ALL FUNCTIONS IN SCHEMA *schema*

Revokes privileges on all functions in the specified schema.

argument-list

Required for all polymorphic functions, a comma-delimited list of function arguments, where each argument is specified as follows:

```
[argname] argtype
```

If the procedure is defined with no arguments, supply an empty argument list.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- **PUBLIC**: The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through **WITH GRANT OPTION**.

Privileges

Non-superuser, one of the following:

- Owner of the target function
- Privileges grantee who was given the option (**WITH GRANT OPTION**) of extending these privileges to other users

Examples

Revoke **EXECUTE** privileges from user **Bob** on function **myzeroifnull** :

```
=> REVOKE EXECUTE ON FUNCTION myzeroifnull (x INT) FROM Bob;
```

Revoke all privileges from user **Doug** on function **Pagerank** :

```
=> REVOKE ALL ON TRANSFORM FUNCTION Pagerank (t float) FROM Doug;
```

Revoke **EXECUTE** privileges on all functions in the **zero-schema** schema from user Bob:

```
=> REVOKE EXECUTE ON ALL FUNCTIONS IN SCHEMA zero-schema FROM Bob;
```

Revoke **EXECUTE** privileges from user Bob on the **tokenize** function:

```
=> REVOKE EXECUTE ON TRANSFORM FUNCTION tokenize(VARCHAR) FROM Bob;
```

Revoke all privileges on the **ExampleSource()** source from user Alice:

```
=> REVOKE ALL ON SOURCE ExampleSource() FROM Alice;
```

See also

- [GRANT \(User Defined Extension\)](#)
- [Granting and Revoking Privileges](#)
- [Developing user-defined extensions \(UDxs\)](#)

REVOKE (view)

Revokes privileges on a view from [users](#) and [roles](#).

Syntax

```
REVOKE [ GRANT OPTION FOR ] { privilege[...] | ALL [ PRIVILEGES ] }  
ON [[database.]schema.]view[,...]  
FROM grantee[,...]  
[ CASCADE ]
```

Parameters

GRANT OPTION FOR

Revokes the grant option for the specified privileges. Current privileges for grantees remain unaffected. If you omit this clause, Vertica revokes both the grant option and current privileges.

privilege

One of the following:

- SELECT: Query the specified views.
- ALTER: Modify a view's DDL with [ALTER VIEW](#)
- DROP: Drop this view with [DROP VIEW](#).

ALL PRIVILEGES

Revokes all privileges that pertain to views that also belong to the revoker. Users cannot revoke privileges that they themselves lack.

The optional keyword **PRIVILEGES** conforms with the SQL standard.

[*database*.] *schema*

Database and [schema](#). The default schema is **public**. If you specify a database, it must be the current database.

view

The view on which to revoke privileges.

grantee

Whose privileges are revoked, one of the following:

- [User name](#)
- [Role](#)
- **PUBLIC**: The default role of all users

CASCADE

Revoke privileges from users who received them from the grantee through **WITH GRANT OPTION**.

Examples

Revoke SELECT privileges from user [Joe](#) on view [test_view](#) .

```
=> REVOKE SELECT ON test_view FROM Joe;  
REVOKE PRIVILEGE
```

See also

- [GRANT \(view\)](#)
- [Granting and revoking privileges](#)

REVOKE (workload)

Revokes privileges from a [user](#) or [role](#) to use a [workload](#)

Syntax

```
REVOKE USAGE ON WORKLOAD workload FROM {user | role}
```

Parameters

workload

A workload defined by a [routing rule](#). For details, see [Workload routing](#) .

user* | *role

The [user](#) or [role](#) to revoke privileges from.

Privileges

Superuser

Examples

The following example revokes the USAGE privilege on the [analytics](#) workload from users with the [analytics_role](#) role:

```
=> REVOKE USAGE ON WORKLOAD analytics FROM analytics_role;
```

Similarly, this example revokes the USAGE privilege on the [analytics](#) workload from the user [jacob](#) :

```
=> REVOKE USAGE ON WORKLOAD analytics FROM jacob;
```

For more examples, see [Workload routing](#) .

ROLLBACK

Ends the current transaction and discards all changes that occurred during the transaction.

Syntax

```
ROLLBACK [ WORK | TRANSACTION ]
```

Parameters

WORK | TRANSACTION

Have no effect; they are optional keywords for readability.

Privileges

None

Notes

When an operation is rolled back, any locks that are acquired by the operation are also rolled back.

ABORT is a synonym for ROLLBACK.

Examples

This example shows how to roll back from a DELETE transaction.

```
=> SELECT * FROM sample_table;
```

```
a  
---  
1  
(1 row)
```

```
=> DELETE FROM sample_table WHERE a = 1;
```

```
=> SELECT * FROM sample_table;
```

```
a  
---  
(0 rows)
```

```
=> ROLLBACK;
```

```
=> SELECT * FROM sample_table;
```

```
a  
---  
1  
(1 row)
```

This example shows how to roll back the changes you made since the BEGIN statement.

```
=> BEGIN TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;
```

```
BEGIN
```

```
=> ROLLBACK TRANSACTION;
```

```
ROLLBACK
```

See also

- [Transactions](#)
- [Creating and rolling back transactions](#)
- [BEGIN](#)
- [COMMIT](#)
- [END](#)
- [START TRANSACTION](#)

ROLLBACK TO SAVEPOINT

Rolls back all commands that have been entered within the transaction since the given savepoint was established.

Syntax

```
ROLLBACK TO [SAVEPOINT] savepoint_name
```

Parameters

savepoint_name

Specifies the name of the savepoint to roll back to.

Privileges

None

Notes

- The savepoint remains valid and can be rolled back to again later if needed.
- When an operation is rolled back, any locks that are acquired by the operation are also rolled back.
- ROLLBACK TO SAVEPOINT implicitly destroys all savepoints that were established after the named savepoint.

Examples

The following example rolls back the values 102 and 103 that were entered after the savepoint, `my_savepoint`, was established. Only the values 101 and 104 are inserted at commit.

```
=> INSERT INTO product_key VALUES (101);
=> SAVEPOINT my_savepoint;
=> INSERT INTO product_key VALUES (102);
=> INSERT INTO product_key VALUES (103);
=> ROLLBACK TO SAVEPOINT my_savepoint;
=> INSERT INTO product_key VALUES (104);
=> COMMIT;
```

See also

- [RELEASE SAVEPOINT](#)
- [SAVEPOINT](#)

SAVE QUERY

Saves an input query to associate with a custom directed query.

Syntax

```
SAVE QUERY input-query
```

Arguments

input-query

The input query to associate with a custom directed query. The input query supports only one optimizer hint, [.v.](#)

Privileges

[Superuser](#)

Usage

SAVE QUERY saves the specified input query for use by the next invocation of [CREATE DIRECTED QUERY CUSTOM](#). CREATE DIRECTED QUERY CUSTOM pairs the saved query with its annotated query argument to create a directed query. Both statements must be issued in the same user session.

The saved query remains available until the one of the following events occurs:

- The next invocation of CREATE DIRECTED QUERY, whether invoked with CUSTOM or OPTIMIZER.
- Another invocation of SAVE QUERY.
- The session ends.

Caution

Vertica associates a saved query with a directed query without checking whether the input and annotated queries are compatible. Be careful to sequence SAVE QUERY and CREATE DIRECTED QUERY CUSTOM so the saved and directed queries are correctly matched.

Examples

See [Custom directed queries](#).

SAVEPOINT

Creates a special mark, called a savepoint, inside a transaction. A savepoint allows all commands that are executed after it was established to be rolled back, restoring the transaction to the state it was in at the point in which the savepoint was established.

Tip

Savepoints are useful when creating nested transactions. For example, a savepoint could be created at the beginning of a subroutine. That way, the result of the subroutine could be rolled back if necessary.

Syntax

```
SAVEPOINT savepoint_name
```

Parameters

savepoint_name

Specifies the name of the savepoint to create.

Privileges

None

Notes

- Savepoints are local to a transaction and can only be established when inside a transaction block.
- Multiple savepoints can be defined within a transaction.
- If a savepoint with the same name already exists, it is replaced with the new savepoint.

Examples

The following example illustrates how a savepoint determines which values within a transaction can be rolled back. The values 102 and 103 that were entered after the savepoint, `my_savepoint`, was established are rolled back. Only the values 101 and 104 are inserted at commit.

```
=> INSERT INTO T1 (product_key) VALUES (101);
=> SAVEPOINT my_savepoint;
=> INSERT INTO T1 (product_key) VALUES (102);
=> INSERT INTO T1 (product_key) VALUES (103);
=> ROLLBACK TO SAVEPOINT my_savepoint;
=> INSERT INTO T1 (product_key) VALUES (104);
=> COMMIT;
=> SELECT product_key FROM T1;
.
.
101
104
(2 rows)
```

See also

- [RELEASE SAVEPOINT](#)
- [ROLLBACK TO SAVEPOINT](#)

SELECT

Returns a result set from one or more data sources— [tables](#), [views](#), [joined tables](#), and named [subqueries](#).

Syntax

```
[ AT epoch ] [ WITH-clause ] SELECT [ ALL | DISTINCT ]
  { * | { MATCH\_COLUMNS('pattern') | expression [ [AS] alias ] },[...] }
  [ into-table-clause ]
  [ from-clause ]
  [ where-clause ]
  [ time-series-clause ]
  [ group-by-clause[,...] ]
  [ having-clause[,...] ]
  [ match-clause ]
  [ union-clause ]
  [ intersect-clause ]
  [ except-clause ]
  [ order-by-clause [ offset-clause ] ]
  [ limit-clause ]
  [ FOR UPDATE [ OF table-name[,...] ] ]
```

Note

SELECT statements can also embed various directives, or [hints](#), that let you control how a given query is handled—for example, join hints such as [JTYPE](#), which enforces the join type (merge or hash join).

For details on using Vertica hints, see [Hints](#).

Parameters

AT *epoch*

Returns data from the specified epoch, where *epoch* is one of the following:

- EPOCH LATEST : Return data up to but not including the current epoch. The result set includes data from the latest committed DML transaction.
- EPOCH *integer* : Return data up to and including the *integer*-specified epoch.
- TIME '*timestamp*' : Return data from the *timestamp*-specified epoch.

Note

These options are ignored if used to query temporary or external tables.

See [Epochs](#) for additional information about how Vertica uses epochs.

For details, see [Historical queries](#).

ALL | DISTINCT

- ALL (default): Retains duplicate rows in result set or group.
- DISTINCT : Removes duplicate rows from the result set or group.

The ALL or DISTINCT qualifier must immediately follow the SELECT keyword. Only one instance of this keyword can appear in the select list.

*

Lists all columns in the queried tables.

Caution

Selecting all columns from the queried tables can produce a very large wide set, which can adversely affect performance.

[MATCH COLUMNS](#) (' *pattern* ')

Returns all columns in the queried tables that match *pattern* .

expression [[AS] *alias*]

An expression that typically resolves to column data from the queried tables—for example, names of [columns](#) that are specified in the FROM clause; also:

- [Literals](#) (constants)
- [Aggregate expressions](#)
- [CASE expressions](#)
- [SQL functions](#)
- Subqueries in the SELECT list

You can optionally assign a temporary alias to each column expression and reference that alias elsewhere in the SELECT statement—for example, in the query predicate or ORDER BY clause. Vertica uses the alias as the column heading in query output.

FOR UPDATE

Specifies to obtain an X lock on all tables specified in the query, most often used from [READ COMMITTED](#) isolation.

[FOR UPDATE](#) requires update/delete permissions on the queried tables and cannot be issued from a read-only transaction.

Privileges

Non-superusers:

- USAGE on the schema
- SELECT on the table or view

Note

As view owner, you can grant other users SELECT privilege on the view only if one of the following is true:

- You own the view's base table.
- You have SELECT...WITH GRANT OPTION privilege on the view's base table.

Examples

When multiple clients run transactions as in the following example query, deadlocks can occur if **FOR UPDATE** is not used. Two transactions acquire an S lock, and when both attempt to upgrade to an X lock, they encounter deadlocks:

```
=> SELECT balance FROM accounts WHERE account_id=3476 FOR UPDATE;
...
=> UPDATE accounts SET balance = balance+10 WHERE account_id=3476;
=> COMMIT;
```

See also

- [LOCKS](#)
- [Analytic functions](#)
- [SQL analytics](#)
- [Time series analytics](#)
- [Event series pattern matching](#)
- [Subqueries](#)
- [Joins](#)

In this section

- [EXCEPT clause](#)
- [FROM clause](#)
- [GROUP BY clause](#)
- [HAVING clause](#)
- [INTERSECT clause](#)
- [INTO TABLE clause](#)
- [LIMIT clause](#)
- [MATCH clause](#)
- [MINUS clause](#)
- [OFFSET clause](#)
- [ORDER BY clause](#)
- [TIMESERIES clause](#)
- [UNION clause](#)
- [WHERE clause](#)
- [WITH clause](#)

EXCEPT clause

Combines two or more SELECT queries. EXCEPT returns distinct results of the left-hand query that are not also found in the right-hand query.

Note

MINUS is an alias for EXCEPT.

Syntax

```
SELECT
  EXCEPT except-query[...]
  [ ORDER BY { column-name | ordinal-number } [ ASC | DESC ] [...]]
  [ LIMIT { integer | ALL } ]
  [ OFFSET integer ]
```

Notes

- Use the EXCEPT clause to filter out specific results from a SELECT statement. The EXCEPT query operates on the results of two or more SELECT queries. It returns only those rows in the left-hand query that are not also present in the right-hand query.
- Vertica evaluates multiple EXCEPT clauses in the same SELECT query from left to right, unless parentheses indicate otherwise.
- You cannot use the ALL keyword with an EXCEPT query.
- The results of each SELECT statement must be union compatible. Each statement must return the same number of columns, and the corresponding columns must have compatible data types. For example, you cannot use the EXCEPT clause on a column of type INTEGER and a column of type VARCHAR. If statements do not meet these criteria, Vertica returns an error.

Note

The [Data type coercion chart](#) lists the data types that can be cast to other data types. If one data type can be cast to the other, those two

data types are compatible.

- You can use EXCEPT in FROM, WHERE, and HAVING clauses.
- You can order the results of an EXCEPT operation by including an ORDER BY operation in the statement. When you write the ORDER BY list, specify the column names from the leftmost SELECT statement, or specify integers that indicate the position of the columns by which to sort.
- The rightmost ORDER BY, LIMIT, or OFFSET clauses in an EXCEPT query do not need to be enclosed in parentheses, because the rightmost query specifies that Vertica perform the operation on the results of the EXCEPT operation. Any ORDER BY, LIMIT, or OFFSET clauses contained in SELECT queries that appear earlier in the EXCEPT query must be enclosed in parentheses.
- Vertica supports EXCEPT [noncorrelated subquery](#) predicates. For example:

```
=> SELECT * FROM T1
WHERE T1.x IN
(SELECT MAX(c1) FROM T2
EXCEPT
SELECT MAX(cc1) FROM T3
EXCEPT
SELECT MAX(d1) FROM T4);
```

Examples

Consider the following three tables:

Company_A

Id	emp_lname	dept	sales
1234	Stephen	auto parts	1000
5678	Alice	auto parts	2500
9012	Katherine	floral	500
3214	Smithson	sporting goods	1500

(4 rows)

Company_B

Id	emp_lname	dept	sales
4321	Marvin	home goods	250
8765	Bob	electronics	20000
9012	Katherine	home goods	500
3214	Smithson	home goods	1500

(4 rows)

Company_C

Id	emp_lname	dept	sales
3214	Smithson	sporting goods	1500
5432	Madison	sporting goods	400
7865	Cleveland	outdoor	1500
1234	Stephen	floral	1000

(4 rows)

The following query returns the IDs and last names of employees that exist in Company_A, but not in Company_B:

```
=> SELECT id, emp_lname FROM Company_A
EXCEPT
SELECT id, emp_lname FROM Company_B;
id | emp_lname
-----+-----
1234 | Stephen
5678 | Alice
(2 rows)
```

The following query sorts the results of the previous query by employee last name:

```
=> SELECT id, emp_lname FROM Company_A
EXCEPT
SELECT id, emp_lname FROM Company_B
ORDER BY emp_lname ASC;
id | emp_lname
-----+-----
5678 | Alice
1234 | Stephen
(2 rows)
```

If you order by the column position, the query returns the same results:

```
=> SELECT id, emp_lname FROM Company_A
EXCEPT
SELECT id, emp_lname FROM Company_B
ORDER BY 2 ASC;
id | emp_lname
-----+-----
5678 | Alice
1234 | Stephen
(2 rows)
```

The following query returns the IDs and last names of employees that exist in Company_A, but not in Company_B or Company_C:

```
=> SELECT id, emp_lname FROM Company_A
EXCEPT
SELECT id, emp_lname FROM Company_B
EXCEPT
SELECT id, emp_lname FROM Company_C;
id | emp_lname
-----+-----
5678 | Alice
(1 row)
```

The following query shows the results of mismatched data types:

```
=> SELECT id, emp_lname FROM Company_A
EXCEPT
SELECT emp_lname, id FROM Company_B;
ERROR 3429: For 'EXCEPT', types int and varchar are inconsistent
DETAIL: Columns: id and emp_lname
```

Using the [VMart](#) example database, the following query returns information about all Connecticut-based customers who bought items through stores and whose purchases amounted to more than \$500, except for those customers who paid cash:

```
=> SELECT customer_key, customer_name FROM public.customer_dimension
WHERE customer_key IN (SELECT customer_key FROM store.store_sales_fact
WHERE sales_dollar_amount > 500
EXCEPT
SELECT customer_key FROM store.store_sales_fact
WHERE tender_type = 'Cash')
AND customer_state = 'CT';
customer_key | customer_name
```

```

46495 | Kevin H. Taylor
```

(10 rows)

See also

- [SELECT](#)
- [INTERSECT clause](#)
- [UNION clause](#)
- [Subqueries](#)

FROM clause

A comma-separated list of data sources to query.

Syntax

```
FROM dataset[,...] [ TABLESAMPLE(percent) ]
```

Parameters

dataset ``

A set of data to query, one of the following:

- [Table reference](#)
- [Joined tables](#)
- [View](#)
- Named [subquery](#): *subquery* [AS] *name*

TABLESAMPLE(*percent*)

Specifies to return a random sampling of records, where *percent* specifies the approximate sampling size. The *percent* value must be between 0 and 100, exclusive, and can include decimal values. The number of records returned is not guaranteed to be the exact percentage specified.

All rows of the data have equal opportunities to be selected. Vertica performs sampling before applying other query filters.

Examples

Count all records in [customer_dimension](#) table:

```
=> SELECT COUNT(*) FROM customer_dimension;
COUNT
-----
50000
(1 row)
```

Return a small sampling of rows in table [customer_dimension](#) :

```
=> SELECT customer_name, customer_state FROM customer_dimension TABLESAMPLE(0.5) WHERE customer_state='IL';
```

```
customer_name | customer_state
```

```

```

In this section

- [Joined-table](#)
- [Table-reference](#)

Joined-table

Specifies how to join tables.

Syntax

```
table-reference [ join-type ] JOIN table-reference [ TABLESAMPLE(percent) ] [ ON join-predicate ]
```

Arguments

table-reference

A [table name, optionally qualified](#).

join-type

One of the following:

- [INNER](#) (default). **INNER JOIN** is equivalent to a query that specifies its join predicate in a **WHERE** clause.
- [LEFT \[OUTER \]](#)
- [RIGHT \[OUTER \]](#)
- [FULL \[OUTER \]](#)
- [NATURAL](#)
- [CROSS](#)

TABLESAMPLE(*percent*)

Use simple random sampling to return an approximate percentage of records. The percentage value must be greater than 0 and less than 100. All rows in the total potential return set are equally eligible to be included in the sampling. Vertica performs this sampling before other filters in the query are applied. The number of records returned is not guaranteed to be exactly *percent*.

The **TABLESAMPLE** option is valid only with user-defined tables and Data Collector (DC) tables. Views and system tables are not supported.

ON *join-predicate*

Specifies the [columns to join on](#). Invalid for **NATURAL** and **CROSS** joins, required for all other join types.

Alternative JOIN syntax options

Vertica supports two older join syntax conventions:

- Table joins specified by join predicate in a **WHERE** clause
- Table joins specified by a **USING** clause

For details, see [Join Syntax](#).

Examples

The following **SELECT** statement qualifies its **JOIN** clause with the **TABLESAMPLE** option:

```
=> SELECT user_id.id, user_name.name FROM user_name TABLESAMPLE(50)
      JOIN user_id TABLESAMPLE(50) ON user_name.id = user_id.id;
 id | name
-----+-----
 489 | Markus
2234 | Cato
 763 | Pompey
(3 rows)
```

Table-reference

Syntax

```
[[database.]schema.]table[ [AS] alias]
```

Parameters

[database .] schema

Database and [schema](#). The default schema is [public](#). If you specify a database, it must be the current database.

table

A table in the logical schema.

[AS] alias

A temporary name used for references to [table](#).

GROUP BY clause

Use the [GROUP BY](#) clause with aggregate functions in a [SELECT](#) statement to collect data across multiple records. Vertica groups the results into one or more sets of rows that match an expression.

The [GROUP BY](#) clause without aggregates is similar to using [SELECT DISTINCT](#).

[ROLLUP](#) is an extension to the [GROUP BY](#) clause. [ROLLUP](#) performs subtotal aggregations.

Syntax

```
GROUP BY [/*+GBYTYPE(algorithm)*/] { expression | aggregate-expression }[,...]
```

Arguments

/*+ GBYTYPE (*algorithm*)*/

Specifies which algorithm has precedence for implementing this [GROUP BY](#) clause, over the algorithm the Vertica query optimizer might otherwise choose. You can set *algorithm* to one of the following values:

- **HASH** : [GROUPBY HASH](#) algorithm
- **PIPE** : [GROUPBY PIPELINED](#) algorithm

For more information about both algorithms, see [GROUP BY implementation options](#).

expression

Any expression, including constants and column references in the tables specified in the [FROM clause](#). For example:

```
column,... column, (expression)
```

aggregate-expression

An ordered list of columns, expressions, [CUBE](#), [GROUPING SETS](#), or [ROLLUP](#) aggregates.

You can include [CUBE](#) and [ROLLUP](#) aggregates within a [GROUPING SETS](#) aggregate. [CUBE](#) and [ROLLUP](#) aggregates can result in a large amount of output. In that case, use [GROUPING SETS](#) to return only certain results.

You cannot include any aggregates within a [CUBE](#) or [ROLLUP](#) expression.

You can append multiple [GROUPING SETS](#), [CUBE](#), or [ROLLUP](#) aggregates in the same query. For example:

```
GROUP BY a,b,c,d, ROLLUP(a,b)
GROUP BY a,b,c,d, CUBE((a,b),c,d)
GROUP BY a,b,c,d, CUBE(a,b), ROLLUP (c,d)
GROUP BY ROLLUP(a), CUBE(b), GROUPING SETS(c)
GROUP BY a,b,c,d, GROUPING SETS ((a,d),(b,c),CUBE(a,b))
GROUP BY a,b,c,d, GROUPING SETS ((a,d),(b,c),(a,b),(a),(b),())
```

Usage considerations

- *expression* cannot include [aggregate functions](#). However, you can use the GROUP BY clause with CUBE, GROUPING SETS, and **ROLLUP** to return summary values for each group.
- When you create a GROUP BY clause, you must include all non-aggregated columns that appear in the **SELECT** list.
- If the **GROUP BY** clause includes a **WHERE** clause, Vertica ignores all rows that do not satisfy the **WHERE** clause.

Examples

This example shows how to use the **WHERE** clause with **GROUP BY**. In this case, the example retrieves all employees whose last name begins with S, and ignores all rows that do not meet this criteria. The **GROUP BY** clause uses the **ILIKE** function to retrieve only last names beginning with S. The aggregate function **SUM** computes the total vacation days for each group.

```
=> SELECT employee_last_name, SUM(vacation_days)
FROM employee_dimension
WHERE employee_last_name ILIKE 'S%'
GROUP BY employee_last_name;
employee_last_name | SUM
-----+-----
Sanchez            | 2892
Smith              | 2672
Stein              | 2660
(3 rows)
```

The **GROUP BY** clause in the following example groups results by vendor region, and vendor region's biggest deal:

```
=> SELECT vendor_region, MAX(deal_size) AS "Biggest Deal"
FROM vendor_dimension
GROUP BY vendor_region;
vendor_region | Biggest Deal
-----+-----
East          | 990889
MidWest       | 699163
NorthWest     | 76101
South         | 854136
SouthWest     | 609807
West          | 964005
(6 rows)
```

The following query modifies the previous one with a **HAVING** clause, which specifies to return only groups whose maximum deal size exceeds \$900,000:

```
=> SELECT vendor_region, MAX(deal_size) as "Biggest Deal"
FROM vendor_dimension
GROUP BY vendor_region
HAVING MAX(deal_size) > 900000;
vendor_region | Biggest Deal
-----+-----
East          | 990889
West          | 964005
(2 rows)
```

You can use the **GROUP BY** clause with one-dimensional arrays of scalar types. In the following example, grants is an **ARRAY[VARCHAR]** and grant_values is an **ARRAY[INT]**.

```
=> SELECT department, grants, SUM(apply_sum(grant_values))
   FROM employees
   GROUP BY grants, department;
department | grants | SUM
-----+-----+-----
Physics | ["US-7376","DARPA-1567"] | 235000
Astronomy | ["US-7376","DARPA-1567"] | 9000
Physics | ["US-7376"] | 30000
(3 rows)
```

The **GROUP BY** clause without aggregates is similar to using **SELECT DISTINCT** . For example, the following two queries return the same results:

```
=> SELECT DISTINCT household_id FROM customer_dimension;
=> SELECT household_id FROM customer_dimension GROUP BY household_id;
```

See also

- [CUBE aggregate](#)
- [GROUP_ID](#)
- [GROUPING](#)
- [GROUPING_ID](#)
- [GROUPING SETS aggregate](#)
- [ROLLUP](#)

In this section

- [CUBE aggregate](#)
- [GROUPING SETS aggregate](#)
- [ROLLUP aggregate](#)

CUBE aggregate

Automatically performs all possible aggregations of the specified columns, as an extension to the [GROUP BY](#) clause.

You can use the ROLLUP clause with three grouping functions:

- [GROUPING](#)
- [GROUP_ID](#)
- [GROUPING_ID](#)

Syntax

```
GROUP BY group-expression[,...]
```

Parameters

group-expression ``

One or both of the following:

- An expression that is not an aggregate or a grouping function that includes constants and column references in **FROM** -specified tables. For example:

```
column1, (column2+1), column3+column4
```

- A multilevel expression, one of the following:
 - **ROLLUP**
 - **CUBE**
 - **GROUPING SETS**

Restrictions

- GROUP BY CUBE does not order data. If you want to sort data, use the [ORDER BY clause](#) . The ORDER BY clause must come *after* the GROUP BY clause.
- You can use CUBE inside a GROUPING SETS expression, but not inside a ROLLUP expression or another CUBE expression.

Levels of CUBE aggregation

If n is the number of grouping columns, CUBE creates 2^n levels of aggregations. For example:

CUBE (A, B, C) creates all possible groupings, resulting in eight groups:

- (A, B, C)
- (A, B)
- (A, C)
- (B, C)
- (A)
- (B)
- (C)
- ()

If you increase the number of CUBE columns, the number of CUBE groupings increases exponentially. The CUBE query may be resource intensive and produce combinations that are not of interest. In that case, consider using the [GROUPING SETS aggregate](#), which allows you to choose specific groupings.

Examples

Using CUBE to return all groupings

Suppose you have a table that contains information about family expenses for books and electricity:

```
=> SELECT * FROM expenses ORDER BY Category, Year;
```

Year	Category	Amount
2005	Books	39.98
2007	Books	29.99
2008	Books	29.99
2005	Electricity	109.99
2006	Electricity	109.99
2007	Electricity	229.98

To aggregate the data by both Category and Year using the CUBE aggregate:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses
GROUP BY CUBE(Category, Year) ORDER BY 1, 2, GROUPING_ID();
```

Category	Year	SUM
Books	2005	39.98
Books	2007	29.99
Books	2008	29.99
Books		99.96
Electricity	2005	109.99
Electricity	2006	109.99
Electricity	2007	229.98
Electricity		449.96
	2005	149.97
	2006	109.99
	2007	259.97
	2008	29.99
		549.92

The results include subtotals for each category and year, and a grand total (\$549.92).

Using CUBE with the HAVING clause

This example shows how you can restrict the GROUP BY results, use the HAVING clause with the CUBE aggregate. This query returns only the category totals and the full total:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses
GROUP BY CUBE(Category,Year) HAVING GROUPING(Year)=1;
```

Category	Year	SUM
Books		99.96
Electricity		449.96
		549.92

The next query returns only the aggregations for the two categories for each year. The GROUPING ID function specifies to omit the grand total (\$549.92):

```
=> SELECT Category, Year, SUM (Amount) FROM expenses
   GROUP BY CUBE(Category,Year) HAVING GROUPING_ID(Category,Year)<2
   ORDER BY 1, 2, GROUPING_ID();
```

```
Category | Year | SUM
```

```
-----+-----+-----
Books    | 2005 | 39.98
Books    | 2007 | 29.99
Books    | 2008 | 29.99
Books    |      | 99.96
Electrical | 2005 | 109.99
Electrical | 2006 | 109.99
Electrical | 2007 | 229.98
Electrical |      | 449.96
```

See also

- [Data aggregation](#)
- [GROUP BY clause](#)
- [GROUP_ID](#)
- [GROUPING](#)
- [GROUPING_ID](#)
- [GROUPING SETS aggregate](#)
- [ROLLUP aggregate](#)

GROUPING SETS aggregate

The **GROUPING SETS** aggregate is an extension to the [GROUP BY](#) clause that automatically performs subtotal aggregations on groupings that you specify.

You can use the **GROUPING SETS** clause with three grouping functions:

- [GROUPING](#)
- [GROUP_ID](#)
- [GROUPING_ID](#)

To sort data, use the [ORDER BY](#) clause. The **ORDER BY** clause must follow the **GROUP BY** clause.

Syntax

```
GROUP BY group-expression[,...]
```

Parameters

group-expression ``

One or both of the following:

- An expression that is not an aggregate or a grouping function that includes constants and column references in **FROM** -specified tables. For example:
`column1, (column2+1), column3+column4`
- A multilevel expression, one of the following:
 - **ROLLUP**
 - **CUBE**
 - **GROUPING SETS**

Defining the groupings

GROUPING SETS allows you to specify exactly which groupings you want in the results. You can also concatenate the groupings as follows:

The following example clauses result in the groupings shown.

This clause...	Defines groupings...
<code>...GROUP BY GROUPING SETS(A,B,C,D)...</code>	(A), (B), (C), (D)
<code>...GROUP BY GROUPING SETS((A),(B),(C),(D))...</code>	(A), (B), (C), (D)

...GROUP BY GROUPING SETS((A,B,C,D))...	(A, B, C, D)
...GROUP BY GROUPING SETS(A,B),GROUPING SETS(C,D)...	(A, C), (B, C), (A, D), (B, C)
...GROUP BY GROUPING SETS((A,B)),GROUPING SETS(C,D)...	(A, B, C), (A, B, D)
...GROUP BY GROUPING SETS(A,B),GROUPING SETS(ROLLUP(C,D))...	(A,B), (A,B,C), (A,B,C,D)
...GROUP BY A,B,C,GROUPING SETS(ROLLUP(C, D))...	(A, B, C, D), (A, B, C), (A, B, C) The clause contains two groups (A, B, C). In the HAVING clause, use the GROUP_ID function as a predicate, to eliminate the second grouping.

Example: selecting groupings

This example shows how to select only those groupings you want. Suppose you want to aggregate on columns only, and you do not need the grand total. The first query omits the total. In the second query, you add () to the GROUPING SETS list to get the total. Use the ORDER BY clause to sort the results by grouping:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses
GROUP BY GROUPING SETS((Category, Year), (Year))
ORDER BY 1, 2, GROUPING_ID();
Category | Year | SUM
```

```
-----+-----+-----
Books   | 2005 | 39.98
Books   | 2007 | 29.99
Books   | 2008 | 29.99
Electrical | 2005 | 109.99
Electrical | 2006 | 109.99
Electrical | 2007 | 229.98
        | 2005 | 149.97
        | 2006 | 109.99
        | 2007 | 259.97
        | 2008 | 29.99
```

```
=> SELECT Category, Year, SUM(Amount) FROM expenses
GROUP BY GROUPING SETS((Category, Year), (Year), ())
ORDER BY 1, 2, GROUPING_ID();
Category | Year | SUM
```

```
-----+-----+-----
Books   | 2005 | 39.98
Books   | 2007 | 29.99
Books   | 2008 | 29.99
Electrical | 2005 | 109.99
Electrical | 2006 | 109.99
Electrical | 2007 | 229.98
        | 2005 | 149.97
        | 2006 | 109.99
        | 2007 | 259.97
        | 2008 | 29.99
        |     | 549.92
```

See also

- [Data aggregation](#)
- [CUBE aggregate](#)
- [GROUPING](#)
- [GROUP_ID](#)
- [GROUPING_ID](#)

- [GROUP BY clause](#)
- [ROLLUP aggregate](#)

ROLLUP aggregate

Automatically performs subtotal aggregations as an extension to the [GROUP BY](#) clause. **ROLLUP** performs these aggregations across multiple dimensions, at different levels, within a single SQL query.

You can use the **ROLLUP** clause with three grouping functions:

- [GROUPING](#)
- [GROUP_ID](#)
- [GROUPING_ID](#)

Syntax

ROLLUP *grouping-expression* [...]

Parameters

group-expression

One or both of the following:

- An expression that is not an aggregate or a grouping function that includes constants and column references in **FROM** -specified tables. For example:
`column1, (column2+1), column3+column4`
- A multilevel expression, one of the following:
 - **ROLLUP**
 - **CUBE**
 - **GROUPING SETS**

Restrictions

GROUP BY ROLLUP does not sort results. To sort data, an [ORDER BY clause](#) must follow the **GROUP BY** clause.

Levels of aggregation

If n is the number of grouping columns, **ROLLUP** creates $n + 1$ levels of subtotals and grand total. Because **ROLLUP** removes the right-most column at each step, specify column order carefully.

Suppose that **ROLLUP(A, B, C)** creates four groups:

- (A, B, C)
- (A, B)
- (A)
- ()

Because **ROLLUP** removes the right-most column at each step, there are no groups for (A, C) and (B, C) .

If you enclose two or more columns in parentheses, **GROUP BY** treats them as a single entity. For example:

- **ROLLUP(A, B, C)** creates four groups:

```
(A, B, C)
(A, B)
(A)
()
```

- **ROLLUP((A, B), C)** treats (A, B) as a single entity and creates three groups:

```
(A, B, C)
(A, B)
()
```

Example: aggregating the full data set

The following example shows how to use the **GROUP BY** clause to determine family expenses for electricity and books over several years. The **SUM** aggregate function computes the total amount of money spent in each category per year.

Suppose you have a table that contains information about family expenses for books and electricity:

```
=> SELECT * FROM expenses ORDER BY Category, Year;
```

Year	Category	Amount
2005	Books	39.98
2007	Books	29.99
2008	Books	29.99
2005	Electricity	109.99
2006	Electricity	109.99
2007	Electricity	229.98

For the `expenses` table, `ROLLUP` computes the subtotals in each category between 2005–2007:

- Books: \$99.96
- Electricity: \$449.96
- Grand total: \$549.92.

Use the `ORDER BY` clause to sort the results:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses  
GROUP BY ROLLUP(Category, Year) ORDER BY 1,2, GROUPING_ID();
```

Category	Year	SUM
Books	2005	39.98
Books	2007	29.99
Books	2008	29.99
Books		99.96
Electricity	2005	109.99
Electricity	2006	109.99
Electricity	2007	229.98
Electricity		449.96
		549.92

Example: using `ROLLUP` with the `HAVING` clause

This example shows how to use the `HAVING` clause with `ROLLUP` to restrict the `GROUP BY` results. The following query produces only those `ROLLUP` categories where `year` is subtotaled, based on the expression in the `GROUPING` function:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses  
GROUP BY ROLLUP(Category,Year) HAVING GROUPING(Year)=1  
ORDER BY 1, 2, GROUPING_ID();
```

Category	Year	SUM
Books		99.96
Electricity		449.96
		549.92

The next example rolls up on (`Category` , `Year`), but not on the full results. The `GROUPING_ID` function specifies to aggregate less than three levels:

```
=> SELECT Category, Year, SUM(Amount) FROM expenses  
GROUP BY ROLLUP(Category,Year) HAVING GROUPING_ID(Category,Year)<3  
ORDER BY 1, 2, GROUPING_ID();
```

Category	Year	SUM
Books	2005	39.98
Books	2007	29.99
Books	2008	29.99
Books		99.96
Electricity	2005	109.99
Electricity	2006	109.99
Electricity	2007	229.98
Electricity		449.96

- [GROUP_ID](#)
- [GROUPING_ID](#)
- [GROUP BY clause](#)
- [GROUPING SETS aggregate](#)

HAVING clause

Filters the results of a [GROUP BY clause](#). Semantically, the HAVING clause occurs after the GROUP BY operation. It was added to the SQL standard because a [WHERE clause](#) cannot specify [aggregate functions](#).

Syntax

```
HAVING condition[,...]
```

Parameters

condition

Unambiguously references a grouping column, unless the reference appears in an aggregate function.

Examples

The following example returns the employees with salaries greater than \$800,000:

```
=> SELECT employee_last_name, MAX(annual_salary) as highest_salary FROM employee_dimension
   GROUP BY employee_last_name HAVING MAX(annual_salary) > 800000 ORDER BY highest_salary DESC;
employee_last_name | highest_salary
```

```
-----+-----
Sanchez           |    992363
Vogel             |    983634
Vu                |    977716
Lewis             |    957949
Taylor            |    953373
King              |    937765
Gauthier          |    927335
Garnett           |    903104
Bauer             |    901181
Jones             |    885395
Rodriguez         |    861647
Young             |    846657
Greenwood         |    837543
Overstreet        |    831317
Garcia            |    811231
(15 rows)
```

INTERSECT clause

Calculates the intersection of the results of two or more SELECT queries. INTERSECT returns distinct values by both the query on the left and right sides of the INTERSECT operand.

Syntax

```
select-stmt
INTERSECT query[...]
 [ order-by-clause [ offset-clause ] ]
 [ limit-clause ]
```

Notes

- Use the INTERSECT clause to return all elements that are common to the results of all the SELECT queries. The INTERSECT query operates on the results of two or more SELECT queries. INTERSECT returns only the rows that are returned by all the specified queries.
- You cannot use the ALL keyword with an INTERSECT query.
- The results of each SELECT query must be union compatible; they must return the same number of columns, and the corresponding columns must have compatible data types. For example, you cannot use the INTERSECT clause on a column of type INTEGER and a column of type VARCHAR. If the SELECT queries do not meet these criteria, Vertica returns an error.

Note

The [Data type coercion chart](#) lists the data types that can be cast to other data types. If one data type can be cast to the other, those two data types are compatible.

- Order the results of an INTERSECT operation by using an ORDER BY clause. In the ORDER BY list, specify the column names from the leftmost SELECT statement or specify integers that indicate the position of the columns by which to sort.
- You can use INTERSECT in FROM, WHERE, and HAVING clauses.
- The rightmost ORDER BY, LIMIT, or OFFSET clauses in an INTERSECT query do not need to be enclosed in parentheses because the rightmost query specifies that Vertica perform the operation on the results of the INTERSECT operation. Any ORDER BY, LIMIT, or OFFSET clauses contained in SELECT queries that appear earlier in the INTERSECT query must be enclosed in parentheses.
- The order by column names is from the first select.
- Vertica supports INTERSECT noncorrelated subquery predicates. For example:

```
=> SELECT * FROM T1
WHERE T1.x IN
(SELECT MAX(c1) FROM T2
INTERSECT
SELECT MAX(cc1) FROM T3
INTERSECT
SELECT MAX(d1) FROM T4);
```

Examples

Consider the following three tables:

Company_A

id	emp_lname	dept	sales
1234	Stephen	auto parts	1000
5678	Alice	auto parts	2500
9012	Katherine	floral	500
3214	Smithson	sporting goods	1500

Company_B

id	emp_lname	dept	sales
4321	Marvin	home goods	250
9012	Katherine	home goods	500
8765	Bob	electronics	20000
3214	Smithson	home goods	1500

Company_C

id	emp_lname	dept	sales
3214	Smithson	sporting goods	1500
5432	Madison	sporting goods	400
7865	Cleveland	outdoor	1500
1234	Stephen	floral	1000

The following query returns the IDs and last names of employees that exist in both Company_A and Company_B:

```
=> SELECT id, emp_lname FROM Company_A
INTERSECT
SELECT id, emp_lname FROM Company_B;
id | emp_lname
-----+-----
3214 | Smithson
9012 | Katherine
(2 rows)
```

The following query returns the same two employees in descending order of sales:

```
=> SELECT id, emp_lname, sales FROM Company_A
INTERSECT
SELECT id, emp_lname, sales FROM Company_B
ORDER BY sales DESC;
id | emp_lname | sales
-----+-----+-----
3214 | Smithson | 1500
9012 | Katherine | 500
(2 rows)
```

The following query returns the employee who works for both companies whose sales in Company_B are greater than 1000:

```
=> SELECT id, emp_lname, sales FROM Company_A
INTERSECT
(SELECT id, emp_lname, sales FROM company_B WHERE sales > 1000)
ORDER BY sales DESC;
id | emp_lname | sales
-----+-----+-----
3214 | Smithson | 1500
(1 row)
```

In the following query returns the ID and last name of the employee who works for all three companies:

```
=> SELECT id, emp_lname FROM Company_A
INTERSECT
SELECT id, emp_lname FROM Company_B
INTERSECT
SELECT id, emp_lname FROM Company_C;
id | emp_lname
-----+-----
3214 | Smithson
(1 row)
```

The following query shows the results of a mismatched data types; these two queries are not union compatible:

```
=> SELECT id, emp_lname FROM Company_A
INTERSECT
SELECT emp_lname, id FROM Company_B;
ERROR 3429: For 'INTERSECT', types int and varchar are inconsistent
DETAIL: Columns: id and emp_lname
```

Using the [VMart](#) example database, the following query returns information about all Connecticut-based customers who bought items online and whose purchase amounts were between \$400 and \$500:

```
=> SELECT customer_key, customer_name from public.customer_dimension
WHERE customer_key IN (SELECT customer_key
FROM online_sales.online_sales_fact
WHERE sales_dollar_amount > 400
INTERSECT
SELECT customer_key FROM online_sales.online_sales_fact
WHERE sales_dollar_amount > 500)
AND customer_state = 'CT' ORDER BY customer_key;
```

```
customer_key | customer_name
```

```
-----+-----
39 | Sarah S. Winkler
44 | Meghan H. Overstreet
70 | Jack X. Cleveland
103 | Alexandra I. Vu
110 | Matt . Farmer
173 | Mary R. Reyes
188 | Steve G. Williams
233 | Theodore V. McNulty
250 | Marcus E. Williams
294 | Samantha V. Young
313 | Meghan P. Pavlov
375 | Sally N. Vu
384 | Emily R. Smith
387 | Emily L. Garcia
...
```

The previous query and the next one are equivalent, and return the same results:

```
=> SELECT customer_key, customer_name FROM public.customer_dimension
WHERE customer_key IN (SELECT customer_key
FROM online_sales.online_sales_fact
WHERE sales_dollar_amount > 400
AND sales_dollar_amount < 500)
AND customer_state = 'CT' ORDER BY customer_key;
```

INTO TABLE clause

Creates a table from a query result set.

Syntax

Permanent table:

```
INTO [TABLE] [{namespace. | database.}]schema.table
```

Temporary table:

```
INTO [scope] TEMP[ORARY] [TABLE] [database.schema].table
[ ON COMMIT { DELETE | PRESERVE } ROWS ]
```

Parameters

scope

Specifies visibility of a temporary table definition:

- **GLOBAL** (default): The table definition is visible to all sessions, and persists until you explicitly drop the table.
- **LOCAL** : The table definition is visible only to the session in which it is created, and is dropped when the session ends.

Regardless of this setting, retention of temporary table data is set by the keywords **ON COMMIT DELETE ROWS** and **ON COMMIT PRESERVE ROWS** (see below).

For more information, see [Creating temporary tables](#).

{ **namespace.** | **database.** }

Name of the database or [namespace](#) that contains *table*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be [default_namespace](#).
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#). If you specify the namespace or database name, you must provide the schema name, even if the schema is [public](#).

table

The name of the table to create.

ON COMMIT { DELETE | PRESERVE } ROWS

Specifies whether data is transaction- or session-scoped:

- **DELETE** (default) marks the temporary table for transaction-scoped data. Vertica removes all table data after each commit.
- **PRESERVE** marks the temporary table for session-scoped data, which is preserved beyond the lifetime of a single transaction. Vertica removes all table data when the session ends.

Examples

The following **SELECT** statement has an **INTO TABLE** clause that creates table *newTable* from *customer_dimension*:

```
=> SELECT * INTO TABLE newTable FROM customer_dimension;
```

The following **SELECT** statement creates temporary table *newTempTable*. By default, temporary tables are created at a global scope, so its definition is visible to other sessions and persists until it is explicitly dropped. No *customer_dimension* data is copied into the new table, and Vertica issues a warning accordingly:

```
=> SELECT * INTO TEMP TABLE newTempTable FROM customer_dimension;  
WARNING 4102: No rows are inserted into table "public"."newTempTable" because  
ON COMMIT DELETE ROWS is the default for create temporary table  
HINT: Use "ON COMMIT PRESERVE ROWS" to preserve the data in temporary table  
CREATE TABLE
```

The following **SELECT** statement creates local temporary table *newTempTableLocal*. This table is visible only to the session in which it was created, and is automatically dropped when the session ends. The **INTO TABLE** clause includes **ON COMMIT PRESERVE ROWS**, so Vertica copies all selection data into the new table:

```
=> SELECT * INTO LOCAL TEMP TABLE newTempTableLocal ON COMMIT PRESERVE ROWS  
FROM customer_dimension;  
CREATE TABLE
```

LIMIT clause

Specifies the maximum number of result set rows to return, either from the entire result set, or from windows of a partitioned result set.

```
LIMIT { num-rows OVER ( PARTITION BY partition-expr[,...] ORDER BY order-expr[,...] )  
| ALL }
```

Arguments

num-rows

The maximum number of rows to return.

OVER()

Specifies how to partition and sort input data with respect to the current row. The input data is the result set that the query returns after it evaluates FROM, WHERE, GROUP BY, and HAVING clauses.

For details, see [Using LIMIT with Window Partitioning](#) below.

partition-expr

Column or expression returning a column to partition results by.

order-expr [ASC | DESC] [NULLS { FIRST | LAST }]

Column or expression returning the column to order results by. Each column can be sorted in ascending (default) or descending order, with

nulls first or last.

ALL

Returns all rows, valid only when LIMIT is applied to the entire result set.

Limiting returned rows

LIMIT returns the specified number of rows from the queried dataset. Row precedence is determined by the query's [ORDER BY clause](#). If you do not use an ORDER BY clause, the query returns an undefined subset of the result set.

When a SELECT statement specifies both LIMIT and [OFFSET](#), Vertica first processes the OFFSET, and then applies LIMIT to the remaining rows.

The following query returns the first 10 rows of data, as ordered first by region and then by number of employees:

```
--> SELECT store_region, store_city||', '||store_state location, store_name, number_of_employees
FROM store.store_dimension WHERE number_of_employees <= 12
ORDER BY store_region, number_of_employees LIMIT 10;
store_region | location | store_name | number_of_employees
-----+-----+-----+-----
East | Stamford, CT | Store219 | 12
East | New Haven, CT | Store66 | 12
East | New York, NY | Store122 | 12
MidWest | South Bend, IN | Store134 | 10
MidWest | Evansville, IN | Store30 | 11
MidWest | Green Bay, WI | Store27 | 12
South | Mesquite, TX | Store124 | 10
South | Cape Coral, FL | Store18 | 11
South | Beaumont, TX | Store226 | 11
South | Houston, TX | Store33 | 11
(10 rows)
```

Using LIMIT with window partitioning

You can use LIMIT to apply window partitioning on query results and limit the number of rows that are returned in each window.

For example, the following query specifies window partitioning on the result set. LIMIT is set to 2, so each window partition can return no more than two rows. The [OVER](#) clause partitions the result set by `store_region`, so in each region the query returns the two stores with the smallest number of employees:

```
--> SELECT store_region, store_city||', '||store_state location, store_name, number_of_employees
FROM store.store_dimension
LIMIT 2
OVER (PARTITION BY store_region ORDER BY number_of_employees ASC);
store_region | location | store_name | number_of_employees
-----+-----+-----+-----
West | Norwalk, CA | Store43 | 10
West | Lancaster, CA | Store95 | 11
East | Stamford, CT | Store219 | 12
East | New York, NY | Store122 | 12
SouthWest | North Las Vegas, NV | Store170 | 10
SouthWest | Phoenix, AZ | Store228 | 11
NorthWest | Bellevue, WA | Store200 | 19
NorthWest | Portland, OR | Store39 | 22
MidWest | South Bend, IN | Store134 | 10
MidWest | Evansville, IN | Store30 | 11
South | Mesquite, TX | Store124 | 10
South | Beaumont, TX | Store226 | 11
(12 rows)
```

MATCH clause

A SQL extension that lets you screen large amounts of historical data in search of event patterns, the MATCH clause provides subclasses for analytic partitioning and ordering and matches rows from the result table based on a pattern you define.

You specify a pattern as a regular expression, which is composed of event types defined in the DEFINE subclause, where each event corresponds to a row in the input table. Then you can search for the pattern within a sequence of input events. Pattern matching returns the contiguous sequence of rows that conforms to PATTERN subclause. For example, pattern P (A B* C) consist of three event types: A, B, and C. When Vertica finds a match in the input table, the associated pattern instance must be an event of type A followed by 0 or more events of type B, and an event of type C.

Pattern matching is particularly useful for clickstream analysis where you might want to identify users' actions based on their Web browsing behavior (page clicks). For details, see [Event series pattern matching](#).

Syntax

```
MATCH ( [ PARTITION BY table-column ] ORDER BY table-column
  DEFINE event-name AS boolean-expr [... ]
  PATTERN pattern-name AS ( regex )
  [ rows-match-clause ] )
```

Arguments

PARTITION BY

Defines the window data scope in which the pattern, defined in the PATTERN subclause, is matched. The partition clause partitions the data by matched patterns defined in the PATTERN subclause. For each partition, data is sorted by the ORDER BY clause. If the partition clause is omitted, the entire data set is considered a single partition.

ORDER BY

Defines the window data scope in which the pattern, defined in the PATTERN subclause, is matched. For each partition, the order clause specifies how the input data is ordered for pattern matching.

Note

The ORDER BY clause is mandatory.

DEFINE

Defines the [boolean](#) expressions that make up the event types in the regular expressions. For example:

```
DEFINE
Entry AS RefURL NOT ILIKE '%website2.com%' AND PageURL ILIKE
      '%website2.com%',
Onsite AS PageURL ILIKE '%website2.com%' AND Action='V',
Purchase AS PageURL ILIKE '%website2.com%' AND Action='P'
```

The DEFINE subclause accepts a maximum of 52 events. See [Event series pattern matching](#) for examples.

event-name

Name of the event to evaluate for each row—in the earlier example, [Entry](#), [Onsite](#), [Purchase](#) .

Note

Event names are case insensitive and follow the same naming conventions as those used for tables and columns.

boolean-expr

Expression that returns true or false. *boolean_expr* can include [Logical operators](#) and relational ([comparison](#)) operators. For example:

```
Purchase AS PageURL ILIKE '%website2.com%' AND Action = 'P'
```

PATTERN *pattern-name*

Name of the pattern defined in the PATTERN subclause; for example, P is the pattern name defined below:

```
PATTERN P AS (...)
```

A PATTERN is a *search pattern* that is comprised of a name and a regular expression.

Note

Vertica supports one pattern per query.

regexp

A regular expression comprised of event types defined in the **DEFINE** subclause and one or more quantifiers below. When Vertica evaluates the **MATCH** clause, the regular expression identifies the rows that meet the expression criteria.

- ***** : Match 0 or more times
- ***?** : Match 0 or more times, not greedily
- **+** : Match 1 or more times
- **+?** : Match 1 or more times, not greedily
- **?** : Match 0 or 1 time
- **??** : Match 0 or 1 time, not greedily
- ***+** : Match 0 or more times, possessive
- **++** : Match 1 or more times, possessive
- **?+** : Match 0 or 1 time, possessive
- **|** : Alternation. Matches expression before or after the vertical bar. Similar to a Boolean OR.

rows-match-clause

Specifies how to resolve more than one event evaluating to true for a single row, one of the following:

- **ROWS MATCH ALL EVENTS** : If more than one event evaluates to true for a single row, Vertica returns this error :

```
ERROR: pattern events must be mutually exclusive
HINT: try using ROWS MATCH FIRST EVENT
```
- **ROWS MATCH FIRST EVENT** : If more than one event evaluates to true for a given row, Vertica uses the first event in the SQL statement for that row.

Pattern semantic evaluation

- The semantic evaluating ordering of the SQL clauses is: FROM -> WHERE -> PATTERN MATCH -> SELECT.
- Data is partitioned as specified in the PARTITION BY clause. If the partition clause is omitted, the entire data set is considered a single partition.
- For each partition, the order clause specifies how the input data is ordered for pattern matching.
- Events are evaluated for each row. A row could have 0, 1, or *N* events evaluate to true. If more than one event evaluates to true for the same row, Vertica returns a run-time error unless you specify ROWS MATCH FIRST EVENT. If you specify ROWS MATCH FIRST EVENT and more than one event evaluates to TRUE for a single row, Vertica chooses the event that was defined first in the SQL statement to be the event it uses for the row.
- Vertica performs pattern matching by finding the contiguous sequence of rows that conforms to the pattern defined in the PATTERN subclause.

For each match, Vertica outputs the rows that contribute to the match. Rows not part of the match (do not satisfy one or more predicates) are not output.

- Vertica reports only non-overlapping matches. If an overlap occurs, Vertica chooses the first match found in the input stream. After finding the match, Vertica looks for the next match, starting at the end of the previous match.
- Vertica reports the longest possible match, not a subset of a match. For example, consider pattern: *A B with input: AAAB. Because A uses the greedy regular expression quantifier (), Vertica reports all A inputs (AAAB), not AAB, AB, or B.*

Notes and restrictions

- DISTINCT and GROUP BY/HAVING clauses are not allowed in pattern match queries.
- The following expressions are not allowed in the DEFINE subclause:
 - Subqueries, such as **DEFINE X AS c IN ELECT c FROM table**
 - Analytic functions, such as **DEFINE X AS c < LEA1) OVER (ORDER BY 1)**
 - Aggregate functions, such as **DEFINE X AS c < MA1)**
- You cannot use the same pattern name to define a different event; for example, the following is not allowed for X:

```
DEFINE X AS c1 < 3
X AS c1 >= 3
```

- Used with MATCH clause, Vertica [MATCH clause functions](#) provide additional data about the patterns it finds. For example, you can use the functions to return values representing the name of the event that matched the input row, the sequential number of the match, or a partition-wide unique identifier for the instance of the pattern that matched.

Examples

For examples, see [Event series pattern matching](#).

See also

- [MATCH clause functions](#)
- [EVENT_NAME](#)
- [MATCH_ID](#)

- [PATTERN_ID](#)

In this section

- [Event series pattern matching](#)

Event series pattern matching

The SQL [MATCH clause](#) syntax lets you screen large amounts of historical data in search of event patterns. You specify a pattern as a regular expression and can then search for the pattern within a sequence of input events. MATCH provides subclauses for analytic data partitioning and ordering, and the pattern matching occurs on a contiguous set of rows.

Pattern matching is particularly useful for clickstream analysis where you might want to identify users' actions based on their Web browsing behavior (page clicks). A typical online clickstream funnel is:

Company home page -> product home page -> search -> results -> purchase online

Using this clickstream funnel, you can search for a match on the user's sequence of web clicks and identify that user:

- Landed on the company home page
- Navigated to the product page
- Ran a search
- Clicked a link from the search results
- Made a purchase

Clickstream funnel schema

The examples in this topic use this clickstream funnel and the following [clickstream_log](#) table schema:

```
=> CREATE TABLE clickstream_log (
  uid INT,          --user ID
  sid INT,          --browsing session ID, produced by previous sessionization computation
  ts TIME,          --timestamp that occurred during the user's page visit
  refURL VARCHAR(20), --URL of the page referencing PageURL
  pageURL VARCHAR(20), --URL of the page being visited
  action CHAR(1)    --action the user took after visiting the page ('P' = Purchase, 'V' = View)
);

INSERT INTO clickstream_log VALUES (1,100,'12:00','website1.com','website2.com/home', 'V');
INSERT INTO clickstream_log VALUES (1,100,'12:01','website2.com/home','website2.com/floby', 'V');
INSERT INTO clickstream_log VALUES (1,100,'12:02','website2.com/floby','website2.com/shamwow', 'V');
INSERT INTO clickstream_log values (1,100,'12:03','website2.com/shamwow','website2.com/buy', 'P');
INSERT INTO clickstream_log values (2,100,'12:10','website1.com','website2.com/home', 'V');
INSERT INTO clickstream_log values (2,100,'12:11','website2.com/home','website2.com/forks', 'V');
INSERT INTO clickstream_log values (2,100,'12:13','website2.com/forks','website2.com/buy', 'P');
COMMIT;
```

Here's the clickstream_log table's output:

```
=> SELECT * FROM clickstream_log;
uid | sid | ts | refURL | pageURL | action
-----+-----+-----+-----+-----+-----
 1 | 100 | 12:00:00 | website1.com | website2.com/home | V
 1 | 100 | 12:01:00 | website2.com/home | website2.com/floby | V
 1 | 100 | 12:02:00 | website2.com/floby | website2.com/shamwow | V
 1 | 100 | 12:03:00 | website2.com/shamwow | website2.com/buy | P
 2 | 100 | 12:10:00 | website1.com | website2.com/home | V
 2 | 100 | 12:11:00 | website2.com/home | website2.com/forks | V
 2 | 100 | 12:13:00 | website2.com/forks | website2.com/buy | P
(7 rows)
```

Examples

This example includes the Vertica [MATCH clause functions](#) to analyze users' browsing history over website2.com. It identifies patterns where the user performed the following tasks:

- Landed on website2.com from another web site (Entry)

- Browsed to any number of other pages (Onsite)
- Made a purchase (Purchase)

In the following statement, pattern P (**Entry Onsite* Purchase**) consist of three event types: Entry, Onsite, and Purchase. When Vertica finds a match in the input table, the associated pattern instance must be an event of type Entry followed by 0 or more events of type Onsite, and an event of type Purchase

```
=> SELECT uid,
       sid,
       ts,
       refurl,
       pageurl,
       action,
       event_name(),
       pattern_id(),
       match_id()
FROM clickstream_log
MATCH
(PARTITION BY uid, sid ORDER BY ts
DEFINE
Entry AS RefURL NOT ILIKE '%website2.com%' AND PageURL ILIKE '%website2.com%',
Onsite AS PageURL ILIKE '%website2.com%' AND Action='V',
Purchase AS PageURL ILIKE '%website2.com%' AND Action = 'P'
PATTERN
P AS (Entry Onsite* Purchase)
ROWS MATCH FIRST EVENT);
```

In the output below, the first four rows represent the pattern for user 1's browsing activity, while the following three rows show user 2's browsing habits.

uid	sid	ts	refurl	pageurl	action	event_name	pattern_id	match_id
1	100	12:00:00	website1.com	website2.com/home	V	Entry	1	1
1	100	12:01:00	website2.com/home	website2.com/floby	V	Onsite	1	2
1	100	12:02:00	website2.com/floby	website2.com/shamwow	V	Onsite	1	3
1	100	12:03:00	website2.com/shamwow	website2.com/buy	P	Purchase	1	4
2	100	12:10:00	website1.com	website2.com/home	V	Entry	1	1
2	100	12:11:00	website2.com/home	website2.com/forks	V	Onsite	1	2
2	100	12:13:00	website2.com/forks	website2.com/buy	P	Purchase	1	3

(7 rows)

See also

- [MATCH clause](#)
- [MATCH clause functions](#)

MINUS clause

MINUS is an alias for [EXCEPT](#).

OFFSET clause

Omits a specified number of rows from the beginning of the result set.

Syntax

```
OFFSET rows
```

Parameters

start-row

Specifies the first row to include in the result set. All preceding rows are omitted.

Dependencies

- Use an [ORDER BY clause](#) with OFFSET. Otherwise, the query returns an undefined subset of the result set.
- OFFSET must follow the [ORDER BY clause](#) in a SELECT statement or UNION clause.

- When a SELECT statement or UNION clause specifies both [LIMIT](#) and OFFSET, Vertica first processes the OFFSET statement, and then applies the LIMIT statement to the remaining rows.

Examples

The following query returns 14 rows from the [customer_dimension](#) table:

```
=> SELECT customer_name, customer_gender FROM customer_dimension
WHERE occupation='Dancer' AND customer_city = 'San Francisco' ORDER BY customer_name;
customer_name | customer_gender
-----+-----
Amy X. Lang   | Female
Anna H. Li    | Female
Brian O. Weaver | Male
Craig O. Pavlov | Male
Doug Z. Goldberg | Male
Harold S. Jones | Male
Jack E. Perkins | Male
Joseph W. Overstreet | Male
Kevin . Campbell | Male
Raja Y. Wilson | Male
Samantha O. Brown | Female
Steve H. Gauthier | Male
William . Nielson | Male
William Z. Roy | Male
(14 rows)
```

If you modify the previous query to specify an offset of 8 ([OFFSET 8](#)), Vertica skips the first eight rows of the previous result set. The query returns the following results:

```
=> SELECT customer_name, customer_gender FROM customer_dimension
WHERE occupation='Dancer' AND customer_city = 'San Francisco' ORDER BY customer_name OFFSET 8;
customer_name | customer_gender
-----+-----
Kevin . Campbell | Male
Raja Y. Wilson | Male
Samantha O. Brown | Female
Steve H. Gauthier | Male
William . Nielson | Male
William Z. Roy | Male
(6 rows)
```

ORDER BY clause

Sorts a query result set on one or more columns or column expressions. Vertica uses the current locale and collation sequence to compare and sort string values.

Note

Vertica projection data is always stored sorted by the ASCII (binary) collating sequence.

Syntax

```
ORDER BY expression [ ASC | DESC ] [...]
```

Parameters

expression

One of the following:

- Name or [ordinal number](#) of a SELECT list item. The ordinal number refers to the position of the result column, counting from the left beginning at one. Use them to order by a column whose name is not unique. Ordinal numbers are invalid for an ORDER BY clause of an analytic function's [OVER clause](#).
- Arbitrary expression formed from columns that do not appear in the [SELECT](#) list
- [CASE](#) expression.

Note

You cannot use DISTINCT on a collection column if it is also included in the sort order.

ASC | DESC

Specifies whether to sort values in ascending or descending order. NULL values are either first or last in the sort order, depending on data type:

- INTEGER, INT, DATE/TIME: NULL has the smallest value.
- FLOAT, BOOLEAN, CHAR, VARCHAR, ARRAY, SET: NULL has the largest value

Examples

The follow example returns all the city and deal size for customer Metamedia, sorted by deal size in descending order.

```
=> SELECT customer_city, deal_siz FROM customer_dimension WHERE customer_name = 'Metamedia'
   ORDER BY deal_size DESC;
customer_city | deal_size
-----+-----
El Monte     | 4479561
Athens       | 3815416
Ventura      | 3792937
Peoria       | 3227765
Arvada       | 2671849
Coral Springs | 2643674
Fontana      | 2374465
Rancho Cucamonga | 2214002
Wichita Falls | 2117962
Beaumont     | 1898295
Arvada       | 1321897
Waco         | 1026854
Joliet       | 945404
Hartford    | 445795
(14 rows)
```

The following example uses a transform function. It returns an error because the ORDER BY column is not in the window partition.

```
=> CREATE TABLE t(geom geometry(200), geog geography(200));
=> SELECT PolygonPoint(geom) OVER(PARTITION BY geom)
   AS SEL_0 FROM t ORDER BY geog;
ERROR 2521: Cannot specify anything other than user defined transforms and partitioning expressions in the ORDER BY list
```

The following example, using the same table, corrects this error.

```
=> SELECT PolygonPoint(geom) OVER(PARTITION BY geom)
   AS SEL_0 FROM t ORDER BY geom;
```

The following example uses an array in the ORDER BY clause.

```
=> SELECT * FROM employees
   ORDER BY grant_values;
id | department | grants | grant_values
---+-----+-----+-----
36 | Astronomy | ["US-7376","DARPA-1567"] | [5000,4000]
36 | Physics | ["US-7376","DARPA-1567"] | [10000,25000]
33 | Physics | ["US-7376"] | [30000]
42 | Physics | ["US-7376","DARPA-1567"] | [65000,135000]
(4 rows)
```

TIMESERIES clause

Provides gap-filling and interpolation (GFI) computation, an important component of time series analytics computation. See [Time series analytics](#) for details and examples.

Syntax

```
TIMESERIES slice-time AS 'length-and-time-unit-expr' OVER (  
  [ PARTITION BY column-expr[,...] ] ORDER BY time-expr ) [ ORDER BY table-column[,...] ]
```

Parameters

slice-time

A time column produced by the **TIMESERIES** clause, which stores the time slice start times generated from gap filling.

Note: This parameter is an alias, so you can use any name that an alias would take.

length-and-time-unit-expr

An **INTERVAL DAY TO SECOND** literal that specifies the length of time unit of time slice computation. For example:

```
`TIMESERIES slice_time AS '3 seconds' ...
```

OVER()

Specifies partitioning and ordering for the function. **OVER()** also specifies that the time series function operates on a query result set—that is, the rows that are returned after the **FROM**, **WHERE**, **GROUP BY**, and **HAVING** clauses are evaluated.

PARTITION BY (*column-expr* '[,...]')

Partitions the data by the specified column expressions. [Gap filling and interpolation](#) is performed on each partition separately.

ORDER BY *time-expr*

Sorts the data by the **TIMESTAMP** expression *time-expr*, which computes the time information of the time series data.

Note

The **TIMESERIES** clause requires an **ORDER BY** operation on the timestamp column.

Notes

If the *window-partition-clause* is not specified in **TIMESERIES OVER()**, for each defined time slice, exactly one output record is produced; otherwise, one output record is produced per partition per time slice. Interpolation is computed there.

Given a query block that contains a **TIMESERIES** clause, the following are the semantic phases of execution (after evaluating the **FROM** and the optional **WHERE** clauses):

1. Compute *time-expression*.
2. Perform the same computation as the **TIME_SLICE()** function on each input record based on the result of *time-exp* and '*length-and-time-unit-expr*'.
 1. Perform gap filling to generate time slices missing from the input.
 2. Name the result of this computation as *slice_time*, which represents the generated "time series" column (alias) after gap filling.
3. Partition the data by *expression*, *slice-time*. For each partition, do step 4.
4. Sort the data by *time-expr*. Interpolation is computed here.

There is semantic overlap between the **TIMESERIES** clause and the **TIME_SLICE** function with the following key differences:

- **TIMESERIES** only supports the [interval qualifier DAY TO SECOND](#); it does not allow **YEAR TO MONTH**.
- Unlike **TIME_SLICE**, the time slice length and time unit expressed in **length-and-time-unit-expr** must be constants so gaps in the time slices are well-defined.
- **TIMESERIES** performs gap filling; the **TIME_SLICE** function does not.
- **TIME_SLICE** can return the start or end time of a time slice, depending on the value of its fourth input parameter (*start-or-end*). **TIMESERIES**, on the other hand, always returns the start time of each time slice. To output the end time of each time slice, write a **SELECT** statement like the following:

```
=> SELECT slice_time + <slice_length>;
```

Restrictions

- When the **TIMESERIES** clause occurs in a SQL query block, only the following clauses can be used in the same query block:
 - **SELECT**
 - **FROM**
 - **WHERE**
 - **ORDER BY**

GROUP BY and **HAVING** clauses are not allowed. If a **GROUP BY** operation is needed before or after gap-filling and interpolation (GFI), use a subquery and place the **GROUP BY** in the outer query. For example:

```
=> SELECT symbol, AVG(first_bid) as avg_bid FROM (
  SELECT symbol, slice_time, TS_FIRST_VALUE(bid1) AS first_bid
  FROM Tickstore
  WHERE symbol IN ('MSFT', 'IBM')
  TIMESERIES slice_time AS '5 seconds' OVER (PARTITION BY symbol ORDER BY ts)
  ) AS resultOfGFI
GROUP BY symbol;
```

- When the **TIMESERIES** clause is present in the SQL query block, the **SELECT** list can include only the following:
 - Time series aggregate functions such as [TS_FIRST_VALUE](#) and [TS_LAST_VALUE](#)
 - *slice_time* column
 - **PARTITION BY** expressions
 - [TIME_SLICE](#) function

For example, the following two queries return a syntax error because **bid1** is not a **PARTITION BY** or **GROUP BY** column:

```
=> SELECT bid, symbol, TS_FIRST_VALUE(bid) FROM Tickstore
  TIMESERIES slice_time AS '5 seconds' OVER (PARTITION BY symbol ORDER BY ts);
ERROR: column "Tickstore.bid" must appear in the PARTITION BY list of Timeseries clause or be used in a Timeseries Output function
=> SELECT bid, symbol, AVG(bid) FROM Tickstore
  GROUP BY symbol;
ERROR: column "Tickstore.bid" must appear in the GROUP BY clause or be used in an aggregate function
```

Examples

For examples, see [Gap filling and interpolation \(GFI\)](#).

See also

- [TIME_SLICE](#)
- [TS_FIRST_VALUE](#)
- [TS_LAST_VALUE](#)
- [Gap filling and interpolation \(GFI\)](#)

UNION clause

Combines the results of multiple SELECT statements. You can include UNION in [FROM](#), [WHERE](#), and [HAVING](#) clauses.

Syntax

```
select { UNION [ ALL | DISTINCT ] select }[...]  
  [ order-by-clause [ offset-clause ] ]  
  [ limit-clause ]
```

Arguments

select

A [SELECT](#) statement that returns one or more rows, depending on whether you specify keywords DISTINCT or ALL.

The first SELECT statement can include the [LABEL](#) hint. Vertica ignores LABEL hints in subsequent SELECT statements.

Each SELECT statement can specify its own [ORDER BY](#), [LIMIT](#), and [OFFSET](#) clauses. A SELECT statement with one or more of these clauses must be enclosed by parentheses. See also: [ORDER BY, LIMIT, and OFFSET Clauses in UNION](#).

DISTINCT , ALL

How to return duplicate rows:

- DISTINCT (default) returns only unique rows.
- ALL concatenates all rows, including duplicates. For best performance, use UNION ALL.

UNION ALL supports columns of complex types; UNION DISTINCT does not.

Requirements

- Each row of the UNION result set must be in the result set of at least one of its SELECT statements.
- Each SELECT statement must specify the same number of columns.
- Data types of corresponding SELECT statement columns must be [compatible](#), otherwise Vertica returns an error.

ORDER BY, LIMIT, and OFFSET clauses in UNION

A UNION statement can specify its own [ORDER BY](#), [LIMIT](#), and [OFFSET](#) clauses, as in the following example:

```
=> SELECT id, emp_name FROM company_a UNION ALL SELECT id, emp_name FROM company_b ORDER BY emp_name LIMIT 2;
id | emp_name
-----+-----
5678 | Alice
8765 | Bob
(2 rows)
```

Each SELECT statement in a UNION clause can specify its own ORDER BY, LIMIT, and OFFSET clauses. Vertica processes the SELECT statement clauses before it processes the UNION clauses. In the following example, Vertica processes the individual queries and then concatenates the two result sets:

```
=> (SELECT id, emp_name FROM company_a ORDER BY emp_name LIMIT 2)
UNION ALL
(SELECT id, emp_name FROM company_b ORDER BY emp_name LIMIT 2);
id | emp_name
-----+-----
5678 | Alice
9012 | Katherine
8765 | Bob
9012 | Katherine
(4 rows)
```

The following requirements and restrictions determine how Vertica processes a UNION clause that contains [ORDER BY](#), [LIMIT](#), and [OFFSET](#) clauses:

- A UNION's ORDER BY clause must specify columns from the first (leftmost) SELECT statement.
- ORDER BY must precede LIMIT and OFFSET.
- When a SELECT or UNION statement specifies both LIMIT and OFFSET, Vertica first processes the OFFSET statement, and then applies the LIMIT statement to the remaining rows.

UNION in non-correlated subqueries

Vertica supports UNION in [noncorrelated subquery predicates](#). For example:

```
=> SELECT DISTINCT customer_key, customer_name FROM public.customer_dimension
WHERE customer_key IN
(SELECT customer_key FROM store.store_sales_fact WHERE sales_dollar_amount > 500
UNION ALL
SELECT customer_key FROM online_sales.online_sales_fact WHERE sales_dollar_amount > 500)
AND customer_state = 'CT';
customer_key | customer_name
-----+-----
7021 | Luigi T. Dobisz
1971 | Betty V. Dobisz
46284 | Ben C. Gauthier
33885 | Tanya Y. Taylor
5449 | Sarah O. Robinson
29059 | Sally Z. Fortin
11200 | Foodhope
15582 | John J. McNulty
24638 | Alexandra F. Jones
...
```

UNION ALL with complex types

You can use UNION ALL with complex types. Consider a table with the following definition:

```
=> CREATE TABLE restaurants(
name VARCHAR, cuisine VARCHAR,
locations ARRAY[ROW(city VARCHAR(50), state VARCHAR(2)),50],
menu ARRAY[ROW(item VARCHAR(50), price FLOAT),100] );
```

Suppose you are in a new city looking for a place to eat. The database has information about the following restaurants:

```
=> SELECT name, cuisine FROM restaurants
WHERE CONTAINS(locations,ROW('Pittsburgh', 'PA'));
```

name	cuisine
Bakersfield Tacos	Mexican
Bob's pizzeria	Italian
Succulent Steaks	American
Sushi House	Asian
Villa Milano	Italian

(5 rows)

Suppose you are hungry for Italian food. If you cannot have Italian, you want something inexpensive. The following query uses two SELECT clauses from the same table, one finding menu items for Italian restaurants and one finding menu items under \$10:

```
=> WITH menu_entries AS
(SELECT name, cuisine,
EXPLODE(menu USING PARAMETERS skip_partitioning=true) AS (idx, menu_entry)
FROM restaurants WHERE CONTAINS(locations,ROW('Pittsburgh', 'PA')))
SELECT name, cuisine, menu_entry FROM menu_entries WHERE cuisine = 'Italian'
UNION ALL
SELECT name, cuisine, menu_entry FROM menu_entries WHERE menu_entry.price <= 10;
```

name	cuisine	menu_entry
Bob's pizzeria	Italian	{"item":"cheese pizza","price":8.25}
Bob's pizzeria	Italian	{"item":"spinach pizza","price":10.5}
Villa Milano	Italian	{"item":"pasta carbonara","price":24.99}
Villa Milano	Italian	{"item":"eggplant parmesan","price":23.49}
Villa Milano	Italian	{"item":"herbed salmon","price":28.99}
Bakersfield Tacos	Mexican	{"item":"veggie taco","price":9.95}
Bob's pizzeria	Italian	{"item":"cheese pizza","price":8.25}

(7 rows)

You cannot use LIMIT OVER with UNION ALL if the selected columns are of complex types. In this case, the statement returns an error like "Multi-value expressions are not supported in this context". You can still use LIMIT OVER in a single SELECT statement by using parentheses to make the scoping explicit.

Examples

The examples that follow use these two tables:

```
=> SELECT * FROM company_a;
ID emp_name dept sales
-----+-----+-----+-----
1234 | Stephen | auto parts | 1000
5678 | Alice | auto parts | 2500
9012 | Katherine | floral | 500
```

```
=> SELECT * FROM company_b;
ID emp_name dept sales
-----+-----+-----+-----
4321 | Marvin | home goods | 250
9012 | Katherine | home goods | 500
8765 | Bob | electronics | 20000
```

The following query finds all employee IDs and names from the two tables. The UNION statement uses DISTINCT to combine unique IDs and last names of employees. Katherine works for both companies, so she appears only once in the result set. DISTINCT is the default and can be omitted:

```
=> SELECT id, emp_name FROM company_a
      UNION DISTINCT SELECT id, emp_name FROM company_b ORDER BY id;
id | emp_name
-----+-----
1234 | Stephen
4321 | Marvin
5678 | Alice
8765 | Bob
9012 | Katherine
(5 rows)
```

If the UNION statement instead uses ALL, the query returns two records for Katherine:

```
=> SELECT id, emp_name FROM company_a
      UNION ALL SELECT id, emp_name FROM company_b ORDER BY id;
id | emp_name
-----+-----
1234 | Stephen
5678 | Alice
9012 | Katherine
4321 | Marvin
9012 | Katherine
8765 | Bob
(6 rows)
```

The following query returns the top two salespeople in each company. Each SELECT statement specifies its own ORDER BY and LIMIT clauses, and the UNION statement concatenates the result sets as returned by each query:

```
=> (SELECT id, emp_name, sales FROM company_a ORDER BY sales DESC LIMIT 2)
      UNION ALL
      (SELECT id, emp_name, sales FROM company_b ORDER BY sales DESC LIMIT 2);
id | emp_name | sales
-----+-----+-----
8765 | Bob      | 20000
5678 | Alice    | 2500
1234 | Stephen  | 1000
9012 | Katherine | 500
(4 rows)
```

The following query returns all employees in both companies with an overall ordering. The ORDER BY clause is part of the UNION statement:

```
=> SELECT id, emp_name, sales FROM company_a
      UNION
      SELECT id, emp_name, sales FROM company_b
      ORDER BY sales;
id | emp_name | sales
-----+-----+-----
4321 | Marvin    | 250
9012 | Katherine | 500
1234 | Stephen  | 1000
5678 | Alice    | 2500
8765 | Bob      | 20000
(5 rows)
```

The following query groups total sales by department within each company. Each SELECT statement has its own GROUP BY clause. UNION combines the aggregate results from each query:

```
=> (SELECT 'Company A' as company, dept, SUM(sales) FROM company_a
    GROUP BY dept)
    UNION
    (SELECT 'Company B' as company, dept, SUM(sales) FROM company_b
    GROUP BY dept)
    ORDER BY 1;
company | dept | sum
-----+-----+-----
Company A | auto parts | 3500
Company A | floral | 500
Company B | electronics | 20000
Company B | home goods | 750
(4 rows)
```

See also

- [SELECT](#)
- [EXCEPT clause](#)
- [INTERSECT clause](#)
- [Subqueries](#)

WHERE clause

Specifies which rows to include in a query's result set.

Syntax

```
WHERE boolean-expression [ subquery ]...
```

Arguments

boolean-expression

An expression that returns true or false. The result set only includes rows that evaluate to true. The expression can include [boolean operators](#) and the following predicate elements:

- [BETWEEN](#)
- [Boolean](#)
- [IN](#)
- [LIKE](#)
- [NULL](#)

Use parentheses to group expressions, predicates, and boolean operators. For example:

```
... WHERE NOT (A=1 AND B=2) OR C=3;
```

Examples

The following example returns the names of all customers in the Eastern region whose name starts with the string **Amer** :

```
=> SELECT DISTINCT customer_name
    FROM customer_dimension
    WHERE customer_region = 'East'
    AND customer_name ILIKE 'Amer%';
customer_name
-----
Americare
Americom
Americore
Americorp
Ameridata
Amerigen
Amerihope
Amerimedia
Amerishop
Ameristar
Ameritech
(11 rows)
```

WITH clause

A WITH clause defines one or more named [common table expressions](#) (CTEs), where each CTE encapsulates a result set that can be referenced by another CTE in the same WITH clause, or by the primary query. Vertica can evaluate WITH clauses in two ways:

- [Inline expansion](#) (default): Vertica evaluates each WITH clause every time it is referenced by the primary query.
- [Materialization](#): Vertica evaluates each WITH clause once, stores results in a temporary table, and references this table as often as the query requires.

In both cases, WITH clauses can help simplify complicated queries and avoid statement repetition.

Syntax

```
WITH [ /*+ENABLE_WITH_CLAUSE_MATERIALIZATION */ ] [ RECURSIVE ] {  
  cte-identifier [ ( column-aliases ) ] AS (  
    [ subordinate-WITH-clause ]  
    query-expression )  
} [...]
```

Arguments

/*+ENABLE_WITH_CLAUSE_MATERIALIZATION*/

Enables materialization of all queries in the current WITH clause. Otherwise, materialization is set by configuration parameter `WithClauseMaterialization`, by default set to 0 (disabled). If `WithClauseMaterialization` is disabled, materialization is automatically cleared when the primary query of the WITH clause returns. For details, see [Materialization of WITH clause](#).

RECURSIVE

Specifies to iterate over the WITH clause's own result set, through repeated execution of an embedded UNION or UNION ALL statement. For details, see [WITH clause recursion](#).

cte-identifier

Identifies a common table expression (CTE) within a WITH clause. This identifier is available to CTEs of the same WITH clause, and of parent and child WITH clauses (if any). CTE identifiers of the outermost (primary) WITH clause are also available to the primary query.

All CTE identifiers of the same WITH clause must be unique. For example, the following WITH clause defines two CTEs, so they require unique identifiers: `regional_sales` and `top_regions` :

```
WITH  
-- query sale amounts for each region  
regional_sales AS (SELECT ... ),  
top_regions AS ( SELECT ... )  
)
```

column-aliases

A comma-delimited list of result set column aliases. The list of aliases must map to all column expressions in the CTE query. If omitted, result set columns can only be referenced by the names used in the query.

In the following example, the `revenue` CTE specifies two column aliases: `vkey` and `total_revenue` . These map to column `vendor_key` and aggregate expression `SUM(total_order_cost)` , respectively. The primary query references these aliases:

```
WITH revenue ( vkey, total_revenue ) AS (  
  SELECT vendor_key, SUM(total_order_cost)  
  FROM store.store_orders_fact  
  GROUP BY vendor_key ORDER BY vendor_key)  
  
SELECT v.vendor_name, v.vendor_address, v.vendor_city, r.total_revenue  
FROM vendor_dimension v JOIN revenue r ON v.vendor_key = r.vkey  
WHERE r.total_revenue = (SELECT MAX(total_revenue) FROM revenue )  
ORDER BY vendor_name;
```

subordinate-WITH-clause

A WITH clause that is nested within the current one. CTEs of this WITH clause can only reference CTEs of the same clause, and of parent and child WITH clauses.

Important

The primary query can only reference CTEs in the outermost WITH clause. It cannot reference the CTEs of any nested WITH clause.

query-expression

The query of a given CTE.

Restrictions

WITH clauses only support SELECT and INSERT statements. They do not support UPDATE or DELETE statements.

Examples

Note

For examples that show usage of recursive WITH clauses, see [WITH clause recursion](#).

Single WITH clause with single CTE

The following SQL defines a WITH clause with one CTE, `revenue`, which aggregates data in table `store.store_orders_fact`. The primary query references the WITH clause result set twice: in its `JOIN` clause and predicate:

```
-- define WITH clause
WITH revenue ( vkey, total_revenue ) AS (
  SELECT vendor_key, SUM(total_order_cost)
  FROM store.store_orders_fact
  GROUP BY vendor_key ORDER BY 1)
-- End WITH clause

-- primary query
SELECT v.vendor_name, v.vendor_address, v.vendor_city, r.total_revenue
FROM vendor_dimension v JOIN revenue r ON v.vendor_key = r.vkey
WHERE r.total_revenue = (SELECT MAX(total_revenue) FROM revenue )
ORDER BY vendor_name;
  vendor_name | vendor_address | vendor_city | total_revenue
-----+-----+-----+-----
Frozen Suppliers | 471 Mission St | Peoria | 49877044
(1 row)
```

Single WITH clause and multiple CTEs

In the following example, the WITH clause contains two CTEs:

- `regional_sales` totals sales for each region
- `top_regions` uses the result set from `regional_sales` to identify the three regions with the highest sales:

The primary query aggregates sales by region and departments in the `top_regions` result set:

```
WITH
-- query sale amounts for each region
regional_sales (region, total_sales) AS (
  SELECT sd.store_region, SUM(of.total_order_cost) AS total_sales
  FROM store.store_dimension sd JOIN store.store_orders_fact of ON sd.store_key = of.store_key
  GROUP BY store_region ),
-- query previous result set
top_regions AS (
  SELECT region, total_sales
  FROM regional_sales ORDER BY total_sales DESC LIMIT 3
)

-- primary query
-- aggregate sales in top_regions result set
SELECT sd.store_region AS region, pd.department_description AS department, SUM(of.total_order_cost) AS product_sales
FROM store.store_orders_fact of
JOIN store.store_dimension sd ON sd.store_key = of.store_key
JOIN public.product_dimension pd ON of.product_key = pd.product_key
WHERE sd.store_region IN (SFI_FCT_region FROM top_regions)
```

```
GROUP BY ROLLUP (region, department) ORDER BY region, product_sales DESC, GROUPING_ID();
```

region	department	product_sales

(43 rows)

INSERT statement that includes WITH clause

The following SQL uses a WITH clause to insert data from a JOIN query into table `total_store_sales` :

```
CREATE TABLE total_store_sales (store_key int, region VARCHAR(20), store_sales numeric (12,2));
```

```
INSERT INTO total_store_sales
```

```
WITH store_sales AS (
```

```
    SELECT sd.store_key, sd.store_region::VARCHAR(20), SUM (of.total_order_cost)
```

```
    FROM store.store_dimension sd JOIN store.store_orders_fact of ON sd.store_key = of.store_key
```

```
    GROUP BY sd.store_region, sd.store_key ORDER BY sd.store_region, sd.store_key)
```

```
SELECT * FROM store_sales;
```

```
=> SELECT * FROM total_store_sales ORDER BY region, store_key;
```

```
store_key | region | store_sales
```

```

In this section

- [Inline expansion of WITH clause](#)
- [Materialization of WITH clause](#)
- [WITH clause recursion](#)

Inline expansion of WITH clause

By default, Vertica uses inline expansion to evaluate WITH clauses. Vertica evaluates each WITH clause every time it is referenced by the primary query. Inline expansion often works best if the query does not reference the same WITH clause multiple times, or if some local optimizations are possible after inline expansion.

Example

The following example shows a WITH clause that is a good candidate for inline expansion. The WITH clause is used in a query that obtains order information for all 2007 orders shipped between December 01-07:

```

-- Begin WITH
WITH store_orders_fact_new AS(
  SELECT * FROM store.store_orders_fact WHERE date_shipped between '2007-12-01' and '2007-12-07')
-- End WITH
-- Begin primary query
SELECT store_key, product_key, product_version, SUM(quantity_ordered*unit_price) AS total_price
FROM store_orders_fact_new
GROUP BY store_key, product_key, product_version
ORDER BY total_price DESC;

```

```
store_key | product_key | product_version | total_price
```

```

-----+-----+-----+-----
232 | 1855 | 2 | 29008
125 | 8500 | 4 | 28812
139 | 3707 | 2 | 28812
212 | 3203 | 1 | 28000
236 | 8023 | 4 | 27548
123 | 10598 | 2 | 27146
34 | 8888 | 4 | 27100
203 | 2243 | 1 | 27027
117 | 13932 | 2 | 27000
84 | 768 | 1 | 26936
123 | 1038 | 1 | 26885
106 | 18932 | 1 | 26864
93 | 10395 | 3 | 26790
162 | 13073 | 1 | 26754
15 | 3679 | 1 | 26675
52 | 5957 | 5 | 26656
190 | 8114 | 3 | 26611
5 | 7772 | 1 | 26588
139 | 6953 | 3 | 26572
202 | 14735 | 1 | 26404
133 | 2740 | 1 | 26312
198 | 8545 | 3 | 26287
221 | 7582 | 2 | 26280
127 | 9468 | 3 | 26224
63 | 8115 | 4 | 25960
171 | 2088 | 1 | 25650
250 | 11210 | 3 | 25608
...

```

Vertica processes the query as follows:

1. Expands the WITH clause reference to `store_orders_fact_new` within the primary query.
2. After expanding the WITH clause, evaluates the primary query.

Materialization of WITH clause

When materialization is enabled, Vertica evaluates each WITH clause once, stores results in a temporary table, and references this table as often as the query requires. Vertica drops the temporary table after primary query execution completes.

Note

If the primary query returns with an error, temporary tables might be dropped only after the client's session ends.

Materialization can facilitate better performance when WITH clauses are complex—for example, when the WITH clauses contain JOIN and GROUP BY clauses, and are referenced multiple times in the primary query.

If materialization is enabled, WITH statements perform an auto-commit of the user transaction. This occurs even when using EXPLAIN with the WITH statement.

Enabling WITH clause materialization

WITH materialization is set by configuration parameter `WithClauseMaterialization`, by default set to 0 (disabled). You can enable and disable materialization by setting `WithClauseMaterialization` at database and session levels, with [ALTER DATABASE](#) and [ALTER SESSION](#), respectively:

- Database:

```
=> ALTER DATABASE db-spec SET PARAMETER WithClauseMaterialization={ 0 | 1 };
=> ALTER DATABASE db-spec CLEAR PARAMETER WithClauseMaterialization;
```

- Session: Parameter setting remains in effect until you explicitly clear it, or the session ends.

```
=> ALTER SESSION SET PARAMETER WithClauseMaterialization={ 0 | 1 };
=> ALTER SESSION CLEAR PARAMETER WithClauseMaterialization;
```

You can also enable WITH materialization for individual queries with the hint [ENABLE_WITH_CLAUSE_MATERIALIZATION](#). Materialization is automatically cleared when the query returns. For example:

```
=> WITH /*+ENABLE_WITH_CLAUSE_MATERIALIZATION */ revenue AS (
  SELECT vendor_key, SUM(total_order_cost) AS total_revenue
  FROM store.store_orders_fact
  GROUP BY vendor_key ORDER BY 1)
...
```

Processing WITH clauses using EE5 temp relations

By default, when WITH clause queries are reused, Vertica saves those WITH clause query outputs in EE5 temp relations. However, this option can be changed. EE5 temp relation support is set by configuration parameter `EnableWITHTempRelReuseLimit`, which can be set in the following ways:

- 0: Disables this feature.
- 1: Force-saves all WITH clause queries into EE5 temp relations, whether or not they are reused.
- 2 (default): Saves only reused WITH clause queries into EE5 temp relations.
- 3 or more: Saves WITH clause queries into EE5 temp relations only when they are used at least this number of times.

`EnableWITHTempRelReuseLimit` can be set at database and session levels, with [ALTER DATABASE](#) and [ALTER SESSION](#), respectively. When `WithClauseMaterialization` is set to 1, that setting overrides any `EnableWITHTempRelReuseLimit` settings.

Note that for WITH queries with complex types, temp relations are disabled.

Example

The following example shows a WITH clause that is a good candidate for materialization. The query obtains data for the vendor who has the highest combined order cost for all orders:

```
-- Enable materialization
=> ALTER SESSION SET PARAMETER WithClauseMaterialization=1;

-- Define WITH clause
=> WITH revenue AS (
  SELECT vendor_key, SUM(total_order_cost) AS total_revenue
  FROM store.store_orders_fact
  GROUP BY vendor_key ORDER BY 1)
-- End WITH clause

-- Primary query
=> SELECT vendor_name, vendor_address, vendor_city, total_revenue
FROM vendor_dimension v, revenue r
WHERE v.vendor_key = r.vendor_key AND total_revenue = (SELECT MAX(total_revenue) FROM revenue )
ORDER BY vendor_name;
 vendor_name | vendor_address | vendor_city | total_revenue
-----+-----+-----+-----
Frozen Suppliers | 471 Mission St | Peoria | 49877044
(1 row)
```

Vertica processes this query as follows:

1. WITH clause `revenue` evaluates its SELECT statement from table `store.store_orders_fact`.
2. Results of the `revenue` clause are stored in a local temporary table.

- Whenever the **revenue** clause statement is referenced, the results stored in the table are used.
- The temporary table is dropped when query execution is complete.

WITH clause recursion

A WITH clause that includes the RECURSIVE option iterates over its own output through repeated execution of a UNION or UNION ALL query. Recursive queries are useful when working with self-referential data—hierarchies such as manager-subordinate relationships, or tree-structured data such as taxonomies.

The configuration parameter [WithClauseRecursionLimit](#)—by default set to 8—sets the maximum depth of recursion. You can set this parameter at database and session scopes with ALTER DATABASE and ALTER SESSION, respectively. Recursion continues until it reaches the configured maximum depth, or until the last iteration returns with no data.

You specify a recursive WITH clause as follows:

```
WITH [ /*+ENABLE_WITH_CLAUSE_MATERIALIZATION*/ ] RECURSIVE
  cte-identifier [ ( column-aliases ) ] AS (
    non-recursive-term
    UNION [ ALL ]
    recursive-term
  )
```

Non-recursive and recursive terms are separated by UNION or UNION ALL:

- The **non-recursive-term** query sets its result set in **cte-identifier**, which is subject to recursion in **recursive-term**.
- The UNION statement's **recursive-term** recursively iterates over its own output. When recursion is complete, the results of all iterations are compiled and set in **cte-identifier**.

For example:

```
=> ALTER SESSION SET PARAMETER WithClauseRecursionLimit=4; -- maximum recursion depth = 4
=> WITH RECURSIVE nums (n) AS (
  SELECT 1 -- non-recursive (base) term
  UNION ALL
  SELECT n+1 FROM nums -- recursive term
)
SELECT n FROM nums; -- primary query
```

This simple query executes as follows:

- Executes the WITH RECURSIVE clause:
 - Evaluates the non-recursive term **SELECT 1**, and places the result set—1—in **nums**.
 - Iterates over the UNION ALL query (**SELECT n+1**) until the number of iterations is greater than the configuration parameter **WithClauseRecursionLimit**.
 - Combines the results of all UNION queries and sets the result set in **nums**, and then exits to the primary query.
- Executes the primary query **SELECT n FROM nums**:

```
n
---
1
2
3
4
5
(5 rows)
```

In this case, WITH RECURSIVE clause exits after four iterations as per **WithClauseRecursionLimit**. If you restore **WithClauseRecursionLimit** to its default value of 8, then the clause exits after eight iterations:

```
=> ALTER SESSION CLEAR PARAMETER WithClauseRecursionLimit;
=> WITH RECURSIVE nums (n) AS (
  SELECT 1
  UNION ALL
  SELECT n+1 FROM nums
)
SELECT n FROM nums;
n
---
1
2
3
4
5
6
7
8
9
(9 rows)
```

Important

Be careful to set `WithClauseRecursionLimit` only as high as needed to traverse the deepest hierarchies. Vertica sets no limit on this parameter; however, a high value can incur considerable overhead that adversely affects performance and exhausts system resources.

If a high recursion count is required, then consider enabling materialization. For details, see [WITH RECURSIVE Materialization](#).

Restrictions

The following restrictions apply:

- The `SELECT` list of a non-recursive term cannot include the wildcard `*` (asterisk) or the function [MATCH_COLUMNS](#).
- A recursive term can reference the target CTE only once.
- Recursive reference cannot appear within an outer join.
- Recursive reference cannot appear within a subquery.
- `WITH` clauses do not support `UNION` options `ORDER BY`, `LIMIT`, and `OFFSET`.

Examples

A small software company maintains the following data on employees and their managers:

```
=> SELECT * FROM personnel.employees ORDER BY emp_id;
emp_id | fname | lname | section_id | section_name | section_leader | leader_id
-----+-----+-----+-----+-----+-----+-----
 0 | Stephen | Mulligan | 0 | | | 
 1 | Michael | North | 201 | Development | Zoe Black | 3
 2 | Megan | Berry | 202 | QA | Richard Chan | 18
 3 | Zoe | Black | 101 | Product Development | Renuka Patil | 24
 4 | Tim | James | 203 | IT | Ebuka Udechukwu | 17
 5 | Bella | Tucker | 201 | Development | Zoe Black | 3
 6 | Alexandra | Climo | 202 | QA | Richard Chan | 18
 7 | Leonard | Gray | 203 | IT | Ebuka Udechukwu | 17
 8 | Carolyn | Henderson | 201 | Development | Zoe Black | 3
 9 | Ryan | Henderson | 201 | Development | Zoe Black | 3
10 | Frank | Tucker | 205 | Sales | Benjamin Glover | 29
11 | Nathan | Ferguson | 102 | Sales Marketing | Eric Redfield | 28
12 | Kevin | Rampling | 101 | Product Development | Renuka Patil | 24
13 | Tuy Kim | Duong | 201 | Development | Zoe Black | 3
14 | Dwipendra | Sing | 204 | Tech Support | Sarah Feldman | 26
15 | Dylan | Wijman | 206 | Documentation | Kevin Rampling | 12
16 | Tamar | Sasson | 207 | Marketing | Nathan Ferguson | 11
17 | Ebuka | Udechukwu | 101 | Product Development | Renuka Patil | 24
18 | Richard | Chan | 101 | Product Development | Renuka Patil | 24
19 | Maria | del Rio | 201 | Development | Zoe Black | 3
20 | Hua | Song | 204 | Tech Support | Sarah Feldman | 26
21 | Carmen | Lopez | 204 | Tech Support | Sarah Feldman | 26
22 | Edgar | Mejia | 206 | Documentation | Kevin Rampling | 12
23 | Riad | Salim | 201 | Development | Zoe Black | 3
24 | Renuka | Patil | 100 | Executive Office | Stephen Mulligan | 0
25 | Rina | Dsouza | 202 | QA | Richard Chan | 18
26 | Sarah | Feldman | 101 | Product Development | Renuka Patil | 24
27 | Max | Mills | 102 | Sales Marketing | Eric Redfield | 28
28 | Eric | Redfield | 100 | Executive Office | Stephen Mulligan | 0
29 | Benjamin | Glover | 102 | Sales Marketing | Eric Redfield | 28
30 | Dominic | King | 205 | Sales | Benjamin Glover | 29
32 | Ryan | Metcalfe | 206 | Documentation | Kevin Rampling | 12
33 | Piers | Paige | 201 | Development | Zoe Black | 3
34 | Nicola | Kelly | 207 | Marketing | Nathan Ferguson | 11
(34 rows)
```

You can query this data for employee-manager relationships through WITH RECURSIVE. For example, the following query's WITH RECURSIVE clause gets employee-manager relationships for employee Eric Redfield, including all employees who report directly and indirectly to him:

```
WITH RECURSIVE managers (employeeID, employeeName, sectionID, section, lead, leadID)
AS (SELECT emp_id, fname||' '||lname, section_id, section_name, section_leader, leader_id
     FROM personnel.employees WHERE fname||' '||lname = 'Eric Redfield'
UNION
     SELECT emp_id, fname||' '||lname AS employee_name, section_id, section_name, section_leader, leader_id FROM personnel.employees e
     JOIN managers m ON m.employeeID = e.lead_id)
SELECT employeeID, employeeName, lead AS 'Reports to', section, leadID from managers ORDER BY sectionID, employeeName;
```

The WITH RECURSIVE clause defines the CTE `managers`, and then executes in two phases:

1. The non-recursive term populates `managers` with data that it queries from `personnel.employees`.
2. The recursive term's UNION query iterates over its own output until, on the fourth cycle, it finds no more data. The results of all iterations are then compiled and set in `managers`, and the WITH CLAUSE exits to the primary query.

The primary query returns three levels of data from `managers`—one for each recursive iteration:

employeeID	employeeName	Reports to	section	leadID	
28	Eric Redfield	Stephen Mulligan	Executive Office	0	Level 0
29	Benjamin Glover	Eric Redfield	Sales Marketing	28	Level 1
27	Max Mills	Eric Redfield	Sales Marketing	28	
11	Nathan Ferguson	Eric Redfield	Sales Marketing	28	Level 2
30	Dominic King	Benjamin Glover	Sales	29	
10	Frank Tucker	Benjamin Glover	Sales	29	
34	Nicola Kelly	Nathan Ferguson	Marketing	11	
16	Tamar Sasson	Nathan Ferguson	Marketing	11	

(8 rows)

Similarly, the following query iterates over the same data to get all employee-manager relationships for employee Richard Chan, who is one level lower in the company chain of command:

```
WITH RECURSIVE managers (employeeID, employeeName, sectionID, section, lead, leadID)
AS (SELECT emp_id, fname||' '||lname, section_id, section_name, section_leader, leader_id
FROM personnel.employees WHERE fname||' '||lname = 'Richard Chan'
UNION
SELECT emp_id, fname||' '||lname AS employee_name, section_id, section_name, section_leader, leader_id FROM personnel.employees e
JOIN managers m ON m.employeeID = e.lead_id)
SELECT employeeID, employeeName, lead AS 'Reports to', section, leadID from managers ORDER BY sectionID, employeeName;
```

The WITH RECURSIVE clause executes as before, except this time it finds no more data after two iterations and exits. Accordingly, the primary query returns two levels of data from **managers** :

employeeID	employeeName	Reports to	section	leadID	
18	Richard Chan	Renuka Patil	Product Development	24	Level 0
6	Alexandra Climo	Richard Chan	QA	18	Level 1
2	Megan Berry	Richard Chan	QA	18	
25	Rina Dsouza	Richard Chan	QA	18	

(4 rows)

WITH RECURSIVE materialization

By default, materialization is disabled. In this case, Vertica rewrites the WITH RECURSIVE query into subqueries, as many as necessary for the required level of recursion.

If recursion is very deep, the high number of query rewrites is liable to incur considerable overhead that adversely affects performance and exhausts system resources. In this case, consider enabling materialization, either with the configuration parameter [WithClauseMaterialization](#), or the hint [ENABLE WITH CLAUSE MATERIALIZATION](#). In either case, intermediate result sets from all recursion levels are written to local temporary tables. When recursion is complete, the intermediate results in all temporary tables are compiled and passed on to the primary query.

Note
If materialization is not possible, you can improve throughput on a resource pool that handles recursive queries by setting its [EXECUTIONPARALLELISM](#) parameter to 1.

SET statements

SET statements let you change how the database operates, such as changing the autocommit settings or the resource pool your session uses.

In this section

- [SET DATESTYLE](#)
- [SET ESCAPE_STRING_WARNING](#)
- [SET INTERVALSTYLE](#)
- [SET LOCALE](#)
- [SET ROLE](#)
- [SET SEARCH_PATH](#)
- [SET SESSION AUTHORIZATION](#)
- [SET SESSION AUTOCOMMIT](#)
- [SET SESSION CHARACTERISTICS AS TRANSACTION](#)
- [SET SESSION GRACEPERIOD](#)
- [SET SESSION IDLESESSIONTIMEOUT](#)
- [SET SESSION MEMORYCAP](#)
- [SET SESSION MULTIPLEACTIVERESULTSETS](#)
- [SET SESSION RESOURCE_POOL](#)
- [SET SESSION RUNTIMECAP](#)
- [SET SESSION TEMPSPACECAP](#)
- [SET SESSION WORKLOAD](#)

- [SET STANDARD_CONFORMING_STRINGS](#)
- [SET TIME_ZONE](#)

SET DATESTYLE

Specifies how to format date/time output for the current session. Use [SHOW DATESTYLE](#) to verify the current output settings.

Syntax

```
SET DATESTYLE TO { arg | 'arg' }[, arg | 'arg']
```

Parameters

SET DATESTYLE has a single parameter, which can be set to one or two arguments that specify date ordering and style. Each argument can be specified singly or in combination with the other; if combined, they can be specified in any order.

The following table describes each style and the date ordering arguments it supports:

Date style arguments	Order arguments	Example
ISO (ISO 8601/SQL standard)	n/a	2016-03-16 00:00:00
GERMAN	n/a	16.03.2016 00:00:00
SQL	MDY	03/16/2016 00:00:00
	DMY (default)	16/03/2016 00:00:00
POSTGRES	MDY (default)	Wed Mar 16 00:00:00 2016
	DMY	Wed 16 Mar 00:00:00 2016

Vertica ignores the order argument for date styles **ISO** and **GERMAN**. If the date style is **SQL** or **POSTGRES**, the order setting determines whether dates are output in **MDY** or **DMY** order. Neither **SQL** nor **POSTGRES** support **YMD** order. If you specify **YMD** for **SQL** or **POSTGRES**, Vertica ignores it and uses their default **MDY** order.

Date styles and ordering can also affect how Vertica interprets input values. For more information, see [Date/time literals](#).

Privileges

None

Input dependencies

In some cases, input format can determine output, regardless of date style and order settings:

- Vertica ISO output for **DATESTYLE** is ISO long form, but several input styles are accepted. If the year appears first in the input, **YMD** is used for input and output, regardless of the **DATESTYLE** value.
- **INTERVAL** input and output share the same format, with the following exceptions:
 - Units like **CENTURY** or **WEEK** are converted to years and days.
 - **AGO** is converted to the appropriate sign.

If the date style is set to ISO, output follows this format:

```
[ quantity unit [...] ] [ days ] [ hours:minutes:seconds ]
```

Examples

```
=> CREATE TABLE t(a DATETIME);
CREATE TABLE
=> INSERT INTO t values ('3/16/2016');
OUTPUT
```

```
-----
1
(1 row)
```

```
=> SHOW DATESTYLE;
name | setting
```

```
-----+-----
datestyle | ISO, MDY
(1 row)
```

```
=> SELECT * FROM t;
a
```

```
-----
2016-03-16 00:00:00
(1 row)
```

```
=> SET DATESTYLE TO German;
SET
```

```
=> SHOW DATESTYLE;
name | setting
```

```
-----+-----
datestyle | German, DMY
(1 row)
```

```
=> SELECT * FROM t;
a
```

```
-----
16.03.2016 00:00:00
(1 row)
```

```
=> SET DATESTYLE TO SQL;
SET
```

```
=> SHOW DATESTYLE;
name | setting
```

```
-----+-----
datestyle | SQL, DMY
(1 row)
```

```
=> SELECT * FROM t;
a
```

```
-----
16/03/2016 00:00:00
(1 row)
```

```
=> SET DATESTYLE TO Postgres, MDY;
SET
```

```
=> SHOW DATESTYLE;
name | setting
```

```
-----+-----
datestyle | Postgres, MDY
(1 row)
```

```
=> SELECT * FROM t;
a
```

```
-----
Wed Mar 16 00:00:00 2016
(1 row)
```

SET ESCAPE_STRING_WARNING

Issues a warning when a backslash is used in a string literal during the current [session](#).

Syntax

```
SET ESCAPE_STRING_WARNING TO { ON | OFF }
```

Parameters

ON

[Default] Issues a warning when a back slash is used in a string literal.

Tip: Organizations that have upgraded from earlier versions of Vertica can use this as a debugging tool for locating backslashes that used to be treated as escape characters, but are now treated as literals.

OFF

Ignores back slashes within string literals.

Privileges

None

Notes

- This statement works under vsql only.
- Turn off standard conforming strings before you turn on this parameter.

Tip

To set escape string warnings across all sessions, use the `EscapeStringWarnings` configuration parameter. See the [Internationalization parameters](#).

Examples

The following example shows how to turn OFF escape string warnings for the session.

```
=> SET ESCAPE_STRING_WARNING TO OFF;
```

See also

- [SET STANDARD_CONFORMING_STRINGS](#)

SET INTERVALSTYLE

Specifies whether to include units in interval output for the current [session](#).

Syntax

```
SET INTERVALSTYLE TO [ plain | units ]
```

Parameters

plain

(default) Sets the default interval output to omit units.

units

Enables interval output to include [subtype unit identifiers](#). When `INTERVALSTYLE` is set to `units`, the `DATESTYLE` parameter controls output. If you enable units and they do not display in the output, check the `DATESTYLE` parameter value, which must be set to `ISO` or `POSTGRES` for interval units to display.

Privileges

None

Examples

See [Setting interval unit display](#).

SET LOCALE

Specifies locale for the current [session](#).

You can also set the current locale with the vsql command [locale](#).

Syntax

```
SET LOCALE TO ICU-locale-identifier
```

Parameters

locale-identifier

Specifies the ICU locale identifier to use, by default set to:

```
en_US@collation=binary
```

If set to an empty string, Vertica sets locale to **en_US_POSIX** .

The following requirements apply:

- Vertica only supports the **COLLATION** keyword.
- Single quotes are mandatory to specify collation.

Privileges

None

Commonly used locales

For details on identifier options, see [About locale](#) . For a complete list of locale identifiers, see the [ICU Project](#) .

de_DE

German (Germany)

en_GB

English (Great Britain)

es_ES

Spanish (Spain)

fr_FR

French (France)

pt_BR

Portuguese (Brazil)

pt_PT

Portuguese (Portugal)

ru_RU

Russian (Russia)

ja_JP

Japanese (Japan)

zh_CN

Chinese (China, simplified Han)

zh_Hant_TW

Chinese (Taiwan, traditional Han)

Examples

Set session locale to **en_GB** :

```
=> SET LOCALE TO en_GB;  
INFO 2567: Canonical locale: 'en_GB'  
Standard collation: 'LEN'  
English (United Kingdom)  
SET
```

Use the short form of a locale:

```
=> SET LOCALE TO LEN;  
INFO 2567: Canonical locale: 'en'  
Standard collation: 'LEN'  
English  
SET
```

Specify collation:

```
=> SET LOCALE TO 'tr_tr@collation=standard';
INFO 2567: Canonical locale: 'tr_TR@collation=standard'
Standard collation: 'LTR'
Turkish (Turkey, collation=standard) Türkçe (Türkiye, Sıralama=standard)
SET
```

See also

- [Implement locales for international data sets](#)
- [About locale](#)

SET ROLE

Enables a role for the user's current session. The user can access privileges that have been granted to the role. Enabling a role has no effect on roles that are currently enabled.

Tip

Use [SHOW AVAILABLE ROLES](#) to list granted roles.

Syntax

```
SET ROLE roles-expression
```

Parameters

roles-expression

Specifies what roles are the default roles for this user, with one of the following expressions:

- **NONE** (default): Disables all roles.
- **roles-list**: A comma-delimited list of roles to enable. You can only set roles that are currently granted to you.
- **ALL [EXCEPT roles-list]**: Enables all roles currently granted to this user, excluding any comma-delimited roles specified in the optional **EXCEPT** clause.
- **DEFAULT**: Enables all [default roles](#). Default roles are, by definition, enabled automatically, but this option might be useful for re-enabling them if they are disabled with SET ROLE NONE.

Privileges

None

Examples

This example shows the following:

- SHOW AVAILABLE_ROLES; lists the roles available to the user, but not enabled.
- SET ROLE applogs; enables the applogs role for the user.
- SHOW ENABLED_ROLES; lists the applogs role as enabled (SET) for the user.
- SET ROLE appuser; enables the appuser role for the user.
- SHOW ENABLED_ROLES now lists both applogs and appuser as enabled roles for the user.
- SET ROLE NONE disables all the users' enabled roles.
- SHOW ENABLED_ROLES shows that no roles are enabled for the user.

```

=> SHOW AVAILABLE_ROLES;
  name  |  setting
-----+-----
available roles | applogs, appadmin, appuser
(1 row)

=> SET ROLE applogs;
SET
=> SHOW ENABLED_ROLES;
  name  |  setting
-----+-----
enabled roles | applogs
(1 row)

=> SET ROLE appuser;
SET
=> SHOW ENABLED_ROLES;
  name  |  setting
-----+-----
enabled roles | applogs, appuser
(1 row)

=> SET ROLE NONE;
SET

=> SHOW ENABLED_ROLES;
  name  |  setting
-----+-----
enabled roles |
(1 row)

```

Set User Default Roles

Though the DBADMIN user is normally responsible for setting a user's default roles, as a user you can set your own role. For example, if you run SET ROLE NONE all of your enabled roles are disabled. Then it was determined you need access to role1 as a default role. The DBADMIN uses [ALTER USER](#) to assign you a default role:

```

=> ALTER USER user1 default role role1;

```

This example sets role1 as user1's default role because the DBADMIN assigned this default role using ALTER USER.

```

user1 => SET ROLE default;
user1 => SHOW ENABLED_ROLES;
  name  |  setting
-----+-----
enabled roles | role1
(1 row)

```

Set All Roles as Default

This example makes all roles granted to user1 default roles:

```

user1 => SET ROLE all;
user1 => show enabled roles;
  name  |  setting
-----+-----
enabled roles | role1, role2, role3
(1 row)

```

Set All Roles as Default With EXCEPT

This example makes all the roles granted to the user default roles with the exception of role1.

```
user1 => set role all except role1;
user1 => SHOW ENABLED_ROLES
  name | setting
-----+-----
enabled roles | role2, role3
(1 row)
```

SET SEARCH_PATH

Specifies the order in which Vertica searches schemas when a SQL statement specifies a table name that is unqualified by a schema name. **SET SEARCH_PATH** overrides the current session's search path, which is initially set from the user profile. This search path remains in effect until the next **SET SEARCH_PATH** statement, or the session ends. For details, see [Setting search paths](#).

To view the current search path, use [SHOW SEARCH_PATH](#).

Syntax

```
SET SEARCH_PATH { TO | = } { schema-list | DEFAULT }
```

Parameters

schema-list

A comma-delimited list of schemas that indicates the order in which Vertica searches schemas for a table whose name is unqualified by a schema name.

If the search path includes a schema that does not exist, or for which the user lacks access privileges, Vertica silently skips over that schema.

DEFAULT

Sets the search path to the database default:

```
"$user", public, v_catalog, v_monitor, v_internal
```

Privileges

None

Examples

Show the current search path:

```
=> SHOW SEARCH_PATH;
  name |          setting
-----+-----
search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```

Reset the search path to schemas **store** and **public** :

```
=> SET SEARCH_PATH TO store, public;
=> SHOW SEARCH_PATH;
  name |          setting
-----+-----
search_path | store, public, v_catalog, v_monitor, v_internal
(1 row)
```

Reset the search path to the database default settings:

```
=> SET SEARCH_PATH TO DEFAULT;
SET
=> SHOW SEARCH_PATH;
  name |          setting
-----+-----
search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```

SET SESSION AUTHORIZATION

Sets the current and session user for the current database connection. You can change session authorization to execute queries as another user for testing or debugging purposes, or to limit query access.

Syntax

```
SET SESSION AUTHORIZATION { username | DEFAULT }
```

Parameters

username

The name of the user that you want to authorize for the current SQL session.

DEFAULT

Sets session authorization to the [dbadmin](#) user.

Privileges

Superuser

Examples

In the following example, the [dbadmin](#) gives the [debuguser](#) user session authorization, and then changes the session authorization back to the [dbadmin](#) user.

1. Verify the current user and session user:

```
=> SELECT CURRENT_USER(), SESSION_USER();
current_user | session_user
-----+-----
dbadmin      | dbadmin
(1 row)
```

2. Set authorization for the current session to [debuguser](#) , and verify the changes:

```
=> SET SESSION AUTHORIZATION debuguser;
SET
=> SELECT CURRENT_USER(), SESSION_USER();
current_user | session_user
-----+-----
debuguser    | debuguser
(1 row)
```

3. After you complete debugging tasks, set the session authorization to [DEFAULT](#) to set the current and session user back to [dbadmin](#) user, and verify the changes:

```
=> SET SESSION AUTHORIZATION DEFAULT;
SET
=> SELECT CURRENT_USER(), SESSION_USER();
current_user | session_user
-----+-----
dbadmin      | dbadmin
(1 row)
```

SET SESSION AUTOCOMMIT

Sets whether statements automatically commit their transactions on completion. This statement is primarily used by the client drivers to enable and disable autocommit, you should never have to directly call it.

Syntax

```
SET SESSION AUTOCOMMIT TO { ON | OFF }
```

Parameters

ON

Enable autocommit. Statements automatically commit their transactions when they complete. This is the default setting for connections made using the Vertica client libraries.

OFF

Disable autocommit. Transactions are not automatically committed. This is the default for interactive sessions (connections made through [vsq](#)l).

Privileges

None

Examples

This examples show how to set AUTOCOMMIT to 'on' and then to 'off'.

```
=> SET SESSION AUTOCOMMIT TO on;  
SET  
=> SET SESSION AUTOCOMMIT TO off;  
SET
```

See also

- [Client libraries](#)

SET SESSION CHARACTERISTICS AS TRANSACTION

Sets the isolation level and access mode of all transactions that start after this statement is issued.

A transaction retains its isolation level until it completes, even if the session's isolation level changes during the transaction. Vertica internal processes (such as the [Tuple Mover](#) and [refresh](#) operations) and DDL operations always run at the SERIALIZABLE isolation level to ensure consistency.

Syntax

```
SET SESSION CHARACTERISTICS AS TRANSACTION settings
```

settings

One or both of the following:

-

ISOLATION LEVEL *argument*

- [READ ONLY | READ WRITE](#)

ISOLATION LEVEL arguments

The ISOLATION LEVEL clause determines what data the transaction can access when other transactions run concurrently. You cannot change the isolation level after the first query (SELECT) or DML statement (INSERT, DELETE, UPDATE) if a transaction has run.

Set ISOLATION LEVEL to one of the following arguments:

SERIALIZABLE

Sets the strictest level of SQL transaction isolation. This level emulates transactions serially, rather than concurrently. It holds locks and blocks write operations until the transaction completes.

Applications that use **SERIALIZABLE** must be prepared to retry transactions in the event of serialization failures. This isolation level is not recommended for normal query operations.

Setting the transaction isolation level to **SERIALIZABLE** does not apply to temporary tables. Temporary tables are isolated by their transaction scope.

REPEATABLE READ

Automatically converted to **SERIALIZABLE** .

READ COMMITTED

Default, allows concurrent transactions.

READ UNCOMMITTED

Automatically converted to **READ COMMITTED** .

READ WRITE/READ ONLY

You can set the transaction access mode with one of the following:

READ WRITE

Default, allows read/write access to SQL statements.

READ ONLY

Disallows SQL statements that require write access:

- INSERT, UPDATE, DELETE, and COPY operations on any non-temporary table.
- CREATE, ALTER, and DROP
- GRANT, REVOKE
- EXPLAIN if the SQL statement to explain requires write access.

Note

Setting the transaction session mode to read-only does not prevent all write operations.

Privileges

None

Viewing session transaction characteristics

[SHOW TRANSACTION_ISOLATION](#) and [SHOW TRANSACTION_READ_ONLY](#) show the transaction settings for the current session:

```
=> SHOW TRANSACTION_ISOLATION;
```

```
  name      | setting
-----+-----
transaction_isolation | SERIALIZABLE
(1 row)
```

```
=> SHOW TRANSACTION_READ_ONLY;
```

```
  name      | setting
-----+-----
transaction_read_only | true
(1 row)
```

SET SESSION GRACEPERIOD

Sets how long a session socket remains blocked while awaiting client input or output for a given query. If the socket is blocked for a continuous period that exceeds the grace period setting, the server shuts down the socket and throws a fatal error. The session is then terminated. If no grace period is set, the query can maintain its block on the socket indefinitely.

Vertica applies a session's grace period and [RUNTIMECAP](#) settings independently. If no grace period is set, a query can continue to block indefinitely on a session socket, regardless of the query's [RUNTIMECAP](#) setting.

Syntax

```
SET SESSION GRACEPERIOD duration
```

Parameters

duration

Specifies how long a query can block on any session socket, one of the following:

- `'interval'` : Specifies as an [interval](#) the maximum grace period for current session queries, up to 20 days.
- `=DEFAULT` : Sets the grace period for queries in this session to the user's [GRACEPERIOD](#) value. A new session is initially set to this value.
- `NONE` : Valid only for superusers, removes any grace period previously set on session queries.

Privileges

- [Superusers](#) can increase session grace period to any value, regardless of database or node settings.
- Non-superusers can only set the session grace period to a value equal to or lower than their own user setting. If no grace period is explicitly set for a user, the grace period for that user is inherited from the node or database settings.

Examples

See [Handling session socket blocking](#) in the Administrator's Guide.

SET SESSION IDLESESSIONTIMEOUT

Sets the maximum amount of time that a session can remain idle before it exits.

Note

An idle session has no queries running.

Syntax

```
SET SESSION IDLESESSIONTIMEOUT duration
```

Parameters

duration

Specifies the amount of time a session can remain idle before it exits:

- **NONE** (default): No idle timeout set on the session.
- **'interval'**: Specifies as an [interval](#) the maximum amount of time a session can remain idle.
- **=DEFAULT**: Sets the idle timeout period for this session to the user's **IDLESESSIONTIMEOUT** value.

Privileges

- [Superusers](#) can increase the time a session can remain idle to any value, regardless of database or node settings.
- Non-superusers can only set the session idle time to a value equal to or lower than their own user setting. If no session idle time is explicitly set for a user, the session idle time for that user is inherited from the node or database settings.

Examples

See [Managing client connections](#) in the Administrator's Guide.

SET SESSION MEMORYCAP

Limits how much memory can be allocated to any request in the current [session](#). This limit only applies to the current session; it does not limit the total amount of memory used by multiple sessions.

Syntax

```
SET SESSION MEMORYCAP limit
```

Parameters

limit

One of the following:

- **'max-expression'**: A string value that specifies the memory limit, one of the following:
 - **int %** — Expresses the maximum as a percentage of total memory available to the [Resource manager](#), where **int** is an integer value between 0 and 100. For example:
MEMORYCAP '40%'
 - **int {K|M|G|T}** — Expresses memory allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:
MEMORYCAP '10G'
- **=DEFAULT**: Sets the memory cap for queries in this session to the user's **MEMORYCAP** value. A new session is initially set to this value.
- **NONE**: Removes the memory cap for this session.

Privileges

- [Superusers](#) can increase session memory cap to any value.
- Non-superusers can only set the session memory cap to a value equal to or lower than their own user setting.

Examples

Set the session memory cap to 2 gigabytes:

```
=> SET SESSION MEMORYCAP '2G';
SET
=> SHOW MEMORYCAP;
  name | setting
-----+-----
memorycap | 2097152
(1 row)
```

Revert the memory cap to the default setting as specified in the user profile:

```
=> SET MEMORYCAP=DEFAULT;
SET
=> SHOW MEMORYCAP;
  name | setting
-----+-----
memorycap | 2013336
(1 row)
```

[Managing workloads](#)

SET SESSION MULTIPLEACTIVERESULTSETS

Enables or disable the execution of multiple active result sets (MARS) on a single JDBC connection. Using this option requires an active JDBC connection.

Syntax

```
SET SESSION MULTIPLEACTIVERESULTSETS TO { ON | OFF }
```

Parameters

ON

Enable MultipleActiveResultSets. Allows you to execute multiple result sets on a single connection.

OFF

Disable MultipleActiveResultSets. Allows only one active result set per connection. (Default value.)

Privileges

None

Examples

This example shows how you can set MultipleActiveResultSets to on and then to off:

```
=> SET SESSION MULTIPLEACTIVERESULTSETS TO on;
SET
=> SET SESSION MULTIPLEACTIVERESULTSETS TO off;
SET
```

SET SESSION RESOURCE_POOL

Associates the user [session](#) with the specified resource pool.

Syntax

```
SET SESSION RESOURCE_POOL = { pool-name | DEFAULT }
```

Parameters

pool-name

The name of an existing resource pool to associate with the current session. Non-superusers must have USAGE privileges on the specified resource pool.

DEFAULT

Sets the session's resource pool to the resource pool [assigned to this user](#).

Privileges

None

Examples

This example sets **ceo_pool** as the session resource pool:

```
=> SET SESSION RESOURCE_POOL = ceo_pool;
SET
```

See also

- [ALTER RESOURCE POOL](#)
- [CREATE RESOURCE POOL](#)
- [CREATE USER](#)
- [DROP RESOURCE POOL](#)
- [GRANT \(Resource pool\)](#)
- [SET SESSION MEMORYCAP](#)
- [Managing workloads](#)

SET SESSION RUNTIMECAP

Sets the maximum amount of time queries and [stored procedures](#) can run in a given session. If a query or stored procedure exceeds its session's **RUNTIMECAP**, Vertica terminates it and returns an error. You cannot increase the **RUNTIMECAP** beyond the limit that is set in your [user profile](#).

Note

Vertica does not strictly enforce session `RUNTIMECAP` settings. If you time a query or stored procedure, you might discover that it runs longer than the `RUNTIMECAP` setting.

Syntax

```
SET SESSION RUNTIMECAP duration
```

Parameters

duration

Specifies how long a given query can run in the current session, one of the following:

- `NONE` (default): Removes a runtime limit for all current session queries.
- `'interval'`: Specifies as an [interval](#) the maximum runtime for current session queries, up to one year—for example, `1 minute` or `100 seconds`.
- `=DEFAULT`: Sets maximum runtime for queries in this session to the user's `RUNTIMECAP` value.

Privileges

- [Superusers](#) can increase session `RUNTIMECAP` to any value.
- Non-superusers can only set the session `RUNTIMECAP` to a value equal to or lower than their own user `RUNTIMECAP`.

Examples

Set the maximum query runtime for the current session to 10 minutes:

```
=> SET SESSION RUNTIMECAP '10 minutes';
```

Revert the session `RUNTIMECAP` to your user default setting:

```
=> SET SESSION RUNTIMECAP =DEFAULT;
```

```
SET
```

```
=> SHOW RUNTIMECAP;
```

```
  name | setting
-----+-----
runtimecap | UNLIMITED
(1 row)
```

Set the `RUNTIMECAP` to `1 SECOND` and run an [anonymous procedure](#) with an [infinite loop](#):

```
=> SET SESSION RUNTIMECAP '1 SECOND';
```

```
SET
```

```
=> DO $$
```

```
BEGIN
```

```
  LOOP
```

```
  END LOOP;
```

```
END;
```

```
$$;
```

```
ERROR 0: Query exceeded maximum runtime
```

```
HINT: Change the maximum runtime using SET SESSION RUNTIMECAP
```

See also

- [Setting a runtime limit for queries](#)
- [Managing workloads](#)

SET SESSION TEMPSPACECAP

Sets the maximum amount of temporary file storage that any request issued by the [session](#) can consume. If a query's execution plan requires more storage space than the session `TEMPSPACECAP`, it returns an error.

Syntax

```
SET SESSION TEMPSPACECAP limit
```

Arguments

limit

The maximum amount of temporary file storage to allocate to the current session, one of the following:

- **NONE** (default): Unlimited temporary storage
- **= DEFAULT** : Session TEMPSPACECAP is set to the user's [TEMPSPACECAP](#) value.
- String that specifies the storage limit, one of the following:

- *int*% expresses the maximum as a percentage of total temporary storage available to the Resource Manager, where *int* is an integer value between 0 and 100. For example:

```
SET SESSION TEMPSPACECAP '40%';
```

- *int* {**K**|**M**|**G**|**T**} expresses storage allocation in kilobytes, megabytes, gigabytes, or terabytes. For example:

```
SET SESSION TEMPSPACECAP '10G';
```

Privileges

Non-superusers:

- Restricted to setting only their own sessions
- Session TEMPSPACECAP cannot be greater than their own [TEMPSPACECAP](#).

Examples

Set the session TEMPSPACECAP to 20 gigabytes:

```
=> SET SESSION TEMPSPACECAP '20G';
SET
=> SHOW TEMPSPACECAP;
  name | setting
-----+-----
tempSPACECAP | 20971520
(1 row)
```

Note

SHOW displays the TEMPSPACECAP in kilobytes.

Set the session TEMPSPACECAP to unlimited:

```
=> SET SESSION TEMPSPACECAP NONE;
SET
=> SHOW TEMPSPACECAP;
  name | setting
-----+-----
tempSPACECAP | UNLIMITED
(1 row)
```

See also

- [ALTER USER](#)
- [CREATE USER](#)
- [Managing workloads](#)

SET SESSION WORKLOAD

Sets the [workload](#) for the current session.

For details on this and other session parameters, see [SHOW](#):

Syntax

```
SET SESSION WORKLOAD TO { workload_name | DEFAULT | NONE }
```

Parameters

workload_name

The workload to use for the current session. The specified workload must be associated with a [workload routing rule](#).

DEFAULT

Sets the workload to the workload [granted](#) to the [current user or their roles](#). If they have more than one workload, the one with the [highest priority](#) is used.

NONE

Removes the workload for the current session.

Privileges

None

Examples

The following example sets [analytics](#) as the [workload](#) for the current session:

```
-> CREATE ROUTING RULE analytic_rule ROUTE WORKLOAD analytics TO SUBCLUSTER my_subcluster;
-> SET SESSION WORKLOAD analytics;
```

SET STANDARD_CONFORMING_STRINGS

Specifies whether to treat backslashes as escape characters for the current session. By default, Vertica conforms to the SQL standard and supports SQL:2008 string literals within Unicode escapes.

Syntax

```
SET STANDARD_CONFORMING_STRINGS TO { ON | OFF }
```

Parameters

ON

(Default) Treat ordinary string literals ('...') as backslashes () literally. This means that backslashes are treated as string literals and not as escape characters.

OFF

Treat backslashes as escape characters.

Privileges

None

Requirements

- This statement works under vsql only.
- Standard-conforming strings must be ON to use Unicode-style string literals ([U&'nxxx'](#)).

Tip

You can set conforming strings across all sessions by setting the configuration parameter [StandardConformingStrings](#) with [ALTER DATABASE...SET PARAMETER](#).

Examples

Turn off conforming strings for the session:

```
=> SET STANDARD_CONFORMING_STRINGS TO OFF;
```

Verify the current setting:

```
=> SHOW STANDARD_CONFORMING_STRINGS;
  name      | setting
-----+-----
standard_conforming_strings | off
(1 row)
```

Turn on conforming strings for the session:

```
=> SET STANDARD_CONFORMING_STRINGS TO ON;
```

See also

- [SET ESCAPE_STRING_WARNING](#)
- [Standard-Conforming Strings and Escape Characters](#)

SET TIME ZONE

Changes the TIME ZONE run-time parameter for the current [session](#). Use [SHOW TIMEZONE](#) to show the session's current time zone.

If you set the timezone using POSIX format, the timezone abbreviation you use overrides the default timezone abbreviation. If the [date style](#) is set to POSTGRES, the timezone abbreviation you use is also used when converting a timestamp to a string.

Syntax

```
SET TIME ZONE [TO] { value | 'value' }
```

Note

Vertica treats literals **TIME ZONE** and **TIMEZONE** as synonyms.

Parameters

value

One of the following:

- A time zone literal supported by Vertica. To view the default list of valid literals, see the files in the following directory:

```
/opt/vertica/share/timezonesets
```

- A signed integer representing an offset from UTC in hours
- A time zone literal with a signed integer offset. For example:

```
=> SET TIME ZONE TO 'America/New York -3'; -- equivalent to Pacific time
```

Note

Only valid timezone+offset combinations are meaningful as arguments to SET TIME ZONE. However, Vertica does not return an error for meaningless combinations—for example, **America/NewYork + 150** .

- An [interval value](#)
- Constants **LOCAL** and **DEFAULT** , which respectively set the time zone to the one specified in environment variable **TZ** , or if **TZ** is undefined, to the operating system time zone.

Only valid (timezone+offset) combination are acceptable as parameter for this function.

Privileges

None

Examples

```
=> SET TIME ZONE TO DEFAULT;  
=> SET TIME ZONE TO 'PST8PDT'; -- Berkeley, California  
=> SET TIME ZONE TO 'Europe/Rome'; -- Italy  
=> SET TIME ZONE TO '-7'; -- UDT offset equivalent to PDT  
=> SET TIME ZONE TO INTERVAL '-08:00 HOURS';
```

See also

[Using time zones with Vertica](#)

In this section

- [Time zone names for setting TIME ZONE](#)

Time zone names for setting TIME ZONE

The time zone names listed below are valid settings for the SQL time zone (the TIME ZONE run-time parameter).

Note

Time zone and daylight-saving rules are controlled by individual governments and are subject to change. For the latest information, see [Sources for Time Zone and Daylight Saving Time Data](#) .

These names are not the same as the names shown in </opt/vertica/share/timezonesets>, which are recognized by Vertica in date/time input values. The TIME_ZONE names listed below imply a local Daylight Saving Time rule, where date/time input names represent a fixed offset from UTC.

In many cases, the same zone has several names. These are grouped together. The list is sorted primarily by commonly used zone names.

In addition to the names in the list, Vertica accepts time zone names as one of the following:

- *STDoffset*
- *STDoffsetDST*

where *STD* is a zone abbreviation, *offset* is a numeric offset in hours west from UTC, and *DST* is an optional Daylight Saving Time zone abbreviation, assumed to stand for one hour ahead of the given offset.

For example, if *EST5EDT* were not already a recognized zone name, Vertica accepts it as functionally equivalent to USA East Coast time. When a Daylight Saving Time zone name is present, Vertica assumes it uses USA time zone rules, so this feature is of limited use outside North America.

Caution

Be aware that this provision can lead to silently accepting invalid input, as there is no check on the reasonableness of the zone abbreviations. For example, *SET TIME_ZONE TO FOOBANKO* works, leaving the system effectively using a rather peculiar abbreviation for GMT.

SHOW

Shows run-time parameters for the current session.

Syntax

```
SHOW { parameter | ALL }
```

Parameters

ALL

Shows all run-time settings.

AUTOCOMMIT

Returns on/off to indicate whether statements automatically commit their transactions when they complete.

AVAILABLE ROLES

Lists all [roles](#) available to the user.

AVAILABLE WORKLOADS

Returns the workloads available to the user and their [enabled roles](#).

DATESTYLE

Shows the current style of date values. See [SET DATESTYLE](#).

ENABLED ROLES

Shows the roles enabled for the current session. See [SET ROLE](#).

ESCAPE_STRING_WARNING

Returns on/off to indicate whether warnings are issued when backslash escapes are found in strings. See [SET ESCAPE_STRING_WARNING](#).

GRACEPERIOD

Shows the session GRACEPERIOD set by [SET SESSION GRACEPERIOD](#).

IDLESESSIONTIMEOUT

Shows how long the session can remain idle before it times out.

INTERVALSTYLE

Shows whether units are output when printing intervals. See [SET INTERVALSTYLE](#).

LOCALE

Shows the current locale. See [SET LOCALE](#).

MEMORYCAP

Shows the maximum amount of memory that any request use. See [SET MEMORYCAP](#).

MULTIPLEACTIVERESULTSETS

Returns on/off to indicate whether multiple active result sets on one connection are allowed. See [SET SESSION MULTIPLEACTIVERESULTSETS](#).

RESOURCE POOL

Shows the resource pool that the session is using. See [SET RESOURCE POOL](#).

RUNTIMECAP

Shows the maximum amount of time that queries can run in the session. See [SET RUNTIMECAP](#).

SEARCH_PATH

Shows the order in which Vertica searches schemas. See [SET SEARCH_PATH](#). For example:

```
=> SHOW SEARCH_PATH;
 name |          setting
-----+-----
search_path | "$user", public, v_catalog, v_monitor, v_internal
(1 row)
```

STANDARD_CONFORMING_STRINGS

Shows whether backslash escapes are enabled for the session. See [SET STANDARD_CONFORMING_STRINGS](#).

TEMPSPACECAP

Shows the maximum amount of temporary file space that queries can use in the session. See [SET TEMPSPACECAP](#).

TIMEZONE

Shows the timezone set in the current session. See [SET TIMEZONE](#).

TRANSACTION_ISOLATION

Shows the current transaction isolation setting, as described in [SET SESSION CHARACTERISTICS AS TRANSACTION](#). For example:

```
=> SHOW TRANSACTION_ISOLATION;
 name | setting
-----+-----
transaction_isolation | READ COMMITTED
(1 row)
```

TRANSACTION_READ_ONLY

Returns true/false to indicate the current read-only setting, as described in [SET SESSION CHARACTERISTICS AS TRANSACTION](#). For example:

```
=> SHOW TRANSACTION_READ_ONLY;
 name | setting
-----+-----
transaction_read_only | false
(1 row)
```

WORKLOAD

Shows the [workloads](#) associated with the current session.

Privileges

None

Examples

Display all current runtime parameter settings:

```
=> SHOW ALL;
```

name	setting
locale	en_US@collation=binary (LEN_KBINARY)
autocommit	off
standard_conforming_strings	on
escape_string_warning	on
multipleactiveresultsets	off
datestyle	ISO, MDY
intervalstyle	plain
timezone	America/New_York
search_path	"\$user", public, v_catalog, v_monitor, v_internal, v_func
transaction_isolation	READ COMMITTED
transaction_read_only	false

idle_session_timeout	UNLIMITED
graceperiod	UNLIMITED
enabled_roles	dbduser*, dbadmin*, pseudosuperuser*
available_roles	dbduser*, dbadmin*, pseudosuperuser*
tcp_keepalive	idle_time: [7200], probe_interval: [75], probe_count: [9]
workload	analytics

(21 rows)

SHOW CURRENT

Displays active configuration parameter values that are set at all levels. Vertica first checks values set at the session level. If a value is not set for a configuration parameter at the session level, Vertica next checks if the value is set for the node where you are logged in, and then checks the database level. If no values are set, **SHOW CURRENT** shows the default value for the configuration parameter. If the configuration parameter requires a restart to take effect, the active values shown might differ from the set values.

Syntax

```
SHOW CURRENT { parameter-name[,...] | ALL }
```

Parameters

parameter-name

Names of configuration parameters to show.

ALL

Shows all configuration parameters set at all levels.

Privileges

Non-superuser: **SHOW CURRENT ALL** returns masked parameter settings. Attempts to view specific parameter settings return an error.

Examples

Show configuration parameters and their settings at all levels.

```
=> SHOW CURRENT ALL;
```

level	name	setting
DEFAULT	ActivePartitionCount	1
DEFAULT	AdvanceAHMInterval	180
DEFAULT	AHMBackupManagement	0
DATABASE	AnalyzeRowCountInterval	3600
SESSION	ForceUDxFencedMode	1
NODE	MaxClientSessions	0
...		

SHOW DATABASE

Displays configuration parameter values that are set for the database.

Important

You can also get detailed information on configuration parameters, including their current and default values, by querying system table [CONFIGURATION_PARAMETERS](#).

Note

If the configuration parameter is set but requires a database restart to take effect, the value shown might differ from the active value.

Syntax

```
SHOW DATABASE db-spec { parameter-name[,...] | ALL }
```

Parameters

db-spec

Specifies the current database, set to the database name or **DEFAULT**.

parameter-name

Names of one or more configuration parameters to show. Non-superusers can only specify parameters whose settings are not masked by **SHOW DATABASE...ALL**, otherwise Vertica returns an error.

If you specify a single parameter that is not set, **SHOW DATABASE** returns an empty row for that parameter.

To obtain the names of database-level parameters, query system table [CONFIGURATION_PARAMETERS](#).

ALL

Shows all configuration parameters set at the database level. For non-superusers, Vertica masks settings of security parameters, which only superusers can access.

Privileges

- Superuser: Shows all database parameter settings.
- Non-superuser: Masks all security parameter settings, which only superusers can access. To determine which parameters require superuser privileges, query system table [CONFIGURATION_PARAMETERS](#).

Examples

Show to a non-superuser all configuration parameters that are set on the database:

```
=> SHOW DATABASE DEFAULT ALL;
  name      | setting
-----+-----
AllowNumericOverflow | 1
CopyFaultTolerantExpressions | 1
GlobalHeirUsername | *****
MaxClientSessions | 50
NumericSumExtraPrecisionDigits | 0
(6 rows)
```

Show settings for two configuration parameters:

```
=> SHOW DATABASE DEFAULT AllowNumericOverflow, NumericSumExtraPrecisionDigits;
  name      | setting
-----+-----
AllowNumericOverflow | 1
NumericSumExtraPrecisionDigits | 0
(2 rows)
```

SHOW NODE

Displays configuration parameter values that are set for a node. If you specify a parameter that is not set, **SHOW NODE** returns an empty row for that parameter.

Note

If the configuration parameter is set but requires a database restart to take effect, the value shown might differ from the active value.

Syntax

```
SHOW NODE node-name { parameter-name [...] | ALL }
```

Parameters

node-name

Name of the target node.

parameter-name

Names of one or more node-level configuration parameters. To obtain the names of node-level parameters, query system table [CONFIGURATION_PARAMETERS](#).

ALL

Shows all configuration parameters set at the node level.

Privileges

None

Examples

View all configuration parameters and their settings for node **v_vmart_node0001** :

```
=> SHOW NODE v_vmart_node0001 ALL;
  name      | setting
-----+-----
DefaultIdleSessionTimeout | 5 hour
MaxClientSessions          | 20
```

SHOW SESSION

Displays configuration parameter values that are set for the current session. If you specify a parameter that is not set, **SHOW SESSION** returns an empty row for that parameter.

Note

If the configuration parameter is set but requires a database restart to take effect, the value shown might differ from the active value.

Syntax

```
SHOW SESSION { ALL | UDPARAMETER ALL }
```

Parameters

ALL

Shows all Vertica configuration parameters set at the session level.

UDPARAMETER ALL

Shows all parameters defined by user-defined extensions. These parameters are not shown in the [CONFIGURATION_PARAMETERS](#) table.

Privileges

None

Examples

View all Vertica configuration parameters and their settings for the current session. User-defined parameters are not included:

```
=> SHOW SESSION ALL;
name                |                setting
-----+-----
locale              | en_US@collation=binary (LEN_KBINARY)
autocommit          | off
standard_conforming_strings | on
escape_string_warning | on
datestyle           | ISO, MDY
intervalstyle       | plain
timezone            | America/New_York
search_path         | "$user", public, v_catalog, v_monitor, v_internal
transaction_isolation | READ COMMITTED
transaction_read_only | false
resource_pool       | general
memorycap           | UNLIMITED
tempstoragecap      | UNLIMITED
runtimecap          | UNLIMITED
enabled roles       | dbduser*, dbadmin*, pseudosuperuser*
available roles     | dbduser*, dbadmin*, pseudosuperuser*
ForceUDxFencedMode | 1
(17 rows)
```

SHOW USER

Displays configuration parameter settings for database users. To get the names of user-level parameters, query system table [CONFIGURATION_PARAMETERS](#) :

```
SELECT parameter_name, allowed_levels FROM configuration_parameters
WHERE allowed_levels ilike '%USER%' AND parameter_name ilike '%depot%';
parameter_name | allowed_levels
-----+-----
UseDepotForWrites | SESSION, USER, DATABASE
DepotOperationsForQuery | SESSION, USER, DATABASE
UseDepotForReads | SESSION, USER, DATABASE
(3 rows)
```

Syntax

```
SHOW USER { user-name | ALL } [PARAMETER] { cfg-parameter [...] | ALL }
```

Parameters

user-name | ALL

Show parameter settings for the specified user, or for all users.

[PARAMETER] ***parameter-list***

A comma-delimited list of user-level configuration parameters.

PARAMETER ALL

Show all configuration parameters that are set for the specified users.

Privileges

Non-superusers: Can view only their own configuration parameter settings.

Examples

The following example shows configuration parameter settings for two users, Yvonne and Ahmed:

```
=> SELECT user_name FROM v_catalog.users WHERE user_name != 'dbadmin';
user_name
-----
Ahmed
Yvonne
(2 rows)
```

```
=> SHOW USER Yvonne PARAMETER ALL;
```

user	parameter	setting
------	-----------	---------

Yvonne	DepotOperationsForQuery	Fetches
--------	-------------------------	---------

(1 row)

```
=> ALTER USER Yvonne SET PARAMETER UseDepotForWrites = 0;
```

```
ALTER USER
```

```
=> SHOW USER Yvonne PARAMETER ALL;
```

user	parameter	setting
------	-----------	---------

Yvonne	DepotOperationsForQuery	Fetches
--------	-------------------------	---------

Yvonne	UseDepotForWrites	0
--------	-------------------	---

(2 rows)

```
=> ALTER USER Ahmed SET PARAMETER DepotOperationsForQuery = 'Fetches';
```

```
ALTER USER
```

```
=> SHOW USER ALL PARAMETER ALL;
```

user	parameter	setting
------	-----------	---------

Ahmed	DepotOperationsForQuery	Fetches
-------	-------------------------	---------

Yvonne	DepotOperationsForQuery	Fetches
--------	-------------------------	---------

Yvonne	UseDepotForWrites	0
--------	-------------------	---

(3 rows)

See also

[ALTER USER](#)

START TRANSACTION

Starts a transaction block.

Syntax

```
START TRANSACTION [ isolation_level ]
```

where *isolation_level* is one of:

```
ISOLATION LEVEL { SERIALIZABLE | REPEATABLE READ | READ COMMITTED | READ UNCOMMITTED } READ { ONLY | WRITE }
```

Parameters

Isolation level, described in the following table, determines what data the transaction can access when other transactions are running concurrently. The isolation level cannot be changed after the first query ([SELECT](#)) or DML statement ([INSERT](#) , [DELETE](#) , [UPDATE](#)) has run. A transaction retains its isolation level until it completes, even if the session's isolation level changes during the transaction. Vertica internal processes (such as the [Tuple Mover](#) and [refresh](#) operations) and DDL operations always run at the SERIALIZABLE isolation level to ensure consistency.

WORK | TRANSACTION

Have no effect; they are optional keywords for readability.

ISOLATION LEVEL { | SERIALIZABLE | REPEATABLE READ | READ COMMITTED | READ UNCOMMITTED }

- SERIALIZABLE: Sets the strictest level of SQL transaction isolation. This level emulates transactions serially, rather than concurrently. It holds locks and blocks write operations until the transaction completes. Not recommended for normal query operations.
- REPEATABLE READ: Automatically converted to SERIALIZABLE by Vertica.
- READ COMMITTED (Default): Allows concurrent transactions. Use READ COMMITTED isolation for normal query operations, but be aware that there is a subtle difference between them. See [Transactions](#) for more information.
- READ UNCOMMITTED: Automatically converted to READ COMMITTED by Vertica.

READ {WRITE | ONLY}

Determines whether the transaction is read/write or read-only. Read/write is the default.

Setting the transaction session mode to read-only disallows the following SQL commands, but does not prevent all disk write operations:

- INSERT, UPDATE, DELETE, and COPY if the table they would write to is not a temporary table
- All CREATE, ALTER, and DROP commands
- GRANT, REVOKE, and EXPLAIN if the command it would run is among those listed.

Privileges

None

Notes

[BEGIN](#) performs the same function as START TRANSACTION.

Examples

This example shows how to start a transaction.

```
= > START TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
START TRANSACTION
=> CREATE TABLE sample_table (a INT);
CREATE TABLE
=> INSERT INTO sample_table (a) VALUES (1);
OUTPUT
-----
1
(1 row)
```

See also

- [Transactions](#)
- [Creating and rolling back transactions](#)
- [COMMIT](#)
- [END](#)
- [ROLLBACK](#)

TRUNCATE TABLE

Removes all storage associated with a table, while leaving the table definition intact. TRUNCATE TABLE auto-commits the current transaction after statement execution and cannot be rolled back.

TRUNCATE TABLE also performs the following actions:

- Removes all table history preceding the current epoch. After TRUNCATE TABLE returns, AT EPOCH queries on the truncated table return nothing.
- Drops all [table](#) - and [partition](#) -level statistics.

Syntax

```
TRUNCATE TABLE [{{namespace. | database. }}schema.]table-name
```

Parameters

{ ***namespace.*** | ***database.*** }

Name of the database or [namespace](#) that contains *table* , depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be [default_namespace](#) .
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#) . If you specify the namespace or database name, you must provide the schema name, even if the schema is [public](#) .

table-name

The name of the anchor table or temporary table to truncate. You cannot truncate an external table.

Privileges

Non-superuser:

- Table owner
- USAGE privileges on table schema

Examples

See [Truncating tables](#) .

See also

- [DELETE](#)
- [DROP TABLE](#)

UPDATE

Replaces the values of the specified columns in all rows for which a specified condition is true. All other columns and rows in the table are unchanged. If successful, UPDATE returns the number of rows updated. A count of 0 indicates no rows matched the condition.

Important

The Vertica implementation of UPDATE differs from traditional databases. It does not delete data from disk storage; it writes two rows, one with new data and one marked for deletion. Rows marked for deletion remain available for historical queries.

Syntax

```
UPDATE [{namespace. | database. }]schema.]table-reference [AS] alias
  SET set-expression [...]  
  [ FROM from-list ]  
  [ where-clause ]
```

Note

UPDATE statements can also embed the following [hints](#):

- General: [ALLNODES](#), [EARLY_MATERIALIZATION](#), [LABEL](#), [SKIP_STATISTICS](#), [VERBATIM](#)
- Join: [SYNTACTIC_JOIN](#), [DISTRIB](#), [GBYTYPE](#), [JTYPE](#), [UTYPE](#)
- Projection: [PROJS](#), [SKIP_PROJS](#)

Parameters

{ **namespace.** | **database.** }

Name of the database or [namespace](#) that contains *table*, depending on the mode of the database:

- Eon Mode: name of the namespace to which *table* belongs. If unspecified, the namespace is assumed to be [default_namespace](#).
- Enterprise Mode: name of the database. If specified, it must be the current database.

schema

Name of the schema, by default [public](#). If you specify the namespace or database name, you must provide the schema name, even if the schema is [public](#).

table-reference

A table, one of the following:

- An optionally qualified table name with optional table aliases, column aliases, and outer joins.
- An outer join table.

You cannot update a projection.

alias

A temporary name used to reference the table.

SET set-expression

The columns to update from one or more set expressions. Each SET clause expression specifies a target column and its new value as follows:

```
column-name = { expression | DEFAULT }
```

where:

- **column-name** is any column that does not have primary key or foreign key [referential integrity](#) constraints and is not of a complex type. Native arrays are permitted.
- *expression* specifies a value to assign to the column. The expression can use the current values of this and other table columns. For example:

```
=> UPDATE T1 SET C1 = C1+1
```
- **DEFAULT** sets *column-name* to its default value, or is ignored if no default value is defined for this column.

UPDATE only modifies the columns specified by the SET clause. Unspecified columns remain unchanged.

FROM from-list

A list of table expressions, allowing columns from other tables to appear in the WHERE condition and the UPDATE expressions. This is similar to the list of tables that can be specified in the [FROM clause](#) of a SELECT command.

The FROM clause can reference the target table as follows:

```
FROM DEFAULT [join-type] JOIN table-reference [ ON join-predicate ]
```

DEFAULT specifies the table to update. This keyword can be used only once in the FROM clause, and it cannot be used elsewhere in the UPDATE statement.

Privileges

Table owner or user with GRANT OPTION is grantor.

- UPDATE privilege on table
- USAGE privilege on schema that contains the table
- SELECT privilege on the table when executing an UPDATE statement that references table column values in a WHERE or SET clause

Subqueries and joins

UPDATE supports subqueries and joins, which is useful for updating values in a table based on values that are stored in other tables. For details, see [Subqueries in UPDATE and DELETE statements](#).

Committing successive table changes

Vertica follows the SQL-92 transaction model, so successive INSERT, UPDATE, and DELETE statements are included in the same transaction. You do not need to explicitly start this transaction; however, you must explicitly end it with [COMMIT](#), or implicitly end it with [COPY](#). Otherwise, Vertica discards all changes that were made within the transaction.

Restrictions

- You cannot update an immutable table.
- You cannot update columns of [complex types](#) except for native arrays.
- If the joins specified in the FROM clause or WHERE predicate produce more than one copy of the row in the target table, the new value of the row in the table is chosen arbitrarily.
- If primary key, unique key, or check constraints are enabled for automatic enforcement in the target table, Vertica enforces those constraints when you load new data. If a violation occurs, Vertica rolls back the operation and returns an error.
- If an update would violate a table or schema disk quota, the operation fails. For more information, see [Disk quotas](#).

Examples

In the `fact` table, modify the `price` column value for all rows where the `cost` column value is greater than 100:

```
=> UPDATE fact SET price = price - cost * 80 WHERE cost > 100;
```

In the `retail.customer` table, set the `state` column to `NH` when the `CID` column value is greater than 100:

```
=> UPDATE retail.customer SET state = 'NH' WHERE CID > 100;
```

To use table aliases in UPDATE queries, consider the following two tables:

```
=> SELECT * FROM result_table;
cust_id | address
-----+-----
    20 | Lincoln Street
    30 | Beach Avenue
    30 | Booth Hill Road
    40 | Mt. Vernon Street
    50 | Hillside Avenue
(5 rows)
=> SELECT * FROM new_addresses;
new_cust_id | new_address
-----+-----
    20 | Infinite Loop
    30 | Loop Infinite
    60 | New Addresses
(3 rows)
```

The following query and subquery use table aliases to update the `address` column in `result_table` (alias `r`) with the new address from the corresponding column in the `new_addresses` table (alias `n`):

```
=> UPDATE result_table r
  SET address=n.new_address
  FROM new_addresses n
  WHERE r.cust_id = n.new_cust_id;
```

`result_table` shows the `address` field updates made for customer IDs 20 and 30:

```
=> SELECT * FROM result_table ORDER BY cust_id;
cust_id | address
-----+-----
    20 | Infinite Loop
    30 | Loop Infinite
    30 | Loop Infinite
    40 | Mt. Vernon Street
    50 | Hillside Avenue
(5 rows)
```

You cannot use UPDATE to update individual elements of native arrays. Instead, replace the entire array value. The following example uses [ARRAY_CAT](#) to add an element to an array column:

```
=> SELECT * FROM singers;
Iname | fname | bands
-----+-----
Cher | | ["Sonny and Cher"]
Jagger | Mick | ["Rolling Stones"]
Slick | Grace | ["Jefferson Airplane","Jefferson Starship"]
(3 rows)

=> UPDATE singers SET bands=ARRAY_CAT(bands,ARRAY['something new'])
  WHERE Iname='Cher';
OUTPUT
-----
    1
(1 row)

=> SELECT * FROM singers;
Iname | fname | bands
-----+-----
Jagger | Mick | ["Rolling Stones"]
Slick | Grace | ["Jefferson Airplane","Jefferson Starship"]
Cher | | ["Sonny and Cher","something new"]
(3 rows)
```

Vertica system tables

Vertica provides system tables that let you monitor your database and evaluate settings of its objects. You can query these tables just as you do other tables, depending on privilege requirements.

See also

- [Using system tables](#)
- [Monitoring Vertica](#)

In this section

- [V_CATALOG schema](#)
- [V_MONITOR schema](#)

V_CATALOG schema

The system tables in this section reside in the `v_catalog` schema. These tables provide information (metadata) about the objects in a database; for example, tables, constraints, users, projections, and so on.

ACCESS_POLICY

Provides information about existing [access policies](#) .

Column Name	Data Type	Description
ACCESS_POLICY_OID	INTEGER	The unique identifier for the access policy.
TABLE_NAME	VARCHAR	Name of the table specified in the access policy.
IS_POLICY_ENABLED	BOOLEAN	Whether the access policy is enabled.
POLICY_TYPE	VARCHAR	The type of access policy assigned to the table: <ul style="list-style-type: none"> • Column Policy • Row Policy
EXPRESSION	VARCHAR	The expression used when creating the access policy.
COLUMN_NAME	VARCHAR	The column to which the access policy is assigned. Row policies apply to all columns in the table.
TRUST_GRANTS	BOOLEAN	If true, GRANT statements override the access policy when determining whether a user can perform DML operations on the column or row.

Privileges

By default, only the superuser can view this table. Superusers can grant non-superusers access to this table with the following statement. Non-superusers can only see rows for tables that they own:

```
=> GRANT SELECT ON access_policy TO PUBLIC
```

Examples

The following query returns all access policies on table `public.customer_dimension` :

```

=> \x
=> SELECT policy_type, is_policy_enabled, table_name, column_name, expression FROM access_policy WHERE table_name =
'public.customer_dimension';
-[ RECORD 1 ]-----+-----
policy_type      | Column Policy
is_policy_enabled | Enabled
table_name       | public.customer_dimension
column_name      | customer_address
expression       | CASE WHEN enabled_role('administrator') THEN customer_address ELSE '*****' END

```

ALL_TABLES

Provides summary information about tables in a Vertica database.

Column Name	Data Type	Description
SCHEMA_NAME	VARCHAR	The name of the schema that contains the table.
TABLE_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the table.
TABLE_NAME	VARCHAR	The table name.
TABLE_TYPE	VARCHAR	The type of table, which can be one of the following: <ul style="list-style-type: none"> • TABLE • SYSTEM TABLE • VIEW • GLOBAL TEMPORARY • LOCAL TEMPORARY
REMARKS	VARCHAR	A brief comment about the table. You define this field by using the COMMENT ON TABLE and COMMENT ON VIEW commands.

Examples

```
onenode=> SELECT DISTINCT table_name, table_type FROM all_tables
```

```
WHERE table_name ILIKE 't%';
```

```
table_name | table_type
```

```
types | SYSTEM TABLE
```

```
trades | TABLE
```

```
tuple_mover_operations | SYSTEM TABLE
```

```
tables | SYSTEM TABLE
```

```
tuning_recommendations | SYSTEM TABLE
```

```
testid | TABLE
```

```
table_constraints | SYSTEM TABLE
```

```
transactions | SYSTEM TABLE
```

```
(8 rows)
```

```
onenode=> SELECT table_name, table_type FROM all_tables
```

```
WHERE table_name ILIKE 'my%';
```

```
table_name | table_type
```

```
mystocks | VIEW
```

```
(1 row)
```

```
=> SELECT * FROM all_tables LIMIT 4;
```

```
-[ RECORD 1 ]-----
```

```
schema_name | v_catalog
```

```
table_id | 10206
```

```
table_name | all_tables
```

```
table_type | SYSTEM TABLE
```

```
remarks | A complete listing of all tables and views
```

```
-[ RECORD 2 ]-----
```

AUDIT_MANAGING_USERS_PRIVILEGES

Provides summary information about privileges, creating, modifying, and deleting users, and authentication changes. This table is a join of [LOG_PARAMS](#), [LOG_QUERIES](#), and [LOG_TABLES](#) filtered on the Managing_Users_Privileges category.

Column Name	Data Type	Description
ISSUED_TIME	VARCHAR	The time at which the query was executed.
USER_NAME	VARCHAR	Name of the user who issued the query at the time Vertica recorded the session.
USER_ID	INTEGER	Numeric representation of the user who ran the query.
HOSTNAME	VARCHAR	The hostname, IP address, or URL of the database server.

SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
AUDIT_TYPE	VARCHAR	The type of operation for the audit: <ul style="list-style-type: none"> • Query • Parameter • Table
AUDIT_TAG_NAME	VARCHAR	The tag name for the specific parameter, query, or table.
REQUEST_TYPE	VARCHAR	The type of query request. Examples include, but are not limited to: <ul style="list-style-type: none"> • QUERY • DDL • LOAD • UTILITY • TRANSACTION • PREPARE • EXECUTE • SET • SHOW
REQUEST_ID	INTEGER	The ID of the privilege request.
SUBJECT	VARCHAR	The name of the table or parameter that was queried or the subject of a query.
REQUEST	VARCHAR	Lists the privilege request.
SUCCESS	VARCHAR	Indicates whether or not the operation was successful.
CATEGORY	VARCHAR	The audit parent category, Managing_Users_Privileges.

CA_BUNDLES

Stores certificate authority (CA) bundles created by [CREATE CA BUNDLE](#).

Column Name	Data Type	Description
OID	INTEGER	The object identifier.
NAME	VARCHAR	The name of the CA bundle.
OWNER	INTEGER	The OID of the owner of the CA bundle.
CERTIFICATES	INTEGER	The OIDs of the CA certificates inside the CA bundle.

Privileges

- See CA bundle OID, name, and owner: Superuser or owner of the CA bundle.
- See CA bundle contents: Owner of the bundle

Joining with CERTIFICATES

CA_BUNDLES only stores OIDs. Since operations on CA bundles require certificate and owner names, you can use the following query to map bundles to certificate and owner names:

```
=> SELECT user_name AS owner_name,
       owner AS owner_oid,
       b.name AS bundle_name,
       c.name AS cert_name
FROM (SELECT name,
      STRING_TO_ARRAY(certificates) :: array[INT] AS certs
FROM ca_bundles) b
LEFT JOIN certificates c
      ON CONTAINS(b.certs, c.oid)
LEFT JOIN users
      ON user_id = owner
ORDER BY 1;
```

```
owner_name | owner_oid | bundle_name | cert_name
-----+-----+-----+-----
dbadmin   | 45035996273704962 | ca_bundle   | root_ca
dbadmin   | 45035996273704962 | ca_bundle   | ca_cert
(2 rows)
```

See also

- [Managing CA bundles](#)
- [ALTER CA BUNDLE](#)
- [DROP CA BUNDLE](#)

CATALOG_SUBSCRIPTION_CHANGES

Lists the changes made to catalog subscriptions.

Column Name	Data Type	Description
EVENT_TIMESTAMP	TIMESTAMP	The time a catalog subscription changed.
SESSION_ID	VARCHAR	A unique numeric ID assigned by the Vertica catalog, which identifies the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
USER_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the user.
USER_NAME	VARCHAR	The user who made changes to the subscriptions.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, TRANSACTION_ID returns NULL.
SHARD_NAME	VARCHAR	The name of the shard.
SHARD_OID	INTEGER	The OID of the shard.
SUBSCRIBER_NODE_NAME	VARCHAR	The node name or names subscribed to the shard.
SUBSCRIBER_NODE_OID	INTEGER	The OID of the subscribing node or nodes.
OLD_STATE	VARCHAR	The previous state of the node subscription.
NEW_STATE	VARCHAR	The current state of the node subscription.
WAS_PRIMARY	BOOLEAN	Defines whether the node was the primary subscriber.
IS_PRIMARY	BOOLEAN	Defines whether the node is currently the primary subscriber.

CATALOG_VERSION	INTEGER	The version of the catalog at the time of the subscription change.
-----------------	---------	--

CATALOG_SYNC_STATE

Shows when an Eon Mode database node synchronized its catalog to communal storage.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
SYNC_CATALOG_VERSION	INTEGER	The version number of the catalog being synchronized.
EARLIEST_CHECKPOINT_VERSION	INTEGER	The earliest checkpoint that is maintained in communal storage.
SYNC_TRAILING_INTERVAL	INTEGER	The difference between the global catalog version and the synchronized catalog version for a node.
LAST_SYNC_AT	TIMESTAMPTZ	The date and time the last time the catalog was synchronized.

CATALOG_TRUNCATION_STATUS

Indicates how up to date the catalog is on communal storage. It is completely up to date when the current catalog version is the same as the catalog truncation version.

The catalog truncation version (CTV) is the version that Vertica cluster uses when it revives after a crash, shutdown, or hibernation. A cluster has only one CTV for all nodes in a cluster.

Column Name	Data Type	Description
CURRENT_CATALOG_VERSION	INTEGER	The version number of the catalog currently on the cluster.
TRUNCATION_CATALOG_VERSION	INTEGER	The version number as of the last time the catalog was synced on communal storage.

CERTIFICATES

Stores certificates created by [CREATE CERTIFICATE](#).

Column Name	Data Type	Description
OID	INTEGER	The object identifier.
NAME	VARCHAR	The name of the certificate.
OWNER	INTEGER	The owner of the object.
SIGNED_BY	INTEGER	The OID of the signing certificate.
PRIVATE_KEY	INTEGER	The OID of the certificate's private key .
START_DATE	TIMESTAMPTZ	When the certificate becomes valid.
EXPIRATION_DATE	TIMESTAMPTZ	When the certificate expires.
ISSUER	VARCHAR	The signing CA.
SUBJECT	VARCHAR	The entity for which the certificate is issued.
SERIAL	VARCHAR	The certificate's serial number.

x509v3_EXTENSIONS	VARCHAR	Lists additional attributes specified during the certificate's creation. For more information on extensions, see the OpenSSL documentation .
CERTIFICATE_TEXT	VARCHAR	The contents of the certificate.

Examples

See [Generating TLS certificates and keys](#).

CLIENT_AUTH

Provides information about client authentication methods.

Higher values indicate higher priorities. Vertica tries to authenticate a user with an authentication method in order of priority from highest to lowest. For example:

- A priority of 10 is higher than a priority of 5.
- A priority 0 is the lowest possible value.

Column Name	Data Type	Description
AUTH_OID	INTEGER	Unique identifier for the authentication method.
AUTH_NAME	VARCHAR	User-given name of the authentication method.
IS_AUTH_ENABLED	BOOLEAN	Indicates if the authentication method is enabled.
AUTH_HOST_TYPE	VARCHAR	The authentication host type, one of the following: <ul style="list-style-type: none"> • LOCAL • HOST • HOSTSSL • HOSTNOSSL
AUTH_HOST_ADDRESS	VARCHAR	If AUTH_HOST_TYPE is HOST, AUTH_HOST_ADDRESS is the IP address (or address range) of the remote host.
AUTH_METHOD	VARCHAR	Authentication method to be used. Valid values: <ul style="list-style-type: none"> • IDENT • GSS • HASH • LDAP • REJECT • TLS • TRUST
AUTH_PARAMETERS	VARCHAR	The parameter names and values assigned to the authentication method.
AUTH_PRIORITY	INTEGER	The priority specified for the authentication. Authentications with higher values are used first.
METHOD_PRIORITY	INTEGER	The priority of this authentication based on the AUTH_METHOD. Vertica only considers METHOD_PRIORITY when deciding between multiple authentication methods of equal AUTH_PRIORITY.

ADDRESS_PRIORITY	INTEGER	The priority of this authentication based on the specificity of the AUTH_HOST_ADDRESS, if any. More specific IP addresses (fewer zeros) are used first. Vertica only considers ADDRESS_PRIORITY when deciding between multiple authentication methods of equal AUTH_PRIORITY and METHOD_PRIORITY.
IS_FALLTHROUGH_ENABLED	Boolean	Whether authentication fallthrough is enabled.

Examples

This example shows how to get information about each client authentication method that you created:

```
=> SELECT * FROM client_auth;
  auth_oid | auth_name | is_auth_enabled | auth_host_type | auth_host_address | auth_method | auth_parameters | auth_priority | method_priority |
address_priority
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
45035996274059694 | v_gss | True | HOST | 0.0.0.0/0 | GSS | | 0 | 5 | 96
45035996274059696 | v_trust | True | LOCAL | | TRUST | | 0 | 0 | 0
45035996274059698 | v_ldap | True | HOST | 10.19.133.123/ | LDAP | | 0 | 5 | 128
45035996274059700 | RejectNoSSL | True | HOSTNOSSL | 0.0.0.0/0 | REJECT | | 0 | 10 | 96
45035996274059702 | v_hash | True | LOCAL | | HASH | | 0 | 2 | 0
45035996274059704 | v_tls | True | HOSTSSL | 1.1.1.1/0 | TLS | | 0 | 5 | 96
(6 rows)
```

See also

- [Client authentication](#)
- [Authentication record priority](#)

CLIENT_AUTH_PARAMS

Provides information about client authentication methods that have parameter values assigned.

Column Name	Data Type	Description
AUTH_OID	INTEGER	A unique identifier for the authentication method.
AUTH_NAME	VARCHAR	Name that you defined for the authentication method.
AUTH_PARAMETER_NAME	VARCHAR	Parameter name required by the authentication method. Some examples are: <ul style="list-style-type: none"> • system_users • binddn_prefix • host
AUTH_PARAMETER_VALUE	VARCHAR	Value of the specified parameter.

Examples

This example shows how to retrieve parameter names and values for all authentication methods that you created. The authentication methods that have parameters are:

- v_ident
- v_ldap
- v_ldap1

```

=> SELECT * FROM CLIENT_AUTH_PARAMS;
  auth_oid | auth_name | auth_parameter_name | auth_parameter_value
-----+-----+-----+-----
45035996273741304 | v_ident | system_users | root

45035996273741388 | v_ldap | binddn_suffix | ,dc=qa_domain,dc=com
45035996273741406 | RejectNoSSL | |
45035996273741424 | RejectWithSSL | |
45035996273741450 | v_md5 | |
45035996273904044 | l_tls | |
45035996273906566 | v_hash | |
45035996273910432 | v_ldap1 | host | ldap://172.16.65.177
45035996273910432 | v_ldap1 | basedn | dc=qa_domain,dc=com
45035996273910432 | v_ldap1 | binddn | cn=Manager,dc=qa_domain,dc=com
45035996273910432 | v_ldap1 | bind_password | secret
45035996273910432 | v_ldap1 | search_attribute | cn
(17 rows)

```

CLUSTER_LAYOUT

Shows the relative position of the actual arrangement of the nodes participating in the cluster and the fault groups (in an Enterprise Mode database) or subclusters (in an Eon Mode database) that affect them. Ephemeral nodes are not shown in the cluster layout ring because they hold no resident data.

Column Name	Data Type	Description
CLUSTER_POSITION	INTEGER	Position of the node in the cluster ring, counting forward from 0. Note An output value of 0 has no special meaning other than there are no nodes in position before the node assigned 0.
NODE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies the node.
NODE_NAME	VARCHAR	The name of the node in the cluster ring. Only permanent nodes participating in database activity appear in the cluster layout. Ephemeral nodes are not shown in the output.
FAULT_GROUP_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies the fault group. This column can only have a value in an Enterprise Mode database. Note This value matches the <code>FAULT_GROUP.MEMBER_ID</code> value, but only if this node is in a fault group; otherwise the value is NULL.
FAULT_GROUP_NAME	VARCHAR	The name of the fault group for the node. This column can only have a value in an Enterprise Mode database.

FAULT_GROUP_TIER	INTEGER	The node's depth in the fault group tree hierarchy. For example if the node: <ul style="list-style-type: none"> Is not in a fault group, output is null Is in the top level fault group, output is 0 Is in a fault group's child, output is 1 Is a fault group's grandchild, output is 2 This column can only have a value in an Enterprise Mode database.
SUBCLUSTER_ID	INTEGER	Unique identifier for the subcluster. This column only has a value in an Eon Mode database.
SUBCLUSTER_NAME	VARCHAR	The name of the subcluster containing the node. This column only has a value in an Eon Mode database.

See also

[Large cluster](#)

COLUMNS

Provides table column information. For columns of Iceberg external tables, see [ICEBERG_COLUMNS](#).

Column Name	Data Type	Description
TABLE_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the table.
TABLE_NAMESPACE	VARCHAR	For Eon Mode databases, name of the namespace that contains the table.
TABLE_SCHEMA	VARCHAR	Name of the table's schema. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
TABLE_NAME	VARCHAR	Name of the table containing the column.
IS_SYSTEM_TABLE	BOOLEAN	Whether the table is a system table.
COLUMN_ID	VARCHAR	Catalog-assigned VARCHAR value that uniquely identifies a table column.
COLUMN_NAME	VARCHAR	Name of the column.
DATA_TYPE	VARCHAR	Column data type. Arrays of primitive types show the name ARRAY[type] . Other complex types show the inline name of the type, which matches the type_name value in the COMPLEX_TYPES table. For example: _ct_45035996273833610 .
DATA_TYPE_ID	INTEGER	Catalog-assigned unique numeric ID of the data type.
DATA_TYPE_LENGTH	INTEGER	Maximum allowable length of the data type.
CHARACTER_MAXIMUM_LENGTH	VARCHAR	Maximum allowable length of a VARCHAR column.
NUMERIC_PRECISION	INTEGER	Number of significant decimal digits for a NUMERIC column.
NUMERIC_SCALE	INTEGER	Number of fractional digits for a NUMERIC column.
DATETIME_PRECISION	INTEGER	Declared precision for a TIMESTAMP column, or NULL if no precision was declared.

INTERVAL_PRECISION	INTEGER	Number of fractional digits retained in the seconds field of an INTERVAL column.
ORDINAL_POSITION	INTEGER	Column position respective to other columns in the table.
IS_NULLABLE	BOOLEAN	Whether the column can contain NULL values.
COLUMN_DEFAULT	VARCHAR	Expression set on a column with the DEFAULT constraint.
COLUMN_SET_USING	VARCHAR	Expression set on a column with the SET USING constraint.
IS_IDENTITY	BOOLEAN	Whether the column is an IDENTITY column.

Examples

```
=> SELECT table_schema, table_name, column_name, data_type, is_nullable
FROM columns WHERE table_schema = 'store'
AND data_type = 'Date';
table_schema | table_name | column_name | data_type | is_nullable
-----+-----+-----+-----+-----
store | store_dimension | first_open_date | Date | f
store | store_dimension | last_remodel_date | Date | f
store | store_orders_fact | date_ordered | Date | f
store | store_orders_fact | date_shipped | Date | f
store | store_orders_fact | expected_delivery_date | Date | f
store | store_orders_fact | date_delivered | Date | f
(6 rows)
```

In the following query, **datetime_precision** is NULL because the table definition declares no precision:

```
=> CREATE TABLE c (c TIMESTAMP);
CREATE TABLE
=> SELECT table_name, column_name, datetime_precision FROM columns
WHERE table_name = 'c';
table_name | column_name | datetime_precision
-----+-----+-----
c | c |
(1 row)
```

In the following example, timestamp precision is set:

```
=> DROP TABLE c;
=> CREATE TABLE c (c TIMESTAMP(4));
CREATE TABLE
=> SELECT table_name, column_name, datetime_precision FROM columns
WHERE table_name = 'c';
table_name | column_name | datetime_precision
-----+-----+-----
c | c | 4
```

An **IDENTITY** column sequence is defined in a table's DDL. Column values automatically increment as new rows are added. The following query returns identity columns:

```
=> CREATE TABLE employees (employeeID IDENTITY, lname varchar(36), fname varchar(36));
CREATE TABLE
=> SELECT table_name, column_name, is_identity FROM columns WHERE is_identity = 't';
table_name | column_name | is_identity
-----+-----+-----
employees | employeeID | t
(1 row)
```

You can query the [SEQUENCES](#) table to get detailed information about an IDENTITY column sequence:

```

-> SELECT sequence_schema, sequence_name, identity_table_name, sequence_id FROM sequences WHERE identity_table_name='employees';
sequence_schema | sequence_name | identity_table_name | sequence_id
-----
public | employees_employeeID_seq | employees | 45035996273848816
(1 row)

```

For details about sequences and IDENTITY columns, see [Sequences](#).

COMMENTS

Returns information about comments associated with objects in the database.

Note

Queries on this table can be slow because it fetches data at query time from other Vertica catalog tables.

Column Name	Data Type	Description
COMMENT_ID	INTEGER	Comment's internal ID number
OBJECT_ID	INTEGER	Internal ID number of the object associated with the comment.
OBJECT_TYPE	VARCHAR	Type of object associated with the comment, one of the following: <ul style="list-style-type: none"> • COLUMN • CONSTRAINT • FUNCTION • LIBRARY • NODE • PROJECTION • SCHEMA • SEQUENCE • TABLE • VIEW
OBJECT_SCHEMA	VARCHAR	Name of the schema containing the object.
OBJECT_NAME	VARCHAR	Name of the top-level object associated with the comment, such as a table or projection.
CHILD_OBJECT	VARCHAR	Name of the specific object associated with the comment, such as a table column. If the comment is associated with a top-level object, this value is NULL.
OWNER_ID	VARCHAR	Internal ID of the object's owner.
OWNER_NAME	VARCHAR	Object owner's name.
CREATION_TIME	TIMESTAMPTZ	When the comment was created.
LAST_MODIFIED_TIME	TIMESTAMPTZ	When the comment was last modified.
COMMENT	VARCHAR	Comment text.

Examples

```
=> COMMENT ON COLUMN public.t.x1 IS 'Column comment';
```

```
=> SELECT * FROM COMMENTS;
```

```
{ RECORD 1 }-----  
comment_id | 45035996273838776  
object_id  | 45035996273838760  
object_type | COLUMN  
object_schema | public  
object_name | t  
child_object | x1  
owner_id   | 45035996273704962  
owner_name | dbadmin  
creation_time | 2023-02-01 10:47:13.028663+08  
last_modified_time | 2023-02-01 10:47:13.028663+08  
comment    | Column comment
```

COMPLEX_TYPES

Contains information about inlined [complex types](#).

Each complex type in each external table has a unique type internally, even if the types are structurally the same (like two different ROW(int,int) cases). This inlined type is created when the table using it is created and is automatically dropped when the table is dropped. Inlined complex types cannot be shared or reused in other tables.

Each row in the COMPLEX_TYPES table represents one component (field) in one complex type. A ROW produces one row per field, an ARRAY produces one, and a MAP produces two.

Arrays of primitive types used in native (ROS) tables are not included in the COMPLEX_TYPES table. They are included instead in the [TYPES](#) table.

This table does not include complex types in [Iceberg tables](#).

Column Name	Data Type	Description
TYPE_ID	INTEGER	A unique identifier for the inlined complex type.
TYPE_KIND	VARCHAR	The specific kind of complex type: row, array, or map.
TYPE_NAME	VARCHAR	The generated name of this type. All names begin with <code>_ct_</code> followed by a number.
FIELD_ID	INTEGER	A unique identifier for the field.
FIELD_NAME	VARCHAR	The name of the field, if specified in the table definition, or a generated name beginning with "f".
FIELD_TYPE_NAME	VARCHAR	The type of the field's value.
FIELD_POSITION	INTEGER	The field's position in its containing complex type (0-based).
FIELD_LENGTH	INTEGER	Number of bytes in the field value, or -1 if the value is not a scalar type.
CHARACTER_MAXIMUM_LENGTH	INTEGER	Maximum allowable length of the column.
NUMERIC_PRECISION	INTEGER	Number of significant decimal digits.
NUMERIC_SCALE	INTEGER	Number of fractional digits.
DATETIME_PRECISION	INTEGER	For TIMESTAMP data type, returns the declared precision; returns NULL if no precision was declared.

INTERVAL_PRECISION	INTEGER	Number of fractional digits retained in the seconds field.
--------------------	---------	--

Examples

The following example shows the type and field values after defining a single external table.

```
=> CREATE EXTERNAL TABLE warehouse(
  name VARCHAR, id_map MAP<INT,VARCHAR>,
  data row(record INT, total FLOAT, description VARCHAR(100)),
  prices ARRAY[INT], comment VARCHAR(200), sales_total FLOAT, storeID INT)
AS COPY FROM ... PARQUET;

=> SELECT type_id,type_kind,type_name,field_id,field_name,field_type_name,field_position
FROM COMPLEX_TYPES ORDER BY type_id,field_name;

type_id | type_kind | type_name | field_id | field_name | field_type_name | field_position
-----+-----+-----+-----+-----+-----+-----
45035996274278280 | Map | |_ct_45035996274278280 | 6 | key | int | 0
45035996274278280 | Map | |_ct_45035996274278280 | 9 | value | varchar(80) | 1
45035996274278282 | Row | |_ct_45035996274278282 | 9 | description | varchar(80) | 2
45035996274278282 | Row | |_ct_45035996274278282 | 6 | record | int | 0
45035996274278282 | Row | |_ct_45035996274278282 | 7 | total | float | 1
45035996274278284 | Array | |_ct_45035996274278284 | 6 | | int | 0
(6 rows)
```

CONSTRAINT_COLUMNS

Records information about table column constraints.

Column Name	Data Type	Description
CONSTRAINT_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog that identifies the constraint.
TABLE_NAMESPACE	VARCHAR	For Eon Mode databases, name of the namespace that contains the table.
TABLE_SCHEMA	VARCHAR	Name of the schema that contains this table. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <code>n1.s</code> refers to schema <code>s</code> in namespace <code>n1</code> .
TABLE_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog that identifies the table.
TABLE_NAME	VARCHAR	Name of the table in which the column resides.
COLUMN_NAME	VARCHAR	Name of the column that is constrained. For check constraints, if more than one column is referenced, each appears as a separate row.
CONSTRAINT_NAME	VARCHAR	Constraint name for which information is listed.
CONSTRAINT_TYPE	CHAR	The constraint type, one of the following: <ul style="list-style-type: none"> <code>c</code>: check <code>f</code>: foreign <code>n</code>: not null <code>p</code>: primary <code>u</code>: unique

IS_ENABLED	BOOLEAN	Indicates whether a constraint for a primary key, unique key, or check constraint is currently enabled.
REFERENCE_TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the referenced table
REFERENCE_TABLE_NAMESPACE	VARCHAR	For Eon Mode databases, references the TABLE_NAMESPACE column in the PRIMARY_KEYS table.
REFERENCE_TABLE_SCHEMA	VARCHAR	Schema name for which information is listed. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
REFERENCE_TABLE_NAME	VARCHAR	References the TABLE_NAME column in the PRIMARY_KEYS table.
REFERENCE_COLUMN_NAME	VARCHAR	References the COLUMN_NAME column in the PRIMARY_KEYS table.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

CRYPTOGRAPHIC_KEYS

Stores private keys created by [CREATE KEY](#).

Column Name	Data Type	Description
OID	INTEGER	The object identifier.
NAME	VARCHAR	Name of the key.
OWNER	INTEGER	The owner of the object.
TYPE	INTEGER	The type of key. <ul style="list-style-type: none"> • 0 = AES • 1 = RSA
LENGTH	INTEGER	The size of the key in bits.
HAS_PASSWORD	BOOLEAN	Whether the key has a password.
KEY	VARCHAR	The private key.

Examples

See [Generating TLS certificates and keys](#).

DATABASES

Provides information about the databases in this Vertica installation.

Column Name	Data Type	Description
DATABASE_ID	INTEGER	The database's internal ID number
DATABASE_NAME	VARCHAR	The database's name

OWNER_ID	INTEGER	The database owner's ID
OWNER_NAME	INTEGER	The database owner's name
START_TIME	TIMESTAMPTZ	The date and time the database last started
COMPLIANCE_MESSAGE	VARCHAR	Message describing the current state of the database's license compliance
EXPORT_SUBNET	VARCHAR	Can be either of the following: <ul style="list-style-type: none"> The subnet (on the public network) used by the database for import/export The public address of the subnet that the Vertica native load balancing uses for load balancing
LOAD_BALANCE_POLICY	VARCHAR	The current native connection load balance policy, which controls whether client connection requests are redirected to other hosts in the database. See About native connection load balancing .
BACKEND_ADDRESS_FAMILY	VARCHAR	The Internet Protocol (IP) addressing standard used for internode communications. This value is either ipv4 or ipv6.
BRANCH_NAME	VARCHAR	This column is no longer used.

Examples

This example queries the databases table from a master database.

```
=> SELECT * FROM DATABASES;
-[ RECORD 1 ]-----+-----
database_id      | 45035996273704976
database_name    | VMart
owner_id         | 45035996273704962
owner_name       | dbadmin
start_time       | 2017-10-22 05:16:22.066961-04
compliance_message | The database is in compliance with respect to raw data size.
export_subnet    | 0
load_balance_policy | none
backend_address_family | ipv4
branch_name      |
```

DIRECTED_QUERIES

Returns information about directed queries.

Column Name	Data Type	Description
-------------	-----------	-------------

QUERY_NAME	VARCHAR	<p>Directed query's unique identifier, used by statements such as ACTIVATE DIRECTED QUERY. How this identifier is set depends on how it was created:</p> <ul style="list-style-type: none"> • Direct call to CREATE DIRECTED QUERY: Set by the user-supplied <i>query-name</i> argument. • Call to SAVE_PLANS: Concatenated from the following strings: <div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 5px 0;"><code>save_plans_query-label_query-number_save-plans-version</code></div> <p>where:</p> <ul style="list-style-type: none"> • <i>query-label</i> is a LABEL hint embedded in the input query associated with this directed query. If the input query contains no label, then this string is set to <code>nolabel</code>. • <i>query-number</i> is an integer in a continuous sequence between 0 and <i>budget-query</i>, which uniquely identifies this directed query from others in the same SAVE_PLANS-generated set. • <code>[save-plans-version]/[sql-reference/system-tables/v-catalog-schema/directed-queries.html#SAVE_PLANS_VERSION]</code> identifies the set of directed queries to which this directed query belongs.
IS_ACTIVE	BOOLEAN	Whether the directed query is active
VERTICA_VERSION	VARCHAR	Vertica version installed when this directed query was created.
COMMENT	VARCHAR	User-supplied or optimizer-generated comment on a directed query, up to 128 characters.
SAVE_PLANS_VERSION	INTEGER	<p>One of the following:</p> <ul style="list-style-type: none"> • 0: Generated by a direct call to CREATE DIRECTED QUERY. • >0: Identifies a set of directed queries that were generated by the same call to SAVE_PLANS. All directed queries of the set share the same <code>SAVE_PLANS_VERSION</code> integer, which increments by 1 the previous highest <code>SAVE_PLANS_VERSION</code> setting. Use this identifier to activate, deactivate, and drop a set of directed queries.
USERNAME	VARCHAR	User that created this directed query.
CREATION_DATE	VARCHAR	When the directed query was created.
SINCE_DATE	VARCHAR	Populated by SAVE_PLANS-generated directed queries, the earliest timestamp of input queries eligible to be saved as directed queries.
INPUT_QUERY	VARCHAR	Input query associated with this directed query. Multiple directed queries can map to the same input query.
ANNOTATED_QUERY	VARCHAR	Query with embedded hints that was paired with the input query of this directed query, where the hints encapsulated the query plan saved with CREATE DIRECTED QUERY .
DIGEST	INTEGER	Hash of saved query plan data, used by the optimizer to map identical input queries to the same active directed query.

Privileges

[Superuser](#)

Truncated query results

Query results for the fields INPUT_QUERY and ANNOTATED_QUERY are truncated after ~32K characters. You can get the full content of both fields in two ways:

- Use the statement [GET DIRECTED QUERY](#).
- Use [EXPORT_CATALOG](#) to export directed queries.

DUAL

DUAL is a single-column "dummy" table with one record whose value is X; for example:

```
=> SELECT * FROM DUAL;
dummy
-----
X
(1 row)
```

You can write the following types of queries:

```
=> SELECT 1 FROM dual;
?column?
-----
1
(1 row)
=> SELECT current_timestamp, current_user FROM dual;
?column?      | current_user
-----+-----
2010-03-08 12:57:32.065841-05 | release
(1 row)
=> CREATE TABLE t1(col1 VARCHAR(20), col2 VARCHAR(2));
=> INSERT INTO T1(SELECT 'hello' AS col1, 1 AS col2 FROM dual);
=> SELECT * FROM t1;
col1 | col2
-----+-----
hello | 1
(1 row)
```

Restrictions

You cannot create [projections](#) for DUAL.

ELASTIC_CLUSTER

Returns information about cluster elasticity, such as whether [Elastic cluster](#) is running.

Column Name	Data Type	Description
SCALING_FACTOR	INTEGER	This value is only meaningful when you enable local segments. SCALING_FACTOR influences the number of local segments on each node. Initially—before a rebalance runs—there are <i>scaling_factor</i> number of local segments per node. A large SCALING_FACTOR is good for rebalancing a potentially wide range of cluster configurations quickly. However, too large a value might lead to ROS pushback , particularly in a database with a table with a large number of partitions. See SET_SCALING_FACTOR for more details.
MAXIMUM_SKEW_PERCENT	INTEGER	This value is only meaningful when you enable local segments. MAXIMUM_SKEW_PERCENT is the maximum amount of skew a rebalance operation tolerates, which preferentially redistributes local segments; however, if after doing so the segment ranges of any two nodes differs by more than this amount, rebalance will separate and distribute storage to even the distribution.
SEGMENT_LAYOUT	VARCHAR	Current, offset=0, segment layout. New segmented projections will be created with this layout, with segments rotated by the corresponding offset. Existing segmented projections will be rebalanced into an offset of this layout.
LOCAL_SEGMENT_LAYOUT	VARCHAR	Similar to SEGMENT_LAYOUT but includes details that indicate the number of local segments, their relative size and node assignment.
VERSION	INTEGER	Number that gets incremented each time the cluster topology changes (nodes added, marked ephemeral, marked permanent, etc). Useful for monitoring active and past rebalance operations.
IS_ENABLED	BOOLEAN	True if Elastic Cluster is enabled, otherwise false.

IS_LOCAL_SEGMENT_ENABLED	BOOLEAN	True if local segments are enabled, otherwise false.
IS_REBALANCE_RUNNING	BOOLEAN	True if rebalance is currently running, otherwise false.

Privileges

Superuser

- [Elastic cluster](#)

EPOCHS

For the most recently closed epochs, lists the date and time of the close and the corresponding epoch number of the closed epoch. The EPOCHS table may return a varying number of rows depending on current commit activities.

Column Name	Data Type	Description
EPOCH_CLOSE_TIME	DATETIME	The date and time that the epoch closed.
EPOCH_NUMBER	INTEGER	The epoch number of the closed epoch.

Examples

```
=> SELECT * FROM EPOCHS;
 epoch_close_time | epoch_number
-----+-----
2018-11-12 16:05:15.552571-05 |      16
(1 row)
```

Querying for historical data

If you need historical data about epochs and corresponding date information, query the DC_TRANSACTION_ENDS table.

```
=> select dc.end_epoch,min(dc.time),max(dc.time) from dc_transaction_ends dc group by end_epoch;
end_epoch |      min      |      max
-----+-----+-----
214 | 2018-10-12 08:05:47.02075-04 | 2018-10-15 10:22:24.015292-04
215 | 2018-10-15 10:22:47.015172-04 | 2018-10-15 13:00:44.888984-04
...
226 | 2018-10-15 15:03:47.015235-04 | 2018-10-15 20:37:34.346667-04

FAULT_GROUPS

View the fault groups and their hierarchy in the cluster.

Column Name	Data Type	Description
MEMBER_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies the fault group.
MEMBER_TYPE	VARCHAR	The type of fault group. Values can be either NODE or FAULT GROUP .

MEMBER_NAME	VARCHAR	Name associated with this fault group. Values will be the node name or the fault group name.
PARENT_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies the parent fault group. The parent fault group can contain: <ul style="list-style-type: none"> • Nodes • Other fault groups • Nodes and other fault groups
PARENT_TYPE	VARCHAR	The type of parent fault group, where the default/root parent is the DATABASE object. Can be one of the following objects: <ul style="list-style-type: none"> • FAULT GROUP • DATABASE
PARENT_NAME	VARCHAR	The name of the fault group that contains nodes or other fault groups or both nodes and fault groups.
IS_AUTOMATICALLY_GENERATED	BOOLEAN	If true, denotes whether Vertica Analytic Database created fault groups for you to manage the fault tolerance of control nodes in large cluster configurations. If false, denotes that you created fault groups manually. See Fault Groups for more information

Examples

Show the current hierarchy of fault groups in the cluster:

```

vmartdb=> SELECT member_type, member_name, parent_type, CASE
    WHEN parent_type = 'DATABASE' THEN "
    ELSE parent_name END FROM fault_groups
    ORDER BY member_name;
member_type | member_name      | parent_type | parent_name
-----+-----+-----+-----
NODE      | v_vmart_node0001 | FAULT GROUP | two
NODE      | v_vmart_node0002 | FAULT GROUP | two
NODE      | v_vmart_node0003 | FAULT GROUP | three
FAULT GROUP | one              | DATABASE   |
FAULT GROUP | three           | DATABASE   |
FAULT GROUP | two             | FAULT GROUP | one

```

View the distribution of the segment layout:

```

vmartdb=> SELECT segment_layout from elastic_cluster;
segment_layout
-----
v_vmart_node0001[33.3%] v_vmart_node0003[33.3%] v_vmart_node0004[33.3%]
(1 row)

```

FOREIGN_KEYS

Provides foreign key information.

Column Name	Data Type	Description
CONSTRAINT_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the constraint.

CONSTRAINT_NAME	VARCHAR	The constraint name for which information is listed.
COLUMN_NAME	VARCHAR	The name of the column that is constrained.
ORDINAL_POSITION	VARCHAR	The position of the column within the key. The numbering of columns starts at 1.
TABLE_NAME	VARCHAR	The table name for which information is listed.
REFERENCE_TABLE_NAME	VARCHAR	References the TABLE_NAME column in the PRIMARY_KEYS table.
CONSTRAINT_TYPE	VARCHAR	The constraint type, <i>f</i> , for foreign key.
REFERENCE_COLUMN_NAME	VARCHAR	References the COLUMN_NAME column in the PRIMARY_KEY table.
TABLE_NAMESPACE_ID	VARCHAR	Unique numeric identifier for the table namespace .
TABLE_NAMESPACE	VARCHAR	For Eon Mode databases, namespace that contains the table for which information is listed.
TABLE_SCHEMA	VARCHAR	The schema name for which information is listed. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <i>n1.s</i> refers to schema <i>s</i> in namespace <i>n1</i> .
REFERENCE_TABLE_NAMESPACE_ID	VARCHAR	For Eon Mode databases, references the TABLE_NAMESPACE_ID column in the PRIMARY_KEYS table.
REFERENCE_TABLE_NAMESPACE	VARCHAR	For Eon Mode databases, references the TABLE_NAMESPACE column in the PRIMARY_KEYS table.
REFERENCE_TABLE_SCHEMA	VARCHAR	References the TABLE_SCHEMA column in the PRIMARY_KEYS table. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <i>n1.s</i> refers to schema <i>s</i> in namespace <i>n1</i> .

Examples

```

mydb=> SELECT
    constraint_name,
    table_name,
    ordinal_position,
    reference_table_name
FROM foreign_keys ORDER BY 3;
constraint_name | table_name | ordinal_position | reference_table_name

```

(26 rows)

```

GRANTS

Returns information about privileges that are explicitly granted on database objects. Information about [inherited privileges](#) is not included.

Note

While an ADMIN OPTION granted to users through roles is not viewable directly from this table, you can view it and a summary of privileges data with vsql meta-commands [\z](#) and [\dp](#).

Column Name	Data Type	Description
GRANTEE	VARCHAR	The user being granted permission.
GRANTEE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the user granted permissions.
GRANT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the grant operation.
GRANTOR	VARCHAR	The user granting the permission.
GRANTOR_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the user who performed the grant operation.
OBJECT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the object granted.

OBJECT_NAME	VARCHAR	The name of the object that is being granted privileges. Note that for schema privileges, the schema name appears in the OBJECT_NAME column instead of the OBJECT_SCHEMA column.
OBJECT_NAMESPACE	VARCHAR	For Eon Mode databases, namespace of the object that is being granted privileges.
OBJECT_SCHEMA	VARCHAR	Schema of the object that is being granted privileges. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
OBJECT_TYPE	VARCHAR	The object type on which the grant was applied—for example, ROLE, SCHEMA, DATABASE, RESOURCEPOOL.
PRIVILEGES_DESCRIPTION	VARCHAR	Lists the privileges granted on an object—for example INSERT, SELECT. An asterisk in PRIVILEGES_DESCRIPTION output shows that the privilege grant included WITH GRANT OPTION .

Examples

The following query shows the privileges that are granted to user Rob or role R1. An asterisk (*) appended to a privilege indicates that the user can grant the privilege to other users:

```
=> SELECT grantor,privileges_description,object_name,object_type,grantee FROM grants WHERE grantee='Rob' OR grantee='R1';
grantor | privileges_description | object_name | object_type | grantee
-----+-----+-----+-----+-----
dbadmin | USAGE                | general    | RESOURCEPOOL | Rob
dbadmin | USAGE, CREATE        | s1        | SCHEMA      | Rob
dbadmin | INSERT*, SELECT*, UPDATE* | t1        | TABLE     | Rob
dbadmin | SELECT               | t1        | TABLE     | R1
dbadmin | USAGE                | s1        | SCHEMA      | R1
dbadmin |                      | R1        | ROLE       | Rob
(6 rows)
```

HCATALOG_COLUMNS

Describes the columns of all tables available through the HCatalog Connector. Each row in this table corresponds to to a column in a table accessible through the HCatalog Connector. See [Using the HCatalog Connector](#) for more information.

Column Name	Data Type	Description
TABLE_SCHEMA	VARCHAR(128)	The name of the Vertica Analytic Database schema that contains the table containing this column
HCATALOG_SCHEMA	VARCHAR(128)	The name of the Hive schema or database that contains the table containing this column
TABLE_NAME	VARCHAR(128)	The name of the table that contains the column
IS_PARTITION_COLUMN	BOOLEAN	Whether the table is partitioned on this column
COLUMN_NAME	VARCHAR(128)	The name of the column
HCATALOG_DATA_TYPE	VARCHAR(128)	The Hive data type of this column
DATA_TYPE	VARCHAR(128)	The Vertica Analytic Database data type of this column

DATA_TYPE_ID	INTEGER	Numeric ID of the column's Vertica Analytic Database data type
DATA_TYPE_LENGTH	INTEGER	The number of bytes used to store this data type
CHARACTER_MAXIMUM_LENGTH	INTEGER	For string data types, the maximum number of characters it can hold
NUMERIC_PRECISION	INTEGER	For numeric types, the precision of the values in the column
NUMERIC_SCALE	INTEGER	For numeric data types, the scale of the values in the column
DATETIME_PRECISION	INTEGER	For datetime data types, the precision of the values in the column
INTERVAL_PRECISION	INTEGER	For interval data types, the precision of the values in the column
ORDINAL_POSITION	INTEGER	The position of the column within the table

Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

Notes

If you are using WebHCat instead of HiveServer2, querying this table results in one web service call to the WebHCat server for each table in each HCatalog schema. If you need to perform multiple queries on this table in a short period of time, consider creating a copy of the table using a CREATE TABLE AS statement to improve performance. The copy does not reflect any changes made to the schema of the Hive tables after it was created, but it is much faster to query.

Examples

The following example demonstrates finding the column information for a specific table:

```
=> SELECT * FROM HCATALOG_COLUMNS WHERE table_name = 'hcatalogtypes'
```

```
-> ORDER BY ordinal_position;
```

```
-[ RECORD 1 ]-----+-----
```

```
table_schema      | hcat
```

```
hcatalog_schema   | default
```

```
table_name        | hcatalogtypes
```

```

- [HCATALOG_TABLE_LIST](#)

HCATALOG_SCHEMATA

Lists all of the schemas defined using the HCatalog Connector. See [Using the HCatalog Connector](#).

Unlike other HCatalog Connector-related system tables, this table makes no calls to Hive, so querying incurs very little overhead.

Column Name	Data Type	Description
SCHEMA_ID	INTEGER	The Vertica Analytic Database ID number for the schema
SCHEMA_NAME	VARCHAR(128)	The name of the schema defined in the Vertica Analytic Database catalog
SCHEMA_OWNER_ID	INTEGER	The ID number of the user who owns the Vertica Analytic Database schema
SCHEMA_OWNER	VARCHAR(128)	The username of the Vertica Analytic Database schema's owner
CREATE_TIME	TIMESTAMPZ	The date and time the schema as created
HOSTNAME	VARCHAR(128)	The host name or IP address of the database server that holds the Hive metadata
PORT	INTEGER	The port number on which the metastore database listens for connections
HIVESERVER2_HOSTNAME	VARCHAR(128)	The host name or IP address of the HiveServer2 server for the Hive database
WEBSERVICE_HOSTNAME	VARCHAR(128)	The host name or IP address of the WebHCat server for the Hive database, if used
WEBSERVICE_PORT	INTEGER	The port number on which the WebHCat server listens for connections
WEBHDFS_ADDRESS	VARCHAR(128)	The host and port ("host:port") for the WebHDFS service, used for reading ORC and Parquet files
HCATALOG_SCHEMA_NAME	VARCHAR(128)	The name of the schema or database in Hive to which the Vertica Analytic Database schema is mapped/
HCATALOG_USER_NAME	VARCHAR(128)	The username the HCatalog Connector uses to authenticate itself to the Hive database.
HCATALOG_CONNECTION_TIMEOUT	INTEGER	The number of seconds the HCatalog Connector waits for a successful connection to the HiveServer or WebHCat server. A value of 0 means wait indefinitely.
HCATALOG_SLOW_TRANSFER_LIMIT	INTEGER	The lowest data transfer rate (in bytes per second) from the HiveServer2 or WebHCat server that the HCatalog Connector accepts.
HCATALOG_SLOW_TRANSFER_TIME	INTEGER	The number of seconds the HCatalog Connector waits before enforcing the data transfer rate lower limit by breaking the connection and terminating the query.
SSL_CONFIG	VARCHAR(128)	The path of the Hadoop ssl-client.xml configuration file, if using HiveServer2 with SSL wire encryption.
CUSTOM_PARTITIONS	BOOLEAN	Whether the Hive schema uses custom partition locations.

Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

See also

- [HCATALOG_COLUMNS](#)
- [HCATALOG_TABLE_LIST](#)
- [HCATALOG_TABLES](#)

HCATALOG_TABLE_LIST

A concise list of all tables contained in all Hive schemas and databases available through the HCatalog Connector. See [Using the HCatalog Connector](#).

Column Name	Data Type	Description
TABLE_SCHEMA_ID	INTEGER	Internal ID number for the schema containing the table
TABLE_SCHEMA	VARCHAR(128)	Name of the Vertica Analytic Database schema through which the table is available
HCATALOG_SCHEMA	VARCHAR(128)	Name of the Hive schema or database containing the table
TABLE_NAME	VARCHAR(128)	The name of the table
HCATALOG_USER_NAME	VARCHAR(128)	Name of Hive user used to access the table

Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

Notes

- Querying this table results in one call to HiveServer2 for each Hive schema defined using the HCatalog Connector. This means that the query usually takes longer than querying other system tables.
- Querying this table is faster than querying HCATALOG_TABLES. Querying HCATALOG_TABLE_LIST only makes one HiveServer2 call per HCatalog schema versus one call per table for HCATALOG_TABLES.

Examples

The following example demonstrates defining a new HCatalog schema then querying HCATALOG_TABLE_LIST. Note that one table defined in a different HCatalog schema also appears. HCATALOG_TABLE_LIST lists all of the tables available in any of the HCatalog schemas:

```
=> CREATE HCATALOG SCHEMA hcat WITH hostname='hcat'
-> HCATALOG_SCHEMA='default' HCATALOG_DB='default' HCATALOG_USER='hcatuser';
CREATE SCHEMA
=> \x
```

Expanded display is on.

```
=> SELECT * FROM v_catalog.hcatalog_table_list;
```

```
-[ RECORD 1 ]-----+-----
table_schema_id | 45035996273748980
table_schema    | hcat
hcatalog_schema | default
table_name      | weblogs
hcatalog_user_name | hcatuser
-[ RECORD 2 ]-----+-----
table_schema_id | 45035996273748980
table_schema    | hcat
hcatalog_schema | default
table_name      | tweets
hcatalog_user_name | hcatuser
-[ RECORD 3 ]-----+-----
table_schema_id | 45035996273748980
table_schema    | hcat
hcatalog_schema | default
table_name      | messages
hcatalog_user_name | hcatuser
-[ RECORD 4 ]-----+-----
table_schema_id | 45035996273864948
table_schema    | hiveschema
hcatalog_schema | default
table_name      | weblogs
hcatalog_user_name | hcatuser
```

HCATALOG_TABLES

Returns a detailed list of all tables made available through the HCatalog Connector. See [Using the HCatalog Connector](#).

Column Name	Data Type	Description
TABLE_SCHEMA_ID	INTEGER	ID number of the schema
TABLE_SCHEMA	VARCHAR(128)	The name of the Vertica Analytic Database schema through which the table is available
HCATALOG_SCHEMA	VARCHAR(128)	The name of the Hive schema or database that contains the table
TABLE_NAME	VARCHAR(128)	The name of the table
HCATALOG_USER_NAME	VARCHAR(128)	The name of the HCatalog user whose credentials are used to access the table's data
MIN_FILE_SIZE_BYTES	INTEGER	The file size of the table's smallest data file, if using WebHCat; null if using HiveServer2
TOTAL_NUMBER_FILES	INTEGER	The number of files used to store this table's data in HDFS
LOCATION	VARCHAR(8192)	The URI for the directory containing this table's data, normally an HDFS URI
LAST_UPDATE_TIME	TIMESTAMPZ	The last time data in this table was updated, if using WebHCat; null if using HiveServer2
OUTPUT_FORMAT	VARCHAR(128)	The Hive SerDe class used to output data from this table
LAST_ACCESS_TIME	TIMESTAMPZ	The last time data in this table was accessed, if using WebHCat; null if using HiveServer2
MAX_FILE_SIZE_BYTES	INTEGER	The size of the largest data file for this table, if using WebHCat; null if using HiveServer2
IS_PARTITIONED	BOOLEAN	Whether this table is partitioned
PARTITION_EXPRESSION	VARCHAR(128)	The expression used to partition this table
TABLE_OWNER	VARCHAR(128)	The Hive user that owns this table in the Hive database, if using WebHCat; null if using HiveServer2
INPUT_FORMAT	VARCHAR(128)	The SerDe class used to read the data from this table
TOTAL_FILE_SIZE_BYTES	INTEGER	Total number of bytes used by all of this table's data files
HCATALOG_GROUP	VARCHAR(128)	The permission group assigned to this table, if using WebHCat; null if using HiveServer2
PERMISSION	VARCHAR(128)	The Unix file permissions for this group, as shown by the <code>ls -l</code> command, if using WebHCat; null if using HiveServer2

Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

ICEBERG_COLUMNS

Provides column information for [Iceberg external tables](#). The information in this table is drawn from the Iceberg metadata files at query time.

Column Name	Data Type	Description
TABLE_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the table.
TABLE_SCHEMA	VARCHAR	Name of the table's schema. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
TABLE_NAME	VARCHAR	Name of the table containing the column.
COLUMN_ID	VARCHAR	Catalog-assigned VARCHAR value that uniquely identifies a table column.
COLUMN_NAME	VARCHAR	Name of the column.
DATA_TYPE	VARCHAR	Column data type.
DATA_TYPE_ID	INTEGER	Catalog-assigned unique numeric ID of the data type.
DATA_TYPE_LENGTH	INTEGER	Maximum allowable length of the data type.
CHARACTER_MAXIMUM_LENGTH	VARCHAR	Maximum allowable length of a VARCHAR column.
NUMERIC_PRECISION	INTEGER	Number of significant decimal digits for a NUMERIC column.
NUMERIC_SCALE	INTEGER	Number of fractional digits for a NUMERIC column.
DATETIME_PRECISION	INTEGER	Declared precision for a TIMESTAMP column, or NULL if no precision was declared.
INTERVAL_PRECISION	INTEGER	Number of fractional digits retained in the seconds field of an INTERVAL column.
IS_NULLABLE	BOOLEAN	Whether the column can contain NULL values.
WRITE_DEFAULT	VARCHAR	Field value for any records written after the field was added to the schema, if the writer does not supply the field's value.
INITIAL_DEFAULT	VARCHAR	Field value for all records that were written before the field was added to the schema.

INHERITED_PRIVILEGES

Provides summary information about [privileges inherited](#) by objects from GRANT statements on parent schemas, excluding inherited [grant options](#).

For information about explicitly granted permissions, see system table [GRANTS](#) .

Note

Inherited privileges are not displayed if privilege inheritance is disabled at the database level with [DisableInheritedPrivileges](#) .

Column Name	Data Type	Description
OBJECT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the object inheriting the privileges.
SCHEMA_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the parent schema.

OBJECT_NAMESPACE	VARCHAR	For Eon Mode databases, namespace of the table or view.
OBJECT_SCHEMA	VARCHAR	Name of the parent schema of a table or view. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
OBJECT_NAME	VARCHAR	Name of the table or view.
OBJECT_TYPE	VARCHAR	The object type, one of the following: <ul style="list-style-type: none"> • Table • View • Model
PRIVILEGES_DESCRIPTION	VARCHAR	Lists the privileges inherited on an object. An asterisk (*) appended to a privilege indicates that the user can grant the privilege to other users by granting the privilege on the parent schema.
PRINCIPAL	VARCHAR	Name of the role or user inheriting the privileges in the row.
PRINCIPAL_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the user inheriting the privileges.
GRANTOR	VARCHAR	User that granted the privileges on the parent schema to the principal.
GRANTOR_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the user who performed the grant operation.
GRANT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the grant operation.

Examples

The following query returns the privileges that the tables and views inherit from their parent schema, customers.

```

-> SELECT object_schema,object_name,object_type,privileges_description,principal,grantor FROM inherited_privileges WHERE object_schema='customers'
object_schema | object_name | object_type | privileges_description | principal | grantor
-----+-----+-----+-----+-----+-----
customers | cust_info | Table | INSERT, SELECT, UPDATE, DELETE, ALTER, REFERENCES, DROP, TRUNCATE | dbadmin | dbadmin
customers | shipping_info | Table | INSERT, SELECT, UPDATE, DELETE, ALTER, REFERENCES, DROP, TRUNCATE | dbadmin | dbadmin
customers | cust_set | View | SELECT, ALTER, DROP | dbadmin | dbadmin
customers | cust_info | Table | SELECT | Val | dbadmin
customers | shipping_info | Table | SELECT | Val | dbadmin
customers | cust_set | View | SELECT | Val | dbadmin
customers | sales_model | Model | USAGE, ALTER, DROP | Pooja | dbadmin
customers | shipping_info | Table | INSERT | Pooja | dbadmin
(8 rows)

```

INHERITING_OBJECTS

Provides information about the objects (table, view, or model) that inherit privileges from their parent schemas.

For information about the particular privileges inherited from schemas and their associated GRANT statements, see the [INHERITED_PRIVILEGES](#) table.

Column Name	Data Type	Description
OBJECT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the object inheriting the privileges.

SCHEMA_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the parent schema.
OBJECT_SCHEMA	VARCHAR	Name of the parent schema.
OBJECT_NAME	VARCHAR	Name of the object.
OBJECT_TYPE	VARCHAR	The object type, one of the following: <ul style="list-style-type: none"> • Table • View • Model

Examples

The following query returns the tables and views that inherit their privileges from their parent schema, customers.

```
=> SELECT * FROM inheriting_objects WHERE object_schema='customers';
  object_id | schema_id | object_schema | object_name | object_type
-----+-----+-----+-----+-----
45035996273980908 | 45035996273980902 | customers | cust_info | table
45035996273980984 | 45035996273980902 | customers | shipping_info | table
45035996273980980 | 45035996273980902 | customers | cust_set | view
45035996273980983 | 45035996273980901 | ml_models | clustering_model | model
(3 rows)
```

KEYWORDS

Identifies Vertica reserved and non-reserved keywords.

Column Name	Data Type	Description
KEYWORD	VARCHAR	Vertica-reserved or non-reserved keyword.
RESERVED	VARCHAR	Indicates whether a keyword is reserved or non-reserved: <ul style="list-style-type: none"> • R: reserved • N: non-reserved

Examples

The following query gets all reserved keywords that begin with B:

```
=> SELECT * FROM keywords WHERE reserved = 'R' AND keyword ilike 'B%';
 keyword | reserved
-----+-----
BETWEEN | R
BIGINT  | R
BINARY  | R
BIT     | R
BOOLEAN | R
BOTH    | R
(6 rows)
```

See also

- [Keywords](#)
- [LARGE_CLUSTER_CONFIGURATION_STATUS](#)

Shows the current cluster nodes and control node (spread hosts) designations in the Catalog so you can see if they match.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node in the cluster.
SPREAD_HOST_NAME	VARCHAR	The host name of the control node (the host that manages control message responsibilities)
CONTROL_NODE_NAME	VARCHAR	The name of the control node

See also

[Large Cluster](#)

LICENSE_AUDITS

Lists the results of Vertica's license automatic compliance audits. See [How Vertica Calculates Database Size](#).

Column Name	Data Type	Description
DATABASE_SIZE_BYTES	INTEGER	The estimated raw data size of the database
LICENSE_SIZE_BYTES	INTEGER	The licensed data allowance
USAGE_PERCENT	FLOAT	Percentage of the licensed allowance used
AUDIT_START_TIMESTAMP	TIMESTAMPTZ	When the audit started
AUDIT_END_TIMESTAMP	TIMESTAMPTZ	When the audit finished
CONFIDENCE_LEVEL_PERCENT	FLOAT	The confidence level of the size estimate
ERROR_TOLERANCE_PERCENT	FLOAT	The error tolerance used for the size estimate
USED_SAMPLING	BOOLEAN	Whether data was randomly sampled (if false, all of the data was analyzed)
CONFIDENCE_INTERVAL_LOWER_BOUND_BYTES	INTEGER	The lower bound of the data size estimate within the confidence level
CONFIDENCE_INTERVAL_UPPER_BOUND_BYTES	INTEGER	The upper bound of the data size estimate within the confidence level
SAMPLE_COUNT	INTEGER	The number of data samples used to generate the estimate
CELL_COUNT	INTEGER	The number of cells in the database
AUDITED_DATA	VARCHAR	The type of data audited, which includes regular (non-flex), flex, external, and total data

LICENSES

For all licenses, provides information on license types, the dates for which licenses are valid, and the limits the licenses impose.

Column Name	Data Type	Description
LICENSE_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the license.
NAME	VARCHAR	The license's name. (The license name in this column could be represented by a long license key.)

LICENSEE	VARCHAR	The entity to which the product is licensed.
START_DATE	VARCHAR	The start date for which the license is valid.
END_DATE	VARCHAR	The end date until which the license is valid (or "Perpetual" if the license has no expiration).
LICENSETYPE	VARCHAR	The type of the license (for example, Premium Edition).
PARENT	VARCHAR	The parent license (field is blank if there is no parent).
SIZE	VARCHAR	The size limit for data on the license.
IS_SIZE_LIMIT_ENFORCED	BOOLEAN	Indicates whether the license includes enforcement of data and node limits, where t is true and f is false.
NODE_RESTRICTION	VARCHAR	The node limit the license imposes.
CONFIGURED_ID	INTEGER	A long license key.

LOAD_BALANCE_GROUPS

Lists the objects contained by all load balance groups. Each row in this table represents a single object that is a member of a load balance group. If a load balance group does not contain any objects, it appears once in this table with its type column set to 'Empty Group.'

Column Name	Data Type	Description
NAME	VARCHAR	The name of the load balance group
POLICY	VARCHAR	The policy that sets how the group chooses the node for a connection. Contains one of the following: <ul style="list-style-type: none"> • ROUNDROBIN • RANDOM • NONE
FILTER	VARCHAR	The IP address range in CIDR format to select the members of a fault group that are included in the load balance group. This column only has a value if the TYPE column is 'Fault Group' or 'Subcluster.'
TYPE	VARCHAR	The type of object contained in the load balance group. Contains one of: <ul style="list-style-type: none"> • Fault Group • Subcluster • Network Address Group • Empty Group
OBJECT_NAME	VARCHAR	The name of the fault group or network address included in the load balance group. This column is NULL if the group contains no objects.

Examples

```
=> SELECT * FROM LOAD_BALANCE_GROUPS;
```

name	policy	filter	type	object_name
group_1	ROUNDROBIN		Network Address Group	node01
group_1	ROUNDROBIN		Network Address Group	node02
group_2	ROUNDROBIN		Empty Group	
group_all	ROUNDROBIN		Network Address Group	node01
group_all	ROUNDROBIN		Network Address Group	node02
group_all	ROUNDROBIN		Network Address Group	node03
group_fault_1	RANDOM	0.0.0.0/0	Fault Group	fault_1

(7 rows)

LOG_PARAMS

Provides summary information about changes to configuration parameters related to authentication and security run in your database.

Column Name	Data Type	Description
ISSUED_TIME	VARCHAR	The time at which the query was executed.
USER_NAME	VARCHAR	Name of the user who issued the query at the time Vertica recorded the session.
USER_ID	INTEGER	Numeric representation of the user who ran the query.
HOSTNAME	VARCHAR	The hostname, IP address, or URL of the database server.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
AUDIT_TYPE	VARCHAR	The type of operation for the audit, in this case, Parameter.
AUDIT_TAG_NAME	VARCHAR	The tag for the specific parameter.
REQUEST_TYPE	VARCHAR	The type of query request.
REQUEST_ID	INTEGER	Unique identifier of the query request in the user session.
SUBJECT	VARCHAR	The new value of the parameter.
REQUEST	VARCHAR	Lists the query request.
SUCCESS	VARCHAR	Indicates whether or not the operation was successful.
CATEGORY	VARCHAR	The audit parent category, such as Authentication.

Examples

The following example queries the LOG_PARAMS system table and shows only the most recent configuration parameter for this user under the Authentication category:

```
=> SELECT * FROM log_params limit 1;
```

```
-----  
issued_time | 2018-02-12 13:41:20.837452-05  
user_name   | dbadmin  
user_id     | 45035996273704962  
hostname    | ::1:50690  
session_id  | v_vmart_node0001-341751:0x13878  
audit_type  | Param  
audit_tag_name | SecurityAlgorithm  
request_type | UTILITY  
request_id  | 8  
subject     | MD5  
request     | select set_config_parameter('SecurityAlgorithm','MD5',null);  
success     | t  
category    | Authentication  
(1 row)
```

LOG_QUERIES

Provides summary information about some queries related to authentication and security run in your database.

Column Name	Data Type	Description
ISSUED_TIME	VARCHAR	The time at which the query was executed.
USER_NAME	VARCHAR	Name of the user who issued the query at the time Vertica recorded the session.
USER_ID	INTEGER	Numeric representation of the user who ran the query.
HOSTNAME	VARCHAR	The hostname, IP address, or URL of the database server.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
AUDIT_TYPE	VARCHAR	The type of operation for the audit, in this case, Query.
AUDIT_TAG_NAME	VARCHAR	The tag for the specific query.
REQUEST_TYPE	VARCHAR	The type of query request. Examples include, but are not limited to: <ul style="list-style-type: none">• QUERY• DDL• LOAD• UTILITY• TRANSACTION• PREPARE• EXECUTE• SET• SHOW
REQUEST_ID	INTEGER	The ID of the query request.
SUBJECT	VARCHAR	The subject of the query.
REQUEST	VARCHAR	Lists the query request.
SUCCESS	VARCHAR	Indicates whether or not the operation was successful.

CATEGORY	VARCHAR	The audit parent category, such as <code>Managing_Users_Privileges</code> .
----------	---------	---

Examples

The following example queries the `LOG_QUERIES` system table and shows only the most recent query for this user under the `Managing_Users_Privileges` category:

```
=> SELECT * FROM log_queries limit 1;
-----
issued_time | 2018-01-22 10:36:55.634349-05
user_name   | dbadmin
user_id     | 45035996273704962
hostname    |
session_id  | v_vmart_node0001-237210:0x37e1d
audit_type  | Query
audit_tag_name| REVOKE ROLE
request_type | DDL
request_id  | 2
subject     |
request     | revoke all privileges from Joe;
success     | f
category    | Managing_Users_Privileges
(1 row)
```

LOG_TABLES

Provides summary information about queries on system tables.

Column Name	Data Type	Description
ISSUED_TIME	VARCHAR	Time of query execution.
USER_NAME	VARCHAR	Name of user who issued the query at the time Vertica recorded the session.
USER_ID	INTEGER	Numeric representation of the user who ran the query.
HOSTNAME	VARCHAR	The hostname, IP address, or URL of the database server.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
AUDIT_TYPE	VARCHAR	The type of operation for the audit, in this case, Table.
AUDIT_TAG_NAME	VARCHAR	The tag for the specific table.
REQUEST_TYPE	VARCHAR	The type of query request. In this case, QUERY.
REQUEST_ID	INTEGER	Unique identifier of the query request in the user session.
SUBJECT	VARCHAR	The name of the table that was queried.
REQUEST	VARCHAR	Lists the query request.
SUCCESS	VARCHAR	Indicates whether or not the operation was successful.
CATEGORY	VARCHAR	The audit parent category—for example, Views , Security , and Managing_Users_Privileges .

Examples

The following example shows recent queries on configuration parameters:

```

dbadmin=> SELECT issued_time, audit_type, request_type, subject, request, category FROM log_tables
  WHERE category ilike '%Managing_Config_Parameters%' ORDER BY issued_time DESC LIMIT 4;
-[ RECORD 1 ]+-----
issued_time | 2020-05-14 14:14:53.453552-04
audit_type  | Table
request_type| QUERY
subject     | vs_nodes
request     | SELECT * from vs_nodes order by name limit 1;
category    | Managing_Config_Parameters
-[ RECORD 2 ]+-----
issued_time | 2020-05-14 14:14:27.546474-04

audit_type  | Table
request_type| QUERY
subject     | vs_nodes
request     | select * from configuration_parameters where parameter_name = 'MaxDepotSizePercent';
category    | Managing_Config_Parameters

```

MATERIALIZED_FLEXTABLE_COLUMNS_RESULTS

Contains the results of running the [MATERIALIZED_FLEXTABLE_COLUMNS](#) function. The table contains information about keys that the function evaluated. It does not contain information about all keys.

Column Name	Data Type	Description
TABLE_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the table.
TABLE_SCHEMA	VARCHAR	The schema name for which information is listed.
TABLE_NAME	VARCHAR	The table name for which information is listed.
CREATION_TIME	VARCHAR	Timestamp when the key was materialized.
KEY_NAME	VARCHAR	Name of the key from the VMap column that was materialized.
STATUS	VARCHAR	Status of the materialized column, one of the following: <ul style="list-style-type: none"> • ADDED • EXISTS • ERROR

MESSAGE	BOOLEAN	<p>Message associated with the status in the previous column, one of the following:</p> <ul style="list-style-type: none"> • Added successfully • Column of same name already exists in table definition • Add operation failed • No data type guess provided to add column
---------	---------	---

Examples

```
=> \x
Expanded display is on.
=> SELECT table_id, table_schema, table_name, key_name, status, message FROM MATERIALIZE_FLEXTABLE_COLUMNS_RESULTS
WHERE table_name = 'mountains_hybrid';
-[ RECORD 1 ]+-----
table_id | 45035996273708192
table_schema | public
table_name | mountains_hybrid
key_name | type
status | ADDED
message | Added successfully
-[ RECORD 2 ]+-----
table_id | 45035996273708192
table_schema | public
table_name | mountains_hybrid
key_name | height
status | ADDED
message | Added successfully
-[ RECORD 3 ]+-----
table_id | 45035996273708192
table_schema | public
table_name | mountains_hybrid
key_name | name
status | EXISTS
message | Column of same name already exists in table definition
```

MODELS

Lists details about the machine-learning models in the database.

Column Name	Data Type	Description
MODEL_ID	INTEGER	The model's internal ID.
MODEL_NAME	VARCHAR(128)	The name of the model.
SCHEMA_ID	INTEGER	The schema's internal ID.
SCHEMA_NAME	VARCHAR(128)	The name of the schema.
OWNER_ID	INTEGER	The model owner's ID.
OWNER_NAME	VARCHAR(128)	The user who created the model.
CATEGORY	VARCHAR(128)	The type of model. By default, models created in Vertica are assigned to the Vertica_Models category.
MODEL_TYPE	VARCHAR(128)	The type of algorithm used to create the model.

IS_COMPLETE	VARCHAR(128)	Denotes whether the model is complete and ready for use in machine learning functions. This field is usually false when the model is being trained. Once the training is complete, the field is set to true.
CREATE_TIME	TIMESTAMPTZ	The time the model was created.
SIZE	INTEGER	The size of the model in bytes.
IS_INHERIT_PRIVILEGES	BOOLEAN	Whether the model inherits the privileges of its parent schema.

Examples

```
=> SELECT * FROM models;
-[ RECORD 1 ]-----+-----
model_id      | 45035996273850350
model_name    | xgb_iris
schema_id     | 45035996273704984
schema_name   | public
owner_id      | 45035996273704962
owner_name    | dbadmin
category      | VERTICA_MODELS
model_type    | XGB_CLASSIFIER
is_complete   | t
create_time   | 2022-11-29 13:38:59.259531-05
size          | 11018
is_inherit_privileges | f
-[ RECORD 2 ]-----+-----
model_id      | 45035996273866816
model_name    | arima_weather
schema_id     | 45035996273704984
schema_name   | public
owner_id      | 45035996273704962
owner_name    | dbadmin
category      | VERTICA_MODELS
model_type    | ARIMA
is_complete   | t
create_time   | 2023-03-31 13:13:06.342661-05
size          | 2770
is_inherit_privileges | f
```

NAMESPACES

Lists details about the [namespaces](#) in an Eon Mode database.

Column Name	Data Type	Description
NAMESPACE_OID	INTEGER	Catalog-assigned numeric value that uniquely identifies the namespace.
NAMESPACE_NAME	VARCHAR	Name of the namespace
IS_DEFAULT	BOOLEAN	Whether the namespace is the default namespace of the database.
DEFAULT_SHARD_COUNT	VARCHAR	Shard count of the namespace.

Example

List the details of all namespaces in your database:

```

=> SELECT * FROM NAMESPACES;
 namespace_oid | namespace_name | is_default | default_shard_count
-----
45035996273704988 | default_namespace | t | 9
32582959204859183 | analytics | f | 12
(2 rows)

```

NETWORK_ADDRESSES

Lists information about the network addresses defined in your database using the [CREATE NETWORK ADDRESS](#) statement.

Column Name	Data Type	Description
NAME	VARCHAR	The name of the network address.
NODE	VARCHAR	The name of the node that owns the network address.
ADDRESS	VARCHAR	The network address's IP address. This address can be either in IPv4 or IPv6 format.
PORT	INT	The network address's port number.
ADDRESS_FAMILY	VARCHAR	The format of the network address's IP address. This values is either 'ipv4' or 'ipv6'.
IS_ENABLED	BOOLEAN	Whether the network address is enabled. You can disable network addresses to prevent their use. If the address is disabled, the value in this column is False.
IS_AUTO_DETECTED	BOOLEAN	Whether Vertica created the network address automatically.

Examples

```

=> \x
Expanded display is on.

=> SELECT * FROM v_catalog.network_addresses;
-[ RECORD 1 ]-----
name      | node01
node      | v_vmart_node0001
address   | 10.20.100.247
port      | 5433
address_family | ipv4
is_enabled | t
is_auto_detected | f
-[ RECORD 2 ]-----
name      | node02
node      | v_vmart_node0002
address   | 10.20.100.248
port      | 5433
address_family | ipv4
is_enabled | t
is_auto_detected | f
-[ RECORD 3 ]-----
name      | node03
node      | v_vmart_node0003

NODE_SUBSCRIPTION_CHANGE_PHASES

In an Eon Mode database, stores information about changes to node's shard subscriptions.

Column Name	Data Type	Description
node_name	VARCHAR	Name of the node
subscription_change_type	VARCHAR	The change being made to the subscription
session_id	INTEGER	ID of the session in which the change was initiated
transaction_id	INTEGER	ID of the transaction in which the change was initiated
user_id	INTEGER	ID of user that initiated the change
user_name	VARCHAR	Name of user that initiated the change
subscription_oid	INTEGER	Session object ID
subscriber_node_oid	INTEGER	Object ID of node that requested the subscription
subscriber_node_name	VARCHAR	Name of the node that requested the subscription
shard_oid	INTEGER	Object ID of the shard to which the node is subscribed
shard_name	VARCHAR	Name of the shard to which the node is subscribed
min_time	TIMESTAMPTZ	Start time of the subscription change
max_time	TIMESTAMPTZ	Completion time of the subscription change
source_node_oid	INTEGER	Object ID of the node from which catalog objects were fetched
source_node_name	VARCHAR	Name of the node from which catalog objects were fetched
num_objs_affected	INTEGER	Number of catalog objects affected by the subscription change
action	VARCHAR	Description of the action taken
new_content_size	INTEGER	Total size of the catalog objects that were fetched for the subscription change
phase_limit_reached	BOOLEAN	Reached maximum number of retries?
START_TIME	TIMESTAMPTZ	When the subscription change started
END_TIME	TIMESTAMPTZ	When the subscription change was finished
retried	BOOLEAN	Retry of subscription phase?
phase_result	VARCHAR	Outcome of the subscription change, one of the following: <ul style="list-style-type: none"> • Success • Failure

Examples

```
=> SELECT NODE_NAME, SUBSCRIPTION_CHANGE_TYPE, SHARD_NAME,
ACTION FROM node_subscription_change_phases
ORDER BY start_time ASC LIMIT 10;
```

NODE_NAME	SUBSCRIPTION_CHANGE_TYPE	SHARD_NAME	ACTION
v_verticadb_node0001	CREATE SUBSCRIPTION	segment0007	COLLECT SHARD METADATA
v_verticadb_node0001	CREATE SUBSCRIPTION	segment0010	COLLECT SHARD METADATA
v_verticadb_node0001	CREATE SUBSCRIPTION	segment0004	COLLECT SHARD METADATA
v_verticadb_node0001	CREATE SUBSCRIPTION	segment0005	COLLECT SHARD METADATA
v_verticadb_node0001	CREATE SUBSCRIPTION	replica	COLLECT SHARD METADATA
v_verticadb_node0001	CREATE SUBSCRIPTION	segment0005	COLLECT SHARD METADATA
v_verticadb_node0001	CREATE SUBSCRIPTION	segment0006	COLLECT SHARD METADATA
v_verticadb_node0001	CREATE SUBSCRIPTION	segment0008	COLLECT SHARD METADATA
v_verticadb_node0001	CREATE SUBSCRIPTION	segment0011	COLLECT SHARD METADATA
v_verticadb_node0001	CREATE SUBSCRIPTION	segment0002	COLLECT SHARD METADATA

NODE_SUBSCRIPTIONS

Eon Mode only

Lists information about database node subscriptions to shards.

Column Name	Data Type	Description
SUBSCRIPTION_OID	INTEGER	Subscription OID
NODE_OID	INTEGER	Subscribed node OID
NODE_NAME	VARCHAR	Name of the node
SHARD_OID	INTEGER	OID of the shard to which the node is subscribed
SHARD_NAME	VARCHAR	Name of the shard to which the node is subscribed
SUBSCRIPTION_STATE	VARCHAR	Node's current subscription state
FROM_VERSION	INTEGER	Deprecated
IS_PRIMARY	BOOLEAN	Specifies whether the node is currently the primary subscriber .
IS_RESUBSCRIBING	BOOLEAN	Indicates whether a subscription is resubscribing to a node: <ul style="list-style-type: none"> t (true): A subscription is resubscribing, only applies to PENDING subscriptions created during the cluster or node startup. f (false): A subscription is not resubscribing, applies to PENDING subscriptions created with REBALANCE_SHARDS that transitioned to an ACTIVE state.
CREATOR_TID	INTEGER	ID of transaction that created this subscription
SUBSCRIBED_TO_METADATA_AT	INTEGER	Deprecated
IS_PARTICIPATING_PRIMARY	BOOLEAN	Whether this node is the participating primary subscriber for the shard. If true, the node listed in NODE_NAME is the only one that reads from and writes to communal storage for this shard in the subcluster. Other nodes in the subcluster that subscribe to the same shard receive data from this node via peer-to-peer transfers.

Examples

The following example queries the NODE_SUBSCRIPTIONS table in a database with two three-node subclusters (a primary and a secondary) in a 12-shard database.

```
=> SELECT node_name, shard_name, subscription_state, is_primary,
       is_participating_primary AS is_p_primary
       FROM NODE_SUBSCRIPTIONS ORDER BY node_name, shard_name;
```

node_name	shard_name	subscription_state	is_primary	is_p_primary
v_verticadb_node0001	replica	ACTIVE	t	t
v_verticadb_node0001	segment0001	ACTIVE	t	t

(54 rows)

NODES

Lists details about the nodes in the database.

Column Name	Data Type	Description
NODE_NAME	VARCHAR(128)	The name of the node.
NODE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the node.
NODE_STATE	VARCHAR(128)	The node's current state, one of the following: <ul style="list-style-type: none"> • UP • DOWN • READY • UNSAFE • SHUTDOWN • SHUTDOWN_ERROR • RECOVERING • RECOVER_ERROR • RECOVERED • INITIALIZING • STANDBY • NEEDS_CATCHUP
IS_PRIMARY	BOOLEAN	Whether the node is a primary or secondary node. Primary nodes are the only ones Vertica considers when determining the K-Safety of an Eon Mode database. The node inherits this property from the subcluster that contains it.
IS_READONLY	BOOLEAN	Whether the node is in read-only mode or not. This column is TRUE if the Eon Mode database is read-only due to the loss of quorum or primary shard coverage . See Database Read-Only Mode .
NODE_ADDRESS	VARCHAR(80)	The host address of the node.
NODE_ADDRESS_FAMILY	VARCHAR(10)	The IP Version of the node_address . For example, ipv4 .
EXPORT_ADDRESS	VARCHAR(8192)	The IP address of the node (on the public network) used for import/export operations and native load-balancing.
EXPORT_ADDRESS_FAMILY	VARCHAR(10)	The IP Version of the export_address . For example, ipv4 .
CATALOG_PATH	VARCHAR(8192)	The absolute path to the catalog on the node.
NODE_TYPE	VARCHAR(9)	The type of the node. For more information on the types of nodes, refer to Setting node type .
IS_EPHEMERAL	BOOLEAN	(Deprecated) True if this node has been marked as ephemeral. (in preparation for removing it from the cluster).
STANDING_IN_FOR	VARCHAR(128)	The name of the node that this node is currently replacing.
SUBCLUSTER_NAME	VARCHAR(128)	In an Eon Mode database, the name of the subcluster that contains the node. Nodes belong to exactly one subcluster.
SANDBOX	VARCHAR(128)	In an Eon Mode database, the name, if any, of the sandbox to which the node belongs. NULL if the node is not a member of an active sandbox.
LAST_MSG_FROM_NODE_AT	TIMESTAMPZ	The date and time the last message was received from this node.

NODE_DOWN_SINCE	TIMESTAMPZ	The amount of time that the replaced node has been unavailable.
BUILD_INFO	VARCHAR(128)	The version of the Vertica server binary the node is running.

Example

```
=> SELECT NODE_NAME, NODE_STATE, IS_PRIMARY, IS_READONLY, NODE_TYPE,
       SUBCLUSTER_NAME FROM NODES ORDER BY NODE_NAME ASC;
  NODE_NAME | NODE_STATE | IS_PRIMARY | IS_READONLY | NODE_TYPE | SUBCLUSTER_NAME
-----+-----+-----+-----+-----+-----
v_verticadb_node0001 | UP        | t         | f          | PERMANENT | default_subcluster
v_verticadb_node0002 | UP        | t         | f          | PERMANENT | default_subcluster
v_verticadb_node0003 | UP        | t         | f          | PERMANENT | default_subcluster
v_verticadb_node0004 | UP        | f         | f          | PERMANENT | analytics
v_verticadb_node0005 | UP        | f         | f          | PERMANENT | analytics
v_verticadb_node0006 | UP        | f         | f          | PERMANENT | analytics
(6 rows)
```

ODBC_COLUMNS

Provides table column information. The format is defined by the ODBC standard for the ODBC SQLColumns metadata. Details on the ODBC SQLColumns format are available in the ODBC specification: <http://msdn.microsoft.com/en-us/library/windows/desktop/ms711683%28v=vs.85%29.aspx>.

Column Name	Data Type	Description
SCHEMA_NAME	VARCHAR	Name of the schema in which the column resides. If the column does not reside in a schema, this field is empty.
TABLE_NAME	VARCHAR	Name of the table in which the column resides.
COLUMN_NAME	VARCHAR	Name of the column.
DATA_TYPE	INTEGER	Data type of the column. This can be an ODBC SQL data type or a driver-specific SQL data type. This column corresponds to the ODBC_TYPE column in the TYPES table.
DATA_TYPE_NAME	VARCHAR	Driver-specific data type name.
COLUMN_SIZE	INTEGER	ODBC-defined data size of the column.
BUFFER_LENGTH	INTEGER	Transfer octet length of a column is the maximum number of bytes returned to the application when data is transferred to its default C data type. See http://msdn.microsoft.com/en-us/library/windows/desktop/ms713979%28v=vs.85%29.aspx
DECIMAL_DIGITS	INTEGER	Total number of significant digits to the right of the decimal point. This value has no meaning for non-decimal data types.
NUM_PREC_RADIX	INTEGER	Radix Vertica reports decimal_digits and columns_size as. This value is always 10, because it refers to a number of decimal digits, rather than a number of bits.
NULLABLE	BOOLEAN	Whether the column can contain null values.
REMARKS	VARCHAR	Textual remarks for the column.
COLUMN_DEFAULT	VARCHAR	Default value of the column.
SQL_TYPE_ID	INTEGER	SQL data type of the column.

SQL_DATETIME_SUB	VARCHAR	Subtype for a datetime data type. This value has no meaning for non-datetime data types.
CHAR_OCTET_LENGTH	INTEGER	Maximum length of a string or binary data column.
ORDINAL_POSITION	INTEGER	Position of the column in the table definition.
IS_NULLABLE	VARCHAR	Values can be YES or NO, determined by the value of the NULLABLE column.
IS_IDENTITY	BOOLEAN	Whether the column is an IDENTITY column.

PASSWORD_AUDITOR

Stores information about user accounts, account expirations, and [password hashing algorithms](#).

Column Name	Data Type	Description
USER_ID	INTEGER	Unique ID for the user.
USER_NAME	VARCHAR	Name of the user.
ACCTEXPIRED	BOOLEAN	Indicates if the user's password expires. 'f' indicates that it does not expire. 't' indicates that it does expire.
SECURITY_ALGORITHM	VARCHAR	User-level security algorithm for hash authentication. Valid values: <ul style="list-style-type: none"> 'NONE' (Default. Algorithm specified by SYSTEM_SECURITY_ALGORITHM is used.) 'SHA512' 'MD5'
SYSTEM_SECURITY_ALGORITHM	VARCHAR	System-level security algorithm for hash authentication. Valid values: <ul style="list-style-type: none"> 'SHA512' (Default) 'MD5'
EFFECTIVE_SECURITY_ALGORITHM	VARCHAR	The resulting security algorithm, depending on the values of SECURITY_ALGORITHM and SYSTEM_SECURITY_ALGORITHM. For details, see Password hashing algorithm .
CURRENT_SECURITY_ALGORITHM	VARCHAR	The security algorithm used to hash the user's current password. This can differ from the EFFECTIVE_SECURITY_ALGORITHM if a user hasn't reset their password since a change in the EFFECTIVE_SECURITY_ALGORITHM. Valid values: <ul style="list-style-type: none"> 'NONE' (Default. Algorithm specified by SYSTEM_SECURITY_ALGORITHM is used.) 'SHA512' 'MD5'

PASSWORDS

Contains information on current user passwords. This table also includes information on past passwords if any [Profiles](#) have [PASSWORD_REUSE_TIME](#) or [PASSWORD_REUSE_MAX](#) parameters set. See [CREATE PROFILE](#) for details.

Column Name	Data Type	Description
USER_ID	INTEGER	The ID of the user who owns the password.
USER_NAME	VARCHAR	The name of the user who owns the password.
PASSWORD	VARCHAR	The hashed password.
PASSWORD_CREATE_TIME	DATETIME	The date and time when the password was created.
IS_CURRENT_PASSWORD	BOOLEAN	Denotes whether this is the user's current password. Non-current passwords are retained to enforce password reuse limitations.
PROFILE_ID	INTEGER	The ID number of the profile to which the user is assigned.
PROFILE_NAME	VARCHAR	The name of the profile to which the user is assigned.
PASSWORD_REUSE_MAX	VARCHAR	The number password changes that must take place before an old password can be reused.
PASSWORD_REUSE_TIME	VARCHAR	The amount of time that must pass before an old password can be reused.
SALT	VARCHAR	A hex string used to hash the password.

Examples

The following query returns the SHA-512 hashed password and salt of user 'u1'.

```
=> SELECT user_name, password, salt FROM passwords WHERE user_name='u1';
user_name |          password          |          salt
-----+-----+-----
u1        | sha512f3f802f1c56e2530cd9c3164cc7b8002ba444c0834160f10 | f05e9d859fb441f9f612f8a787bfc872
(1 row)
```

PRIMARY_KEYS

Provides primary key information.

Column Name	Data Type	Description
CONSTRAINT_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the constraint.
CONSTRAINT_NAME	VARCHAR	The constraint name for which information is listed.
COLUMN_NAME	VARCHAR	The column name for which information is listed.
ORDINAL_POSITION	VARCHAR	The position of the column within the key. The numbering of columns starts at 1.
TABLE_NAME	VARCHAR	The table name for which information is listed.
CONSTRAINT_TYPE	VARCHAR	The constraint type, p , for primary key.
IS_ENABLED`	BOOLEAN	Indicates if a table column constraint for a PRIMARY KEY is enabled by default. Can be t (True) or f (False).
TABLE_NAMESPACE_ID	VARCHAR	For Eon Mode databases, unique numeric identifier of the namespace that contains the table.
TABLE_NAMESPACE	VARCHAR	For Eon Mode databases, name of the namespace that contains the table.

TABLE_SCHEMA	VARCHAR	The schema name for which information is listed. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
---------------------	---------	---

PROFILE_PARAMETERS

Defines what information is stored in profiles.

Column Name	Data Type	Description
PROFILE_ID	INTEGER	The ID of the profile to which this parameter belongs.
PROFILE_NAME	VARCHAR	The name of the profile to which this parameter belongs.
PARAMETER_TYPE	VARCHAR	The policy type of this parameter (password_complexity , password_security , etc.)
PARAMETER_NAME	VARCHAR	The name of the parameter.
PARAMETER_LIMIT	VARCHAR	The parameter's value.

PROFILES

Provides information about password policies that you set using the [CREATE PROFILE](#) statement.

Column Name	Data Type	Description
PROFILE_ID	INTEGER	Unique identifier for the profile.
PROFILE_NAME	VARCHAR	Profile name.
PASSWORD_LIFE_TIME	VARCHAR	Number of days before the user's password expires. After expiration, the user is forced to change passwords during login or warned that their password has expired if password_grace_time is set to a value other than zero or unlimited.
PASSWORD_MIN_LIFE_TIME	VARCHAR	The number of days a password must be set before it can be reset.
PASSWORD_MIN_CHAR_CHANGE	VARCHAR	The minimum number of characters that must be different from the previous password when performing a password reset.
PASSWORD_GRACE_TIME	VARCHAR	Number of days users are allowed to log in after their passwords expire. During the grace time, users are warned about their expired passwords when they log in. After the grace period, the user is forced to change passwords if he or she hasn't already.
PASSWORD_REUSE_MAX	VARCHAR	Number of password changes that must occur before the current password can be reused.
PASSWORD_REUSE_TIME	VARCHAR	Number of days that must pass after setting a password before it can be used again.
FAILED_LOGIN_ATTEMPTS	VARCHAR	Number of consecutive failed login attempts that triggers Vertica to lock the account.
PASSWORD_LOCK_TIME	VARCHAR	Number of days an account is locked after being locked due to too many failed login attempts.
PASSWORD_MAX_LENGTH	VARCHAR	Maximum number of characters allowed in a password.

PASSWORD_MIN_LENGTH	VARCHAR	Minimum number of characters required in a password.
PASSWORD_MIN_LETTERS	VARCHAR	The minimum number of letters (either uppercase or lowercase) required in a password.
PASSWORD_MIN_LOWERCASE_LETTERS	VARCHAR	The minimum number of lowercase.
PASSWORD_MIN_UPPERCASE_LETTERS	VARCHAR	The minimum number of uppercase letters required in a password.
PASSWORD_MIN_DIGITS	VARCHAR	The minimum number of digits required in a password.
PASSWORD_MIN_SYMBOLS	VARCHAR	The minimum of symbols (for example, !, #, \$, etc.) required in a password.

Notes

Non-superusers querying this table see only the information for the profile to which they are assigned.

- [ALTER PROFILE](#)

PROJECTION_CHECKPOINT_EPOCHS

Provides details on checkpoint epochs, applies only to Enterprise Mode.

Column Name	Data Type	Description
NODE_ID	INTEGER	Unique numeric identifier of this projection's node.
NODE_NAME	VARCHAR	Name of this projection's node.
PROJECTION_SCHEMA_ID	INTEGER	Unique numeric identifier of the projection schema.
PROJECTION_SCHEMA	VARCHAR	Name of the projection schema.
PROJECTION_ID	INTEGER	Unique numeric identifier of this projection.
PROJECTION_NAME	VARCHAR	Name of this projection.
IS_UP_TO_DATE	BOOLEAN	Specifies whether the projection is up to date and available to participate in query execution.
CHECKPOINT_EPOCH	INTEGER	Checkpoint epoch of the projection on the corresponding node. Data up to and including this epoch is in persistent storage, and can be recovered in the event of node failure.
WOULD_RECOVER	BOOLEAN	Determines whether data up to and including CHECKPOINT_EPOCH can be used to recover from an unclean shutdown : <ul style="list-style-type: none"> • t: CHECKPOINT_EPOCH is less than the cluster's Last Good Epoch, so data up to and including this epoch can be used during recovery. • f: Vertica must use Last Good Epoch to recover data for this projection. See also: GET_LAST_GOOD_EPOCH
IS_BEHIND_AHM	BOOLEAN	Specifies whether CHECKPOINT_EPOCH is less than the AHM (ancient history mark). If set to t (true), data for this projection cannot be rolled back. <p>See also: GET_AHM_EPOCH</p>

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

Examples

```
=> SELECT node_name, projection_schema, projection_name, is_up_to_date, checkpoint_epoch FROM projection_checkpoint_epochs
WHERE projection_name ilike 't1_b%' ORDER BY projection_name, node_name;

PROJECTION_COLUMNS

Provides information about projection columns, such as encoding type, sort order, type of statistics, and the time at which columns statistics were last updated.

Column Name	Data Type	Description
PROJECTION_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the projection.
PROJECTION_NAME	VARCHAR	The projection name for which information is listed.
PROJECTION_COLUMN_NAME	VARCHAR	The projection column name.
COLUMN_POSITION	INTEGER	The ordinal position of a projection's column used in the CREATE PROJECTION statement.
SORT_POSITION	INTEGER	The projection's column sort specification, as specified in CREATE PROJECTION .. ORDER BY clause. If the column is not included in the projection's sort order, SORT_POSITION output is NULL.
COLUMN_ID	INTEGER	A unique numeric object ID (OID) that identifies the associated projection column object and is assigned by the Vertica catalog. This field is helpful as a key to other system tables.

DATA_TYPE	VARCHAR	Matches the corresponding table column data type (see V_CATALOG.COLUMNS). DATA_TYPE is provided as a complement to ENCODING_TYPE .
ENCODING_TYPE	VARCHAR	The encoding type defined on the projection column.
ACCESS_RANK	INTEGER	The access rank of the projection column. See the ACCESSRANK parameter in the CREATE PROJECTION statement for more information.
GROUP_ID	INTEGER	A unique numeric ID (OID) that identifies the group and is assigned by the Vertica catalog.
TABLE_NAMESPACE	VARCHAR	For Eon Mode databases, name of the namespace that contains the projection.
TABLE_SCHEMA	VARCHAR	The name of the schema in which the projection is stored. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <code>n1.s</code> refers to schema <code>s</code> in namespace <code>n1</code> .
TABLE_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the table.
TABLE_NAME	VARCHAR	The table name that contains the projection.
TABLE_COLUMN_ID	VARCHAR	Catalog-assigned VARCHAR value that uniquely identifies a table column.
TABLE_COLUMN_NAME	VARCHAR	The projection's corresponding table column name.
STATISTICS_TYPE	VARCHAR	The type of statistics the column contains: <ul style="list-style-type: none"> • NONE : No statistics • ROWCOUNT : Set by ANALYZE_ROW_COUNT • FULL : Set by running ANALYZE_STATISTICS
STATISTICS_UPDATED_TIMESTAMP	TIMESTAMPTZ	The time at which the columns statistics were last updated by ANALYZE_STATISTICS . By querying this column, along with STATISTICS_TYPE and PROJECTION_COLUMN_NAME , you can identify projection columns whose statistics need updating. See also system table PROJECTIONS .
IS_EXPRESSION	BOOLEAN	Indicates whether this projection column is calculated with an expression. For aggregate columns, IS_EXPRESSION is always true.
IS_AGGREGATE	BOOLEAN	Indicates whether the column is an aggregated column in a live aggregate projection. IS_AGGREGATE is always false for Top-K projection columns.
PARTITION_BY_POSITION	INTEGER	Position of that column in the PARTITION BY and GROUP BY clauses, if applicable.
ORDER_BY_POSITION	INTEGER	Set only for Top-K projections , specifies the column's position in the ORDER BY clause, as defined in the projection definition's window partition clause . If the column is omitted from the ORDER BY clause, ORDER_BY_POSITION output is NULL.
ORDER_BY_TYPE	INTEGER	Type of sort order: <ul style="list-style-type: none"> • ASC NULLS FIRST • ASC NULLS LAST • DESC NULLS FIRST • DESC NULLS LAST

COLUMN_EXPRESSION	VARCHAR	Expression that calculates the column value.
--------------------------	----------------	--

Examples

See [Statistics Data in PROJECTION_COLUMNS](#)

PROJECTION_DELETE_CONCERNS

Lists projections whose design are liable to cause performance issues when deleting data. This table is generated by calling the [EVALUATE_DELETE_PERFORMANCE](#) function. See [Optimizing DELETE and UPDATE](#) for more information.

Column Name	Data Type	Description
PROJECTION_ID	INTEGER	The ID number of the projection
PROJECTION_SCHEMA	VARCHAR	The schema containing the projection
PROJECTION_NAME	VARCHAR	The projection's name
CREATION_TIME	TIMESTAMPZ	When the projection was created
LAST_MODIFIED_TIME	TIMESTAMPZ	When the projection was last modified
COMMENT	VARCHAR	A comment describing the potential delete performance issue.

PROJECTIONS

Provides information about projections.

Column Name	Data Type	Description
PROJECTION_SCHEMA_ID	INTEGER	A unique numeric ID that identifies the specific schema that contains the projection and is assigned by the Vertica catalog.
PROJECTION_SCHEMA	VARCHAR	The name of the schema that contains the projection. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
PROJECTION_NAMESPACE_NAME	VARCHAR	For Eon Mode databases, name of the namespace that contains the projection.
PROJECTION_ID	INTEGER	A unique numeric ID that identifies the projection and is assigned by the Vertica catalog.
PROJECTION_NAME	VARCHAR	The projection name for which information is listed.
PROJECTION_BASENAME	VARCHAR	The base name used for other projections: <ul style="list-style-type: none"> • For auto-created projections, identical to ANCHOR_TABLE_NAME. • For a manually-created projection, the name specified in the CREATE PROJECTION statement.

OWNER_ID	INTEGER	A unique numeric ID that identifies the projection owner and is assigned by the Vertica catalog.
OWNER_NAME	VARCHAR	The name of the projection's owner.
ANCHOR_TABLE_ID	INTEGER	The unique numeric identification (OID) of the projection's anchor table.
ANCHOR_TABLE_NAME	VARCHAR	The name of the projection's anchor table.
NODE_ID	INTEGER	A unique numeric ID (OID) for any nodes that contain any unsegmented projections.
NODE_NAME	VARCHAR	The names of any nodes that contain the projection. This column returns information for unsegmented projections only.
IS_PREJOIN	BOOLEAN	Deprecated, always set to f (false).
CREATED_EPOCH	INTEGER	The epoch in which the projection was created.
CREATE_TYPE	VARCHAR	<p>The method in which the projection was created:</p> <ul style="list-style-type: none"> • CREATE PROJECTION : A custom projection created using CREATE PROJECTION. • CREATE TABLE : A superprojection that was automatically created when its associated table was created using CREATE TABLE. • ALTER TABLE : The system automatically created the key projection in response to a non-empty table. • CREATE TABLE WITH PROJ CLAUSE : A superprojection that was automatically created using CREATE TABLE. • DELAYED_CREATION : A superprojection that was automatically created when data was loaded for the first time into a new table. • DESIGNER : A projection created by Database Designer. • SYSTEM TABLE : A projection that was automatically created for a system table. <p>Rebalancing does not change the CREATE_TYPE value for a projection.</p>
VERIFIED_FAULT_TOLERANCE	INTEGER	The projection K-safe value. This value can be greater than the database K-safety value (if more replications of a projection exist than are required to meet the database K-safety). This value cannot be less than the database K-safe setting.
IS_UP_TO_DATE	BOOLEAN	Specifies whether projection data is up to date . Only up-to-date projections are available to participate in query execution.
HAS_STATISTICS	BOOLEAN	<p>Specifies whether there are statistics for any column in the projection. HAS_STATISTICS returns true only when all non-epoch columns for a table or table partition have full statistics. For details, see Collecting table statistics and Collecting partition statistics.</p> <div style="background-color: #e6f2ff; padding: 10px; border: 1px solid #d9e1f2;"> <p>Note Projections that have no data never have full statistics. Query system table PROJECTION_STORAGE to determine whether your projection contains data.</p> </div>
IS_SEGMENTED	BOOLEAN	Specifies whether the projection is segmented.

SEGMENT_EXPRESSION	VARCHAR	The segmentation expression used for the projection. In the following example for the <code>clicks_agg</code> projection, the following values: <code>hash(clicks.user_id, (clicks.click_time)::date)</code> indicate that the projection was created with the following expression: <code>SEGMENTED BY HASH(clicks.user_id, (clicks.click_time)::date)</code>
SEGMENT_RANGE	VARCHAR	The percentage of projection data stored on each node, according to the segmentation expression. For example, segmenting a projection by the <code>HASH</code> function on all nodes results in a <code>SEGMENT_RANGE</code> value such as the following: <code>implicit range: node01[33.3%] node02[33.3%] node03[33.3%]</code>
IS_SUPER_PROJECTION	BOOLEAN	Specifies whether a projection is a superprojection.
IS_KEY_CONSTRAINT_PROJECTION	BOOLEAN	Indicates whether a projection is a key constraint projection: <ul style="list-style-type: none"> <code>t</code>: A key constraint projection that validates a key constraint. Vertica uses the projection to efficiently enforce at least one enabled key constraint. <code>f</code>: Not a projection that validates a key constraint.
HAS_EXPRESSIONS	BOOLEAN	Specifies whether this projection has expressions that define the column values. <code>HAS_EXPRESSIONS</code> is always true for live aggregate projections.
IS_AGGREGATE_PROJECTION	BOOLEAN	Specifies whether this projection is a live aggregate projection.
AGGREGATE_TYPE	VARCHAR	Specifies the type of live aggregate projection: <ul style="list-style-type: none"> <code>GROUPBY</code> <code>TOPK</code>
IS_SHARED	BOOLEAN	Indicates whether the projection is located on shared storage.
PARTITION_RANGE_MIN	VARCHAR	Populated only if a projection specifies a <code>partition range</code> , the lowest and highest partition keys of the range.
PARTITION_RANGE_MAX		
PARTITION_RANGE_MIN_EXPRESSION	VARCHAR	Populated only if a projection specifies <code>partition range</code> , the minimum and maximum range expressions as defined in the projection DDL.
PARTITION_RANGE_MAX_EXPRESSION		

Examples

The following projection defines a range of orders placed since the first of the current year:

```
-> CREATE PROJECTION ytd_orders AS SELECT * FROM store_orders ORDER BY order_date
ON PARTITION RANGE BETWEEN date_trunc('year',now()):date AND NULL;
```

Given that range, the `PARTITION_RANGE_MIN` and `PARTITION_RANGE_MAX` columns in the PROJECTIONS table contain the following values:

```
-> SELECT projection_name partition_range_min, partition_range_min, partition_range_max
FROM projections WHERE projection_name ILIKE 'ytd_orders%';
partition_range_min | partition_range_min | partition_range_max
-----
ytd_orders_b1      | 2024-01-01         | infinity
ytd_orders_b0      | 2024-01-01         | infinity
(2 rows)
```

The following projection defines a range of orders placed since the third quarter of last year:

```
-> CREATE PROJECTION q3_id AS SELECT * FROM store_orders ORDER BY order_date
   ON PARTITION RANGE BETWEEN add_months(date_trunc('year', now()), -3)::date AND NULL;
```

Given that definition, the **PARTITION_RANGE_MIN_EXPRESSION** and **PARTITION_RANGE_MAX_EXPRESSION** columns in the PROJECTIONS table contain the following values:

```
-> SELECT projection_name, partition_range_min_expression, partition_range_max_expression
   FROM projections WHERE projection_name ILIKE 'Q3_id%';
projection_name | partition_range_min_expression | partition_range_max_expression
-----
q3_id_b1       | add_months(date_trunc('year', now()), (-3)) | NULL
q3_id_b0       | add_months(date_trunc('year', now()), (-3)) | NULL
```

See also

[PROJECTION_COLUMNS](#)

[REGISTERED_MODELS](#)

Lists details about registered machine learning models in the database. The table lists only registered models for which the caller has USAGE privileges.

For a table that lists all models, registered and unregistered, see [MODELS](#).

Column Name	Data Type	Description
REGISTERED_NAME	VARCHAR	The abstract name to which the model is registered. This REGISTERED_NAME can represent a group of models for a higher-level application, where each model in the group has a unique version number.
REGISTERED_VERSION	INTEGER	The unique version number of the model under its specified REGISTERED_NAME .
STATUS	INTEGER	The status of the registered model, one of the following: <ul style="list-style-type: none"> under_review : Status assigned to newly registered models. staging : Model is targeted for A/B testing against the model currently in production. production : Model is in production for its specified application. Only one model can be in production for a given <i>registered_name</i> at one time. archived : Status of models that were previously in production. Archived models can be returned to production at any time. declined : Model is no longer in consideration for production. unregistered : Model is removed from the versioning environment. The model does not appear in the REGISTERED_MODELS system table.
REGISTERED_TIME	VARCHAR	The time at which the model was registered.
MODEL_ID	INTEGER	The model's internal ID.
SCHEMA_NAME	VARCHAR	The name of the schema that contains the model.
MODEL_NAME	VARCHAR	The name of the model. [<i>schema_name.</i>] <i>model_name</i> can be used to uniquely identify a model, as can the combination of its REGISTERED_NAME and REGISTERED_VERSION .
MODEL_TYPE	VARCHAR	The type of algorithm used to create the model.

CATEGORY	VARCHAR	<p>The category of the model, one of the following:</p> <ul style="list-style-type: none"> • VERTICA_MODELS • PMML • TENSORFLOW <p>By default, models created in Vertica are assigned to the VERTICA_MODELS category.</p>
-----------------	---------	--

Example

If a user with the [MLSUPERVISOR](#) role queries REGISTERED_MODELS, all registered models are listed:

```
=> SELECT * FROM REGISTERED_MODELS;
 registered_name | registered_version | status | registered_time | model_id | schema_name | model_name | model_type |
category
-----+-----+-----+-----+-----+-----+-----+-----

RESOURCE_POOL_DEFAULTS

Returns default parameter settings for built-in and user-defined resource pools. Use [ALTER RESOURCE POOL](#) to restore resource pool parameters to their default settings.

For information about valid parameters for built-in resource pools and their default settings, see [Built-in resource pools configuration](#).

To obtain a resource pool's current settings, query system table [RESOURCE_POOLS](#).

Privileges

None

RESOURCE_POOLS

Displays settings for [built-in](#) and user-defined resource pools. For information about defining resource pools, see [CREATE RESOURCE POOL](#) and [ALTER RESOURCE POOL](#).

Column Name	Data Type	Description
POOL_ID	INTEGER	Unique identifier for the resource pool
NAME	VARCHAR	The name of the resource pool.
SUBCLUSTER_OID	INTEGER	Unique identifier for a subcluster-specific resource pool. For global resource pools, 0 is returned.

SUBCLUSTER_NAME	VARCHAR	Specifies the subcluster that the subcluster-specific resource pool belongs to. If there are subcluster-specific resource pools with the same name on separate subclusters, multiple entries are returned. For global resource pools, this column is blank.
IS_INTERNAL	BOOLEAN	Specifies whether this pool is a built-in pool .
MEMORYSIZE	VARCHAR	The amount of memory allocated to this resource pool.
MAXMEMORYSIZE	VARCHAR	Value assigned as the maximum size this resource pool can grow by borrowing memory from the GENERAL pool.
MAXQUERYMEMORYSIZE	VARCHAR	The maximum amount of memory allocated by this pool to process any query.
EXECUTIONPARALLELISM	INTEGER	Limits the number of threads used to process any single query issued in this resource pool.
PRIORITY	INTEGER	Specifies priority of queries in this pool when they compete for resources in the GENERAL pool.
RUNTIMEPRIORITY	VARCHAR	The run-time priority defined for this pool, indicates how many run-time resources (CPU, I/O bandwidth) the Resource Manager should dedicate to running queries in the resource pool. Valid values are: <ul style="list-style-type: none"> • HIGH • MEDIUM (default) • LOW These values are relative to each other. Queries with a HIGH run-time priority are given more CPU and I/O resources than those with a MEDIUM or LOW run-time priority.
RUNTIMEPRIORITYTHRESHOLD	INTEGER	Limits in seconds how soon a query must finish before the Resource Manager assigns to it the resource pool's RUNTIMEPRIORITY setting.
QUEUETIMEOUT	INTEGER INTERVAL	The maximum length of time requests can wait for resources to become available before being rejected, specified in seconds or as an interval . This value is set by the pool's QUEUETIMEOUT parameter.
PLANNEDCONCURRENCY	INTEGER	The preferred number of queries that execute concurrently in this resource pool, specified by the pool's PLANNEDCONCURRENCY parameter.
MAXCONCURRENCY	INTEGER	The maximum number of concurrent execution slots available to the resource pool, specified by the pool MAXCONCURRENCY parameter.
RUNTIMECAP	INTERVAL	The maximum time a query in the pool can execute.
SINGLEINITIATOR	BOOLEAN	Set for backward compatibility.
CPUAFFINITYSET	VARCHAR	The set of CPUs on which queries associated with this pool are executed. For example: <ul style="list-style-type: none"> • 0, 2-4 : Specifies CPUs 0, 2, 3, and 4 • 25% : A percentage of available CPUs, rounded down to whole CPUs.

CPUAFFINITYMODE	VARCHAR	Specifies whether to share usage of the CPUs assigned to this resource pool by CPUAFFINITYSET , one of the following: <ul style="list-style-type: none"> • SHARED : Queries that run in this pool share its CPUAFFINITYSET CPUs with other Vertica resource pools. • EXCLUSIVE : Dedicates CPUAFFINITYSET CPUs to this resource pool only, and excludes other Vertica resource pools. If CPUAFFINITYSET is set as a percentage, then that percentage of CPU resources available to Vertica is assigned solely for this resource pool. • ANY : Queries in this resource pool can run on any CPU.
CASCADETO	VARCHAR	A secondary resource pool for executing queries that exceed the RUNTIMECAP setting of this resource pool.
CASCADESUBCLUSTERPOOL	BOOLEAN	Specifies whether this resource pool cascades to a subcluster-level resource pool.

ROLES

Contains the names of all roles the user can access, along with any roles that have been assigned to those roles.

Tip

You can also use the function [HAS_ROLE](#) to see if a role is available to a user.

Column Name	Data Type	Description
ASSIGNED_ROLES	VARCHAR	The names of any roles that have been granted to this role. By enabling the role, the user also has access to the privileges of these additional roles. <div style="background-color: #e6f2ff; padding: 10px; margin-top: 10px;"> <p>Note An asterisk (*) appended to a role in this column indicates that the user can grant the role to other users.</p> </div>
NAME	VARCHAR	The name of a role that the user can access.
ROLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the role.
LDAP_DN	VARCHAR	Indicates whether or not the Vertica Analytic Database role maps to an LDAP Link group. When the column is set to dn , the Vertica role maps to LDAP Link.
LDAP_URI_HASH	VARCHAR	The URI hash number for the LDAP role.
IS_ORPHANED_FROM_LDAP	VARCHAR	Indicates if the role is disconnected (orphaned) from LDAP, valid values are: <ul style="list-style-type: none"> t - role is orphaned f - role is not orphaned For more information see Troubleshooting LDAP link issues

See also

- [GRANTS](#)

ROUTING_RULES

Lists the routing rules that map incoming IP addresses to a load balancing group.

Column Name	Data Type	Description
NAME	VARCHAR	The name of the routing rule.
SOURCE_ADDRESS	VARCHAR	The IP address range in CIDR format that this rule applies to.
DESTINATION_NAME	VARCHAR	The load balance group that handles connections for this rule.

Examples

```
=> SELECT * FROM routing_rules;
-[ RECORD 1 ]-----+-----
name          | internal_clients
source_address | 192.168.1.0/24
destination_name | group_1
-[ RECORD 2 ]-----+-----
name          | etl_rule
source_address | 10.20.100.0/24
destination_name | group_2
-[ RECORD 3 ]-----+-----
name          | subnet_192
source_address | 192.0.0.0/8
destination_name | group_all
-[ RECORD 4 ]-----+-----
name          | all_ipv6
source_address | 0::0/0
destination_name | default_ipv6
```

See also

SCHEDULER_TIME_TABLE

Contains information about [scheduled tasks](#).

This table is local to the active scheduler node (ASN) and is only populated when queried from that node. To get the ASN, use [ACTIVE_SCHEDULER_NODE](#):

```
=> SELECT active_scheduler_node();
active_scheduler_node
-----
initiator
(1 row)
```

Column Name	Data Type	Description
SCHEDULE_NAME	VARCHAR	The name of the schedule.
SCHEMA_NAME	VARCHAR	The schedule's schema.
OWNER	VARCHAR	The owner of the schedule.
ATTACHED_TRIGGER	VARCHAR	The trigger attached to the schedule . For details, see Scheduled execution .
ENABLED	BOOLEAN	Whether the schedule is enabled.

DATE_TIME_TYPE	VARCHAR	The format for the scheduled event, one of the following: <ul style="list-style-type: none"> • CRON • DATE_TIME_LIST
DATE_TIME_STRING	VARCHAR	The string used to schedule the event, one of the following: <ul style="list-style-type: none"> • A cron expression • A comma-separated list of timestamps

Examples

To view scheduled tasks, execute the following statement on the ASN:

```
=> SELECT * FROM scheduler_time_table;
schedule_name | attached_trigger | scheduled_execution_time
-----+-----+-----
daily_1am | log_user_actions | 2022-06-01 01:00:00-00
logging_2022 | refresh_logs | 2022-06-01 12:00:00-00
```

SCHEMATA

Provides information about schemas in the database.

Column Name	Data Type	Description
SCHEMA_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the specific schema.
SCHEMA_NAME	VARCHAR	Schema name for which information is listed. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
SCHEMA_NAMESPACE_NAME	VARCHAR	For Eon Mode databases, name of the namespace that contains the schema.
SCHEMA_OWNER_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the owner who created the schema.
SCHEMA_OWNER	VARCHAR	Name of the owner who created the schema.
SYSTEM_SCHEMA_CREATOR	VARCHAR	Creator information for system schema or NULL for non-system schema
CREATE_TIME	TIMESTAMPTZ	Time when the schema was created.
IS_SYSTEM_SCHEMA	BOOLEAN	Indicates whether the schema was created for system use, where <i>t</i> is true and <i>f</i> is false.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

SEQUENCES

Displays information about [sequences](#) .

Column Name	Data Type	Description
SEQUENCE_NAMESPACE	VARCHAR	For Eon Mode databases, name of the namespace that contains the sequence.

SEQUENCE_SCHEMA	VARCHAR	The name of the schema that contains the sequence. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <code>n1.s</code> refers to schema <code>s</code> in namespace <code>n1</code> .
SEQUENCE_NAME	VARCHAR	One of the following: <ul style="list-style-type: none"> User-assigned name of a sequence created with CREATE SEQUENCE Auto-generated name assigned by Vertica for the sequence of an IDENTITY table column
OWNER_NAME	VARCHAR	One of the following: <ul style="list-style-type: none"> Owner of the named sequence Owner of the table where an IDENTITY column is defined
IDENTITY_TABLE_NAME	VARCHAR	Set only for IDENTITY column sequences, name of the column table.
SESSION_CACHE_COUNT	INTEGER	Count of values cached in a session.
ALLOW_CYCLE	BOOLEAN	Whether values cycle when a sequence reaches its minimum or maximum value, as set by CREATE SEQUENCE parameter CYCLE NO CYCLE .
OUTPUT_ORDERED	BOOLEAN	Values guaranteed to be ordered, always false.
INCREMENT_BY	INTEGER	Value by which sequences are incremented or decremented.
MINIMUM	INTEGER	Minimum value the sequence can generate.
MAXIMUM	INTEGER	Maximum value the sequence can generate.
CURRENT_VALUE	INTEGER	How many sequence numbers are distributed among all cluster nodes.
SEQUENCE_SCHEMA_ID	INTEGER	Unique numeric catalog ID of the sequence schema.
SEQUENCE_ID	INTEGER	Unique numeric catalog ID of the sequence.
OWNER_ID	INTEGER	Unique numeric catalog ID of the user who created the sequence.
IDENTITY_TABLE_ID	INTEGER	Set only for IDENTITY column sequences, unique numeric catalog ID of the column table.

Examples

Create a sequence:

```
=> CREATE SEQUENCE my_seq MAXVALUE 5000 START 150;
CREATE SEQUENCE
```

Return information about this sequence:

```
=> SELECT sequence_schema, sequence_name, owner_name, session_cache_count, increment_by, current_value FROM sequences;
sequence_schema | sequence_name | owner_name | session_cache_count | increment_by | current_value
-----
public          | my_seq       | dbadmin   | 250000              | 1           | 149
(2 rows)
```

[IDENTITY columns](#) are sequences that are defined in a table's DDL. [IDENTITY](#) column values automatically increment as new rows are added. To identify [IDENTITY](#) columns and their tables, query the system table [COLUMNS](#):

```

=> CREATE TABLE employees (employeeID IDENTITY, lname varchar(36), fname varchar(36));
CREATE TABLE
=> SELECT table_name, column_name, is_identity FROM columns WHERE is_identity = '1';
table_name | column_name | is_identity
-----+-----+-----
employees | employeeID | 1
(1 row)

```

Query **SEQUENCES** to get detailed information about the IDENTITY column sequence in **employees** :

```

=> SELECT sequence_schema, sequence_name, identity_table_name, sequence_id FROM sequences
   WHERE identity_table_name = 'employees';
sequence_schema | sequence_name | identity_table_name | sequence_id
-----+-----+-----+-----
public          | employees_employeeID_seq | employees          | 45035996273848816
(1 row)

```

Use the vsql command **\ds** to list all named and IDENTITY column sequences. The following results show the two sequences created previously:

```

=> \ds
List of Sequences
Schema | Sequence | CurrentValue | IncrementBy | Minimum | Maximum | AllowCycle | Comment
-----+-----+-----+-----+-----+-----+-----+-----
public | employees_employeeID_seq | 0 | 1 | 1 | 9223372036854775807 | f |
public | my_seq | 149 | 1 | 1 | 5000 | f |
(2 rows)

```

Note

The CurrentValue of both sequences is one less than its start number—0 and 149 for the IDENTITY column **employeeID** and named sequence **my_seq**, respectively:

- **employeeID** 's start number—by default set to 1 because the table DDL did not specify otherwise—is set to 0 because no rows have yet been added to the **employees** table.
- **my_seq** is set to 149 because **NEXTVAL** has not yet been called on it.

SESSION_SUBSCRIPTIONS

In an Eon Mode database, lists the shard subscriptions for all nodes, and whether the subscriptions are used to resolve queries for the current session. Nodes that will participate in resolving queries in this session have TRUE in their IS_PARTICIPATING column.

Column Name	Data Type	Description
NODE_OID	INTEGER	The OID of the subscribing node.
NODE_NAME	VARCHAR	The name of the subscribing node.
SHARD_OID	INTEGER	The OID of the shard the node subscribes to.
SHARD_NAME	VARCHAR	The name of the shard the node subscribes to.
IS_PARTICIPATING	BOOLEAN	Whether this subscription is used when resolving queries in this session.
IS_COLLABORATING	BOOLEAN	Whether this subscription is used to collaborate with a participating node when executing queries. This value is only true when queries are using elastic crunch scaling.

Examples

The following example demonstrates listing the subscriptions that are either participating or collaborating in the current session:

```
=> SELECT node_name, shard_name, is_collaborating, is_participating
       FROM V_CATALOG.SESSION_SUBSCRIPTIONS
       WHERE is_participating = TRUE OR is_collaborating = TRUE
       ORDER BY shard_name, node_name;
node_name | shard_name | is_collaborating | is_participating
```

```
-----+-----+-----+-----
v_verticadb_node0004 | replica | f | t
v_verticadb_node0005 | replica | f | t
v_verticadb_node0006 | replica | t | f
v_verticadb_node0007 | replica | f | t
v_verticadb_node0008 | replica | t | f
v_verticadb_node0009 | replica | t | f
v_verticadb_node0007 | segment0001 | f | t
v_verticadb_node0008 | segment0001 | t | f
v_verticadb_node0005 | segment0002 | f | t
v_verticadb_node0009 | segment0002 | t | f
v_verticadb_node0004 | segment0003 | f | t
v_verticadb_node0006 | segment0003 | t | f
(12 rows)
```

SHARDS

Lists the shards in your database.

Column Name	Data Type	Description
SHARD_OID	INTEGER	The OID of the shard.
SHARD_NAME	VARCHAR	The name of the shard.
SHARD_TYPE	VARCHAR	The type of the shard.
LOWER_HASH_BOUND	VARCHAR	The lower hash bound of the shard.
UPPER_HASH_BOUND	VARCHAR	The upper hash bound of the shard.
IS_REPLICATED	BOOLEAN	Defines if the shard is replicated.
HAS_OBJECTS	BOOLEAN	Defines if the shard contains objects.

Examples

```
=> SELECT * FROM SHARDS;
-[ RECORD 1 ]-----+-----
shard_oid   | 45035996273704980
shard_name  | replica
shard_type  | Replica
lower_hash_bound |
upper_hash_bound |
is_replicated | t
has_objects  | t
...
```

STORAGE_LOCATIONS

Provides information about storage locations, including IDs, labels, and status.

Column Name	Data Type	Description
-------------	-----------	-------------

LOCATION_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the storage location.
NODE_NAME	VARCHAR	The node name on which the storage location exists.
LOCATION_PATH	VARCHAR	The path where the storage location is mounted.
LOCATION_USAGE	VARCHAR	The type of information stored in the location: <ul style="list-style-type: none"> • DATA: Only data is stored in the location. • TEMP: Only temporary files that are created during loads or queries are stored in the location. • DATA,TEMP: Both types of files are stored in the location. • USER: The storage location can be used by users without their own credentials or dbadmin access. Users gain access to data by being granted access to the user storage location. • CATALOG: The area is used for the Vertica catalog. This usage is set internally and cannot be removed or changed.
SHARING_TYPE	VARCHAR	How this location is shared among database nodes, if it is: <ul style="list-style-type: none"> • SHARED: The path used by the storage location is used by all nodes. See the SHARED parameter to CREATE LOCATION. • COMMUNAL: the location is used for communal storage in Eon Mode. • NONE: The location is not shared among nodes.
IS_RETIRED	BOOLEAN	Whether the storage location has been retired. This column has a value of t (true) if the location is retired, or f (false) if it is not.
LOCATION_LABEL	VARCHAR	The label associated with a specific storage location, added with the ALTER_LOCATION_LABEL function.
RANK	INTEGER	The Access rank value either assigned or supplied to the storage location, as described in Prioritizing column access speed .
THROUGHPUT	INTEGER	The throughput performance of the storage location, measured in MB/sec. You can get location performance values using MEASURE_LOCATION_PERFORMANCE , and set them with the SET_LOCATION_PERFORMANCE function.
LATENCY	INTEGER	The measured latency of the storage location as number of data seeks per second. You can get location performance values using MEASURE_LOCATION_PERFORMANCE , and set them with the SET_LOCATION_PERFORMANCE function.
MAX_SIZE	INTEGER	Maximum size of the storage location in bytes.
DISK_PERCENT	VARCHAR	Maximum percentage of available node disk space that this storage location can use, set only if depot size is defined as a percentage, otherwise blank.

Privileges

Superuser

STORED_PROC_TRIGGERS

Contains information about [Triggers](#).

Column Name	Data Type	Description
TRIGGER_NAME	VARCHAR	The name of the trigger.
NAMESPACE_NAME	VARCHAR	For Eon Mode databases, the trigger's namespace .
SCHEMA_NAME	VARCHAR	The trigger's schema. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
OWNER	VARCHAR	The owner of the trigger.
PROCEDURE_NAME	VARCHAR	The name of the stored procedure .
PROCEDURE_ARGS	INTEGER	The number of formal parameters in the stored procedure.
ENABLED	BOOLEAN	Whether the trigger is enabled.

Examples

To view triggers:

```
=> SELECT * FROM stored_proc_triggers;
trigger_name | schema_name | owner | procedure_name | procedure_args | enabled
-----+-----+-----+-----+-----+-----
raise_trigger | public | dbadmin | raiseXY | 2 | t
```

SUBCLUSTER_RESOURCE_POOL_OVERRIDES

Displays subcluster-level overrides of settings for built-in global resource pools.

Column Name	Data Type	Description
POOL_OID	INTEGER	Unique identifier for the resource pool with settings overrides.
NAME	VARCHAR	The name of the built-in resource pool.
SUBCLUSTER_OID	INTEGER	Unique identifier for the subcluster with settings that override the global resource pool settings.
SUBCLUSTER_NAME	VARCHAR	The name of the subcluster with settings that overrides the global resource pool settings.
MEMORYSIZE	VARCHAR	The amount of memory allocated to the global resource pool.
MAXMEMORYSIZE	VARCHAR	Value assigned as the maximum size this resource pool can grow by borrowing memory from the GENERAL pool.
MAXQUERYMEMORYSIZE	VARCHAR	The maximum amount of memory allocated by this pool to process any query.

SUBCLUSTERS

This table lists all of the subclusters defined in the database. It contains an entry for each node in the database listing which subcluster it belongs to. Any subcluster that does not contain a node has a single entry in this table with empty **NODE_NAME** and **NODE_OID** columns. This table is only populated if the database is running in Eon Mode.

Column Name	Data Type	Description
-------------	-----------	-------------

SUBCLUSTER_OID	INTEGER	Unique identifier for the subcluster.
SUBCLUSTER_NAME	VARCHAR	The name of the subcluster.
NODE_OID	INTEGER	The catalog-assigned ID of the node.
NODE_NAME	VARCHAR	The name of the node.
PARENT_OID	INTEGER	The unique ID of the parent of the node (the database).
PARENT_NAME	VARCHAR	The name of the parent of the node (the database name).
IS_DEFAULT	BOOLEAN	Whether the subcluster is the default cluster .
IS_PRIMARY	BOOLEAN	Whether the subcluster is a primary subcluster .
CONTROL_SET_SIZE	INTEGER	The number of control nodes defined for this subcluster. This value is -1 when the large cluster feature is not enabled, or when every node in the subcluster must be a control node. See Large cluster for more information.

Examples

```
=> \x
Expanded display is on.
dbadmin=> SELECT * FROM SUBCLUSTERS;
-[ RECORD 1 ]-----+-----
subcluster_oid | 45035996273704978
subcluster_name | default_subcluster
node_oid       | 45035996273704982
node_name      | v_verticadb_node0001
parent_oid     | 45035996273704976
parent_name    | verticadb
is_default     | t
is_primary     | t
control_set_size | -1
-[ RECORD 2 ]-----+-----
subcluster_oid | 45035996273704978
subcluster_name | default_subcluster
node_oid       | 45035996273840970
node_name      | v_verticadb_node0002
parent_oid     | 45035996273704976
parent_name    | verticadb
is_default     | t
is_primary     | t
control_set_size | -1
-[ RECORD 3 ]-----+-----
subcluster_oid | 45035996273704978
subcluster_name | default_subcluster
node_oid       | 45035996273840974
node_name      | v_verticadb_node0003
parent_oid     | 45035996273704976
parent_name    | verticadb
is_default     | t
is_primary     | t
control_set_size | -1
```

SYSTEM_COLUMNS

Provides table column information for [SYSTEM_TABLES](#).

Column Name	Data Type	Description
TABLE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the table.
TABLE_SCHEMA	VARCHAR	The schema name for which information is listed.
TABLE_NAME	VARCHAR	The table name for which information is listed.
IS_SYSTEM_TABLE	BOOLEAN	Indicates whether the table is a system table, where <i>t</i> is true and <i>f</i> is false.
COLUMN_ID	VARCHAR	Catalog-assigned VARCHAR value that uniquely identifies a table column.
COLUMN_NAME	VARCHAR	The column name for which information is listed in the database.
DATA_TYPE	VARCHAR	The data type assigned to the column; for example VARCHAR(16).
DATA_TYPE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the data type.
DATA_TYPE_LENGTH	INTEGER	The maximum allowable length of the data type.
CHARACTER_MAXIMUM_LENGTH	INTEGER	The maximum allowable length of the column.
NUMERIC_PRECISION	INTEGER	The number of significant decimal digits.
NUMERIC_SCALE	INTEGER	The number of fractional digits.
DATETIME_PRECISION	INTEGER	For TIMESTAMP data type, returns the declared precision; returns null if no precision was declared.
INTERVAL_PRECISION	INTEGER	The number of fractional digits retained in the seconds field.
ORDINAL_POSITION	INTEGER	The position of the column relative to other columns in the table.
IS_NULLABLE	BOOLEAN	Indicates whether the column can contain null values, where <i>t</i> is true and <i>f</i> is false.
COLUMN_DEFAULT	VARCHAR	The default value of a column, such as empty or expression.

SYSTEM_TABLES

Returns a list of all system table names.

Column Name	Data Type	Description
TABLE_SCHEMA_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the schema.

TABLE_SCHEMA	VARCHAR	The schema name in which the system table resides, one of the following: <ul style="list-style-type: none"> • V_CATALOG • V_MONITOR
TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the table.
TABLE_NAME	VARCHAR	The name of the system table.
TABLE_DESCRIPTION	VARCHAR	A description of the system table's purpose.
IS_SUPERUSER_ONLY	BOOLEAN	Specifies whether the table is accessible only by superusers by default. If false, then the PUBLIC role has the privileges to access the system table.
IS_MONITORABLE	BOOLEAN	Specifies whether the table is accessible by a user with the SYSMONITOR role enabled.
IS_ACCESSIBLE_DURING_LOCKDOWN	BOOLEAN	Specifies whether RESTRICT_SYSTEM_TABLES_ACCESS revokes privileges from PUBLIC on the system table. These privileges can be restored with RELEASE_SYSTEM_TABLES_ACCESS . In general, this field is set to t (true) for system tables that contain information that is typically needed by most users, such as TYPES . Conversely, this field is set to f (false) for tables with data that should be restricted during lockdown, such as database settings and user information.

TABLE_CONSTRAINTS

Provides information about table constraints.

Column Name	Data Type	Description
CONSTRAINT_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the constraint.
CONSTRAINT_NAME	VARCHAR	The name of the constraint, if specified as UNIQUE, FOREIGN KEY, NOT NULL, PRIMARY KEY, or CHECK.
CONSTRAINT_SCHEMA_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the schema containing the constraint.
CONSTRAINT_KEY_COUNT	INTEGER	The number of constraint keys.
FOREIGN_KEY_COUNT	INTEGER	The number of foreign keys.
TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the table.
TABLE_NAME	VARCHAR	The name of the table that contains the UNIQUE, FOREIGN KEY, NOT NULL, or PRIMARY KEY constraint.
FOREIGN_TABLE_ID	INTEGER	The unique object ID of the foreign table referenced in a foreign key constraint (zero if not a foreign key constraint).
CONSTRAINT_TYPE	CHAR	Indicates the constraint type. Valid Values: <ul style="list-style-type: none"> • c — check • f — foreign • p — primary • u — unique

IS_ENABLED`	BOOLEAN	Indicates if a constraint for a primary key, unique key, or check constraint is currently enabled. Can be t (True) or f (False).
PREDICATE	VARCHAR	For check constraints, the SQL expression.

See also

[ANALYZE_CONSTRAINTS](#)

TABLES

Provides information about all tables in the database.

The TABLE_SCHEMA and TABLE_NAME columns are case-sensitive. To restrict a query based on those columns, use the case-insensitive ILIKE predicate. For example:

```
--> SELECT table_schema, table_name FROM v_catalog.tables
WHERE table_schema ILIKE 'Store%';
```

Column Name	Data Type	Description
TABLE_SCHEMA_ID	INTEGER	A unique numeric ID that identifies the schema and is assigned by the Vertica catalog.
TABLE_SCHEMA	VARCHAR	The schema name for which information is listed.
TABLE_NAMESPACE_NAME	VARCHAR	For Eon Mode databases, name of the namespace to which the table belongs.
TABLE_ID	INTEGER	A unique numeric ID that identifies the table and is assigned by the Vertica catalog.
TABLE_NAME	VARCHAR	The table name for which information is listed.
OWNER_ID	INTEGER	A unique numeric ID that identifies the owner and is assigned by the Vertica catalog.
OWNER_NAME	VARCHAR	The name of the user who created the table.
IS_TEMP_TABLE	BOOLEAN	Whether this table is a temporary table.
IS_SYSTEM_TABLE	BOOLEAN	Whether this table is a system table.
FORCE_OUTER	INTEGER	Whether this table is joined to another as an inner or outer input. For details, see Controlling join inputs .
IS_FLEXTABLE	BOOLEAN	Whether the table is a Flex table.
IS_SHARED	BOOLEAN	Whether the table is located on shared storage. Not used for temporary tables in Eon Mode.
HAS_AGGREGATE_PROJECTION	BOOLEAN	Whether the table has live aggregate projections.
SYSTEM_TABLE_CREATOR	VARCHAR	The name of the process that created the table, such as Designer.
PARTITION_EXPRESSION	VARCHAR	The table's partition expression .
CREATE_TIME	TIMESTAMP	When the table was created.
TABLE_DEFINITION	VARCHAR	For external tables, the COPY FROM portion of the table definition.
RECOVER_PRIORITY	INTEGER	The priority rank for the table for a Recovery By Table .
STORAGE_MODE	INTEGER	Deprecated, always set to DIRECT.
PARTITION_GROUP_EXPRESSION	VARCHAR	The expression of a GROUP BY clause that qualifies a table's partition clause .

ACTIVE_PARTITION_COUNT	INTEGER	The table's active partition count as set by CREATE TABLE or ALTER TABLE . If null, the table gets its active partition count from the ActivePartitionCount configuration parameter. For details, see Active and inactive partitions .
IS_MERGEOUT_ENABLED	BOOLEAN	Whether mergeout is enabled (t) or disabled (f) on ROS containers that consolidate projection data of this table. By default, mergeout is enabled on all tables. You can disable mergeout on a table with ALTER TABLE . For details, see Disabling mergeout on specific tables .
IMMUTABLE_ROWS_SINCE_TIMESTAMP	TIMESTAMPZ	Set only for immutable tables , the server system time when immutability was applied to this table. This value can help with long-term timestamp retrieval and efficient comparison.
IMMUTABLE_ROWS_SINCE_EPOCH	INTEGER	Set only for immutable tables , the epoch that was current when immutability was applied. This setting can help protect the table from attempts to pre-insert records with a future timestamp, so that row's epoch is less than the table's immutability epoch.
IS_EXTERNAL_ICEBERG_TABLE	BOOLEAN	Whether this table is an Iceberg table .

Examples

Find when tables were created:

```

-> SELECT table_schema, table_name, create_time FROM tables;
table_schema | table_name | create_time
-----
public | customer_dimension | 2011-08-15 11:18:25.784203-04
public | product_dimension | 2011-08-15 11:18:25.815653-04
public | promotion_dimension | 2011-08-15 11:18:25.850592-04
public | date_dimension | 2011-08-15 11:18:25.892347-04
public | vendor_dimension | 2011-08-15 11:18:25.942805-04
public | employee_dimension | 2011-08-15 11:18:25.966985-04
public | shipping_dimension | 2011-08-15 11:18:25.999394-04
public | warehouse_dimension | 2011-08-15 11:18:26.461297-04
public | inventory_fact | 2011-08-15 11:18:26.513525-04
store | store_dimension | 2011-08-15 11:18:26.657409-04
store | store_sales_fact | 2011-08-15 11:18:26.737535-04
store | store_orders_fact | 2011-08-15 11:18:26.825801-04
online_sales | online_page_dimension | 2011-08-15 11:18:27.007329-04
online_sales | call_center_dimension | 2011-08-15 11:18:27.476844-04
online_sales | online_sales_fact | 2011-08-15 11:18:27.49749-04
(15 rows)

```

Find out whether certain tables are temporary and flex tables:

```

-> SELECT distinct table_name, table_schema, is_temp_table, is_flextable FROM v_catalog.tables
   WHERE table_name ILIKE 't%';
table_name | table_schema | is_temp_table | is_flextable
-----+-----+-----+-----
t2_temp    | public      | t             | t
t1_keys    | public      | f             | f
t2_temp_keys | public     | f             | f
t3         | public      | t             | f
t1         | public      | f             | f
t9_keys    | public      | f             | f
t2_keys    | public      | f             | t
t6         | public      | t             | f
t5         | public      | f             | f
t2         | public      | f             | t
t8         | public      | f             | f
t7         | public      | t             | f
t4         | public      | t             | t
t2_keys_keys | public     | f             | f
t9         | public      | t             | t
(15 rows)

```

TEXT_INDICES

Provides summary information about the text indices in Vertica.

Column Name	Data Type	Description
INDEX_ID	INTEGER	A unique numeric ID that identifies the index and is assigned by the Vertica catalog.
INDEX_NAME	VARCHAR	The name of the text index.
INDEX_SCHEMA_NAME	VARCHAR	The schema name of the text index.
SOURCE_TABLE_ID	INTEGER	A unique numeric ID that identifies the table and is assigned by the Vertica catalog.
SOURCE_TABLE_NAME	VARCHAR	The name of the source table used to build the index.
SOURCE_TABLE_SCHEMA_NAME	VARCHAR	The schema name of the source table.
TOKENIZER_ID	INTEGER	A unique numeric ID that identifies the tokenizer and is assigned by the Vertica catalog.
TOKENIZER_NAME	VARCHAR	The name of the tokenizer used when building the index.
TOKENIZER_SCHEMA_NAME	VARCHAR	The schema name of the tokenizer.
STEMMER_ID	INTEGER	A unique numeric ID that identifies the stemmer and is assigned by the Vertica catalog.
STEMMER_NAME	VARCHAR	The name of the stemmer used when building the index.
STEMMER_SCHEMA_NAME	VARCHAR	The schema name of the stemmer.
TEXT_COL	VARCHAR	The text column used to build the index.

TYPES

Provides information about supported data types. This table does not include inlined complex types; see [COMPLEX_TYPES](#) instead. This table does include arrays and sets of primitive types.

Column Name	Data Type	Description
TYPE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the specific data type.
ODBC_TYPE	INTEGER	The numerical ODBC type.
ODBC_SUBTYPE	INTEGER	The numerical ODBC subtype, used to differentiate types such as time and interval that have multiple subtypes.
JDBC_TYPE	INTEGER	The numerical JDBC type.
JDBC_SUBTYPE	INTEGER	The numerical JDBC subtype, used to differentiate types such as time and interval that have multiple subtypes.
MIN_SCALE	INTEGER	The minimum number of digits supported to the right of the decimal point for the data type.
MAX_SCALE	INTEGER	The maximum number of digits supported to the right of the decimal point for the data type. A value of 0 is used for types that do not use decimal points.
COLUMN_SIZE	INTEGER	The number of characters required to display the type. See: http://msdn.microsoft.com/en-us/library/windows/desktop/ms711786%28v=VS.85%29.aspx for the details on COLUMN_SIZE for each type.
INTERVAL_MASK	INTEGER	For data types that are intervals, the bitmask to determine the range of the interval from the Vertica TYPE_ID. Details are available in the Vertica SDK.
TYPE_NAME	VARCHAR	The data type name associated with a particular data type ID.
CREATION_PARAMETERS	VARCHAR	A list of keywords, separated by commas, corresponding to each parameter that the application may specify in parentheses when using the name that is returned in the TYPE_NAME field. The keywords in the list can be any of the following: length, precision, or scale. They appear in the order that the syntax requires them to be used.

USER_AUDITS

Lists the results of database and object size audits generated by users calling the [AUDIT](#) function. See [Monitoring database size for license compliance](#) for more information.

Column Name	Data Type	Description
SIZE_BYTES	INTEGER	The estimated raw data size of the database
USER_ID	INTEGER	The ID of the user who generated the audit
USER_NAME	VARCHAR	The name of the user who generated the audit
OBJECT_ID	INTEGER	The ID of the object being audited
OBJECT_TYPE	VARCHAR	The type of object being audited (table, schema, etc.)
OBJECT_SCHEMA	VARCHAR	The schema containing the object being audited
OBJECT_NAME	VARCHAR	The name of the object being audited

AUDITED_SCHEMA_NAME	VARCHAR	The name of the schema on which you want to query HISTORICAL data. After running audit on a table, you can drop the table. In this case, object_schema becomes NULL.
AUDITED_OBJECT_NAME	VARCHAR	The name of the object on which you want to query HISTORICAL data. After running audit on a table, you can drop the table. In this case, object_name becomes NULL.
LICENSE_NAME	VARCHAR	The name of the license. After running a compliance audit, the value for this column is always vertica .
AUDIT_START_TIMESTAMP	TIMESTAMPTZ	When the audit started
AUDIT_END_TIMESTAMP	TIMESTAMPTZ	When the audit finished
CONFIDENCE_LEVEL_PERCENT	FLOAT	The confidence level of the size estimate
ERROR_TOLERANCE_PERCENT	FLOAT	The error tolerance used for the size estimate
USED_SAMPLING	BOOLEAN	Whether data was randomly sampled (if false, all of the data was analyzed)
CONFIDENCE_INTERVAL_LOWER_BOUND_BYTES	INTEGER	The lower bound of the data size estimate within the confidence level
CONFIDENCE_INTERVAL_UPPER_BOUND_BYTES	INTEGER	The upper bound of the data size estimate within the confidence level
SAMPLE_COUNT	INTEGER	The number of data samples used to generate the estimate
CELL_COUNT	INTEGER	The number of cells in the database

USER_CLIENT_AUTH

Provides information about the client authentication methods that are associated with database users. You associate an authentication method with a user using [GRANT \(Authentication\)](#).

Column Name	Data Type	Description
USER_OID	INTEGER	A unique identifier for that user.
USER_NAME	VARCHAR	Name of the user.
AUTH_OID	INTEGER	A unique identifier for the authentication method you are using.
AUTH_NAME	VARCHAR	Name that you gave to the authentication method.
GRANTED_TO	BOOLEAN	Name of the user with whom you have associated the authentication method using GRANT (Authentication) .

USER_CONFIGURATION_PARAMETERS

Provides information about [user-level configuration parameters](#) that are in effect for database users.

Column Name	Data Type	Description
USER_NAME	VARCHAR	Name of a database user with user-level settings.

PARAMETER_NAME	VARCHAR	The configuration parameter name.
CURRENT_VALUE	VARCHAR	The parameter's current setting for this user.
DEFAULT_VALUE	VARCHAR	The parameter's default value.

Privileges

Superuser only

Examples

```
=> SELECT * FROM user_configuration_parameters;
user_name | parameter_name | current_value | default_value
-----+-----+-----+-----
Yvonne | LoadSourceStatisticsLimit | 512 | 256
(1 row)

=> ALTER USER Ahmed SET DepotOperationsForQuery='FETCHES';
ALTER USER
=> ALTER USER Yvonne SET DepotOperationsForQuery='FETCHES';
ALTER USER
=> SELECT * FROM user_configuration_parameters;
user_name | parameter_name | current_value | default_value
-----+-----+-----+-----
Ahmed | DepotOperationsForQuery | FETCHES | ALL
Yvonne | DepotOperationsForQuery | FETCHES | ALL
Yvonne | LoadSourceStatisticsLimit | 512 | 256
(3 rows)
```

USER_FUNCTION_PARAMETERS

Provides information about the parameters of a C++ user-defined function (UDx). You can only view parameters that have the [Properties.visible](#) parameter set to **TRUE** .

Column Name	Data Type	Description
NAMESPACE_NAME	VARCHAR	For Eon Mode databases, name of the namespace that contains the function.
SCHEMA_NAME	VARCHAR(128)	The schema to which the function belongs. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
FUNCTION_NAME	VARCHAR(128)	The name assigned by the user to the user-defined function.
FUNCTION_TYPE	VARCHAR(128)	The type of user-defined function. For example, 'User Defined Function'.
FUNCTION_ARGUMENT_TYPE	VARCHAR(8192)	The number and data types of input arguments for the function.
PARAMETER_NAME	VARCHAR(128)	The name of the parameter for the user-defined function.
DATA_TYPE	VARCHAR(128)	The data type of the parameter.
DATA_TYPE_ID	INTEGER	A number specifying the ID for the parameter's data type.
DATA_TYPE_LENGTH	INTEGER	The maximum length of the parameter's data type.

IS_REQUIRED	BOOLEAN	Indicates whether the parameter is required or not. If set to TRUE, and you don't provide the parameter, Vertica throws an error.
CAN_BE_NULL	BOOLEAN	Indicates whether the parameter can be passed as a NULL value. If set to FALSE, you pass the parameter with a NULL value, Vertica throws an error.
COMMENT	VARCHAR(128)	A user-supplied description of the parameter.

Privileges

Any user can query the USER_FUNCTION_PARAMETERS table. However, users can only see table information about those UDX functions which the user has permission to use.

See also

- [Developing user-defined extensions \(UDxs\)](#)
- [UDx parameters](#)

USER_FUNCTIONS

Returns metadata about user-defined SQL functions (which store commonly used SQL expressions as a function in the Vertica catalog) and user-defined functions.

Column Name	Data Type	Description
SCHEMA_NAME	VARCHAR	The name of the schema in which this function exists.
FUNCTION_NAME	VARCHAR	The name assigned by the user to the SQL function or user-defined function.
PROCEDURE_TYPE	VARCHAR	The type of user-defined function. For example, 'User Defined Function'.
FUNCTION_RETURN_TYPE	VARCHAR	The data type name that the SQL function returns.
FUNCTION_ARGUMENT_TYPE	VARCHAR	The number and data types of parameters for the function.
FUNCTION_DEFINITION	VARCHAR	The SQL expression that the user defined in the SQL function's function body.
VOLATILITY	VARCHAR	The SQL function's volatility (whether a function returns the same output given the same input). Can be immutable , volatile , or stable .
IS_STRICT	BOOLEAN	Indicates whether the SQL function is strict , where <i>t</i> is true and <i>f</i> is false.
IS_FENCED	BOOLEAN	Indicates whether the function runs in Fenced and unfenced modes or not.
COMMENT	VARCHAR	A comment about this function provided by the function creator.

Notes

- The volatility and strictness of a SQL function are automatically inferred from the function definition in order that Vertica determine the correctness of usage, such as where an immutable function is expected but a volatile function is provided.
- The volatility and strictness of a UDX is defined by the UDX's developer.

Examples

Create a SQL function called **myzeroifnull** in the public schema:

```
=> CREATE FUNCTION myzeroifnull(x INT) RETURN INT
AS BEGIN
  RETURN (CASE WHEN (x IS NOT NULL) THEN x ELSE 0 END);
END;
```

Now query the `USER_FUNCTIONS` table. The query returns just the `myzeroifnull` macro because it is the only one created in this schema:

```
=> SELECT * FROM user_functions;
-[ RECORD 1 ]-----+-----
schema_name      | public
function_name    | myzeroifnull
procedure_type   | User Defined Function
function_return_type | Integer
function_argument_type | x Integer
function_definition | RETURN CASE WHEN (x IS NOT NULL) THEN x ELSE 0 END
volatility       | immutable
is_strict        | f
is_fenced        | f
comment         |
```

See also

- [CREATE FUNCTION \(SQL\)](#)
- [ALTER FUNCTION \(scalar\)](#)
- [DROP FUNCTION](#)

USER_PROCEDURES

Provides information about [stored procedures](#) and [external procedures](#). Users can only view procedures that they can execute.

Column Name	Data Type	Description
<code>PROCEDURE_NAME</code>	VARCHAR	The name of the procedure.
<code>OWNER</code>	VARCHAR	The owner (definer) of the procedure.
<code>LANGUAGE</code>	VARCHAR	The language in which the procedure is defined. For external procedures, this will be EXTERNAL. For stored procedures, this will be one of the supported languages .
<code>SECURITY</code>	VARCHAR	The privileges to use when executing the procedure, one of the following: <ul style="list-style-type: none"> • <code>DEFINER</code> : Executes the procedure with the privileges of the owner (definer) of the procedure. • <code>INVOKER</code> : Executes the procedure with the privileges of the invoker. For details, see Executing stored procedures .
<code>PROCEDURE_ARGUMENTS</code>	VARCHAR	The arguments of the procedure.
<code>NAMESPACE_NAME</code>	VARCHAR	For Eon Mode databases, name of the namespace that contains the procedure.
<code>SCHEMA_NAME</code>	VARCHAR	The schema in which the procedure was defined. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <code>n1.s</code> refers to schema <code>s</code> in namespace <code>n1</code> .

Privileges

Non-superusers can only view information on a procedure if they have:

- USAGE privileges on the procedure's schema.

- Ownership or EXECUTE privileges on the procedure.

Examples

```
=> SELECT * FROM user_procedures;
 procedure_name | owner | language | security | procedure_arguments | schema_name
-----+-----+-----+-----+-----+-----
accurate_auc   | dbadmin | PL/SQL | INVOKER | relation varchar, observation_col varchar, probability_col varchar, epsilon float | public
conditionalTable | dbadmin | PL/SQL | INVOKER | b boolean | public
update_salary  | dbadmin | PL/SQL | INVOKER | x int, y varchar | public
(3 rows)
```

USER_SCHEDULES

Contains information about [schedules](#).

Column Name	Data Type	Description
SCHEDULE_NAME	VARCHAR	The name of the schedule.
NAMESPACE_NAME	VARCHAR	For Eon Mode databases, the schedule's namespace .
SCHEMA_NAME	VARCHAR	The schedule's schema. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
OWNER	VARCHAR	The owner of the schedule.
ATTACHED_TRIGGER	VARCHAR	The trigger attached to the schedule , if any.
ATTACHED_TRIGGER	BOOLEAN	Whether the schedule is enabled.
DATE_TIME_TYPE	VARCHAR	The format for the scheduled event, one of the following: <ul style="list-style-type: none"> • CRON • DATE_TIME_LIST
DATE_TIME_STRING	VARCHAR	The string used to schedule the event, one of the following: <ul style="list-style-type: none"> • A cron expression • A comma-separated list of timestamps

Examples

To view schedules:

```
=> SELECT * FROM user_schedules;
 schedule_name | schema_name | owner | attached_trigger | enabled | date_time_type | date_time_string
-----+-----+-----+-----+-----+-----+-----
daily_1am      | management | dbadmin | log_user_actions | t      | CRON           | 0 1 * * *
biannual_22_noon_gmt | public | dbadmin | refresh_logs | t      | DATE_TIME_LIST | 2022-01-01 12:00:00-00, 2022-06-01 12:00:00-00
```

USER_TRANSFORMS

Lists the currently-defined user-defined transform functions (UDTFs).

Column Name	Data Type	Description
SCHEMA_NAME	VARCHAR(128)	The name of the schema containing the UDTF.

FUNCTION_NAME	VARCHAR(128)	The SQL function name assigned by the user.
FUNCTION_RETURN_TYPE	VARCHAR(128)	The data types of the columns the UDTF returns.
FUNCTION_ARGUMENT_TYPE	VARCHAR(8192)	The data types of the columns that make up the input row.
FUNCTION_DEFINITION	VARCHAR(128)	A string containing the name of the factory class for the UDTF, and the name of the library that contains it.
IS_FENCED	BOOLEAN	Whether the UDTF runs in fenced mode.

Privileges

No explicit permissions are required; however, users see only UDTFs contained in schemas to which they have read access.

USERS

Provides information about all users in the database.

Tip

To see if a role has been assigned to a user, call the function [HAS_ROLE](#).

Column Name	Data Type	Description
USER_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the user.
USER_NAME	VARCHAR	The user name for which information is listed.
IS_SUPER_USER	BOOLEAN	A system flag, where <i>t</i> (true) identifies the superuser created at the time of installation. All other users are denoted by <i>f</i> (false).
PROFILE_NAME	VARCHAR	The name of the profile to which the user is assigned. The profile controls the user's password policy.
IS_LOCKED	BOOLEAN	Whether the user's account is locked. A locked user cannot log into the system.
LOCK_TIME	TIMESTAMPTZ	When the user's account was locked. Used to determine when to automatically unlock the account, if the user's profile has a PASSWORD_LOCK_TIME parameter set.
RESOURCE_POOL	VARCHAR	The resource pool to which the user is assigned.
MANAGED_BY_OAUTH2_AUTH_ID	INTEGER	The ID of the OAuth authentication record used to authenticate and provision the user, if any.

LAST_LOGIN_TIME	TIMESTAMPTZ	<p>The last time the user logged in.</p> <p>Note The LAST_LOGIN_TIME as recorded by the USERS system table is not persistent; if the database is restarted, the LAST_LOGIN_TIME for users created by just-in-time user provisioning is set to the database start time (this appears as an empty value in LAST_LOGIN_TIME).</p> <p>You can view the database start time by querying the DATABASES system table:</p> <pre>=> SELECT database_name, start_time FROM databases; database_name start_time ----- VMart 2023-02-06 14:26:50.630054-05 (1 row)</pre>
MEMORY_CAP_KB	VARCHAR	The maximum amount of memory a query run by the user can consume, in kilobytes.
TEMP_SPACE_CAP_KB	VARCHAR	The maximum amount of temporary disk space a query run by the user can consume, in kilobytes.
RUN_TIME_CAP	VARCHAR	The maximum amount of time any of the user's queries are allowed to run.
MAX_CONNECTIONS	VARCHAR	The maximum number of connections allowed for this user.
CONNECTION_LIMIT_MODE	VARCHAR	Indicates whether the user sets connection limits through the node or in database mode.
IDLE_SESSION_TIMEOUT	VARCHAR	<p>How the user handles idle session timeout limits, one of the following:</p> <ul style="list-style-type: none"> unlimited : There is no idle session time limit for the user. default : The user's idle session time limit is the value of the DefaultIdleSessionTimeout database parameter, or if that parameter is not set or the user is a superuser, there is no timeout limit. To view the value of DefaultIdleSessionTimeout parameter, use the SHOW DATABASE statement: <pre>=> SHOW DATABASE DEFAULT DEFAULTIDLESESSIONTIMEOUT;</pre> Interval literal : Interval after which the user's idle session is disconnected.
GRACE_PERIOD	VARCHAR	Specifies how long a user query can block on any session socket, while awaiting client input or output. If the socket is blocked for a continuous period that exceeds the grace period setting, the server shuts down the socket and throws a fatal error. The session is then terminated.
ALL_ROLES	VARCHAR	Roles assigned to the user. An asterisk in ALL_ROLES output means role granted WITH ADMIN OPTION. See Database Roles.
DEFAULT_ROLES	VARCHAR	Default roles assigned to the user. An asterisk in DEFAULT_ROLES output means role granted WITH ADMIN OPTION. See Enabling roles automatically .
SEARCH_PATH	VARCHAR	Sets the default schema search path for the user. See Setting search paths .
LDAP_DN	VARCHAR	Indicates whether or not the Vertica Analytic Database user maps to an LDAP Link user. When the column is set to dn , the Vertica user maps to LDAP Link..
LDAP_URI_HASH	INTEGER	The URI hash number for the LDAP user.

IS_ORPHANED_FROM_LDAP	BOOLEAN	<p>Indicates if the user is disconnected (orphaned) from LDAP, set to one of the following:</p> <ul style="list-style-type: none"> t : User is orphaned f : User is not orphaned <p>For more information see Troubleshooting LDAP link issues</p>

VIEW_COLUMNS

Provides view attribute information.

Note

If you drop a table that is referenced by a view, Vertica does not drop the view. However, attempts to access information about it from **VIEW_COLUMNS** return an error that the view is invalid.

Column Name	Data Type	Description
TABLE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies this view.
TABLE_NAMESPACE	VARCHAR	For Eon Mode databases, name of the namespace that contains the view.
TABLE_SCHEMA	VARCHAR	<p>The name of this view's schema.</p> <p>If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .</p>
TABLE_NAME	VARCHAR	The view name.
COLUMN_ID	VARCHAR	A unique VARCHAR ID, assigned by the Vertica catalog, that identifies a column in this view.
COLUMN_NAME	VARCHAR	The name of a column in this view.
DATA_TYPE	VARCHAR	The data type of a view column.
DATA_TYPE_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies a view column's data type.
DATA_TYPE_LENGTH	INTEGER	The data type's maximum length.
CHARACTER_MAXIMUM_LENGTH	INTEGER	The column's maximum length, valid only for character types.
NUMERIC_PRECISION	INTEGER	The column's number of significant decimal digits.
NUMERIC_SCALE	INTEGER	The column's number of fractional digits.
DATETIME_PRECISION	INTEGER	For TIMESTAMP data type, returns the declared precision; returns null if no precision was declared.
INTERVAL_PRECISION	INTEGER	The number of fractional digits retained in the seconds field.

ORDINAL_POSITION	INTEGER	The position of the column relative to other columns in the view.
-------------------------	---------	---

[VIEWS](#)

VIEW_TABLES

Shows details about view-related dependencies, including the table that reference a view, its schema, and owner.

Column Name	Data Type	Description
TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies theview.
TABLE_SCHEMA	VARCHAR	Name of the view schema.
TABLE_NAME	VARCHAR	Name of the view.
REFERENCE_TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies theview's source table.
REFERENCE_TABLE_SCHEMA	VARCHAR	Name of the view's source table schema.
REFERENCE_TABLE_NAME	VARCHAR	Name of the view's source table.
REFERENCE_TABLE_OWNER_ID	INTEGER	Catalog-assigned integer value that uniquely identifies theview owner.

VIEWS

Provides information about all [views](#) within the system. See [Views](#) for more information.

Column Name	Data Type	Description
TABLE_SCHEMA_ID	INTEGER	Catalog-assigned integer value that uniquely identifies theview schema.
TABLE_NAMESPACE	VARCHAR	For Eon Mode databases, namespace that contains the view.
TABLE_SCHEMA	VARCHAR	The name of the view schema. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the view.
TABLE_NAME	VARCHAR	The view name.
OWNER_ID	INTEGER	Catalog-assigned integer value that uniquely identifies theview owner.
OWNER_NAME	VARCHAR	View owner's user name
VIEW_DEFINITION	VARCHAR	The query that defines the view.
IS_SYSTEM_VIEW	BOOLEAN	Indicates whether the view is a system view.
SYSTEM_VIEW_CREATOR	VARCHAR	View creator's user name.
CREATE_TIME	TIMESTAMP	Specifies when this view was created.
IS_LOCAL_TEMP_VIEW	BOOLEAN	Indicates whether this view is a temporary view stored locally.

INHERIT_PRIVILEGES	BOOLEAN	Indicates whether inherited privileges are enabled for this view. For details, see Setting privilege inheritance on tables and views .
---------------------------	---------	--

[VIEW_COLUMNS](#)

WORKLOAD_ROUTING_RULES

Lists the routing rules that map [workloads](#) to [subclusters](#).

Column Name	Data Type	Description
OID	INTEGER	The object identifier for the routing rule .
WORKLOAD	VARCHAR	The name of the workload. When specified by a client (either as a connection property or as a session parameter with SET SESSION WORKLOAD), the client's queries are executed by the subcluster specified by the workload routing rule.
SUBCLUSTER_OID	INTEGER	The object identifier for the Subcluster .
SUBCLUSTER_NAME	VARCHAR	The subcluster that contains the Execution node that executes client queries for its associated workload.
PRIORITY	INTEGER	A non-negative INTEGER , the priority of the workload. The greater the value, the greater the priority. If a user or their role is granted multiple routing rules , the one with the greatest priority applies.

Privileges

Superuser

Examples

The following query shows two rules that define the following behavior:

- Clients with workload **reporting** are routed to subcluster **default_subcluster**.
- Clients with workload **analytics** are randomly routed to **sc_01** or **sc_02**.

```

-> SELECT * FROM v_catalog.workload_routing_rules;

  oid      | workload | subcluster_oid | subcluster_name | priority
-----+-----+-----+-----+-----
45035996273850122 | reporting | 45035996273704962 | default_subcluster | 5
45035996273849658 | analytics | 45035996273849568 | sc_01              | 4
45035996273849658 | analytics | 45035996273849568 | sc_02              | 0

```

ACTIVE_EVENTS

Returns all active events in the cluster. See [Monitoring events](#).

Column Name	Data Type	Description
<code>NODE_NAME</code>	VARCHAR	The node name where the event occurred.
<code>EVENT_CODE</code>	INTEGER	A numeric ID that indicates the type of event. See Event Types for a list of event type codes.
<code>EVENT_ID</code>	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the specific event.
<code>EVENT_SEVERITY</code>	VARCHAR	The severity of the event from highest to lowest. These events are based on standard syslog severity types. <ul style="list-style-type: none">• 0—Emergency• 1—Alert• 2—Critical• 3—Error• 4—Warning• 5—Notice• 6—Informational• 7—Debug
<code>EVENT_POSTED_TIMESTAMP</code>	TIMESTAMP	The year, month, day, and time the event was reported. The time is posted in military time.
<code>EVENT_EXPIRATION</code>	VARCHAR	The year, month, day, and time the event expire. The time is posted in military time. If the cause of the event is still active, the event is posted again.
<code>EVENT_CODE_DESCRIPTION</code>	VARCHAR	A brief description of the event and details pertinent to the specific situation.
<code>EVENT_PROBLEM_DESCRIPTION</code>	VARCHAR	A generic description of the event.
<code>REPORTING_NODE</code>	VARCHAR	The name of the node within the cluster that reported the event.
<code>EVENT_SENT_TO_CHANNELS</code>	VARCHAR	The event logging mechanisms that are configured for Vertica. These can include <code>vertica.log</code> , (configured by default) syslog, and SNMP.
<code>EVENT_POSTED_COUNT</code>	INTEGER	Tracks the number of times an event occurs. Rather than posting the same event multiple times, Vertica posts the event once and then counts the number of additional instances in which the event occurs.

ALLOCATOR_USAGE

Provides real-time information on the allocation and reuse of memory pools for a Vertica node.

There are two memory pools in Vertica, global and SAL. The global memory pool is related to Vertica catalog objects. The SAL memory pool is related to the system storage layer. These memory pools are physical structures from which Vertica allocates and reuses portions of memory.

Within the memory pools, there are two allocation types. Both global and SAL memory pools include chunk and object memory allocation types.

- *Chunk* allocations are from tiered storage, and are grouped into sizes, in bytes, that are powers of 2.
- *Object* allocations are object types, for example, a table or projection. Each object assumes a set size.

The table provides detailed information on these memory pool allocations.

Column Name	Data Type	Description
<code>NODE_NAME</code>	VARCHAR	The name of the node from which Vertica has collected this allocator information.

POOL_NAME	VARCHAR	<p>One of two memory pools:</p> <ul style="list-style-type: none"> • global: Memory pool is related to Vertica catalog objects. • SAL: Memory pool is related to the system storage layer.
ALLOCATION_TYPE	VARCHAR	<p>One of two memory allocation types:</p> <ul style="list-style-type: none"> • chunk: Chunk allocations are grouped into sizes that are powers of 2. • object: Object allocations assume a set amount of memory based upon the specific object.
UNIT_SIZE	INTEGER	<p>The size, in bytes, of the memory allocation.</p> <p>For example, if the allocation type is a table (an object type), then Vertica allots 8 bytes.</p>
FREE_COUNT	INTEGER	<p>Indicates the count of blocks of freed memory that Vertica has reserved for future memory needs.</p> <p>For example, if you delete a table, Vertica reserves the 8 bytes originally allotted for the table. The 8 bytes freed become 1 unit of memory that Vertica adds to this column.</p>
FREE_BYTES	INTEGER	<p>Indicates the number of freed memory bytes.</p> <p>For example, with a table deletion, Vertica adds 8 bytes to this column.</p> <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px;"> <p>Note</p> <p>Vertica does not release memory after originally allocating it, unless the node or database is restarted.</p> </div>
USED_COUNT	INTEGER	<p>Indicates the count of in-use blocks for this allocation.</p> <p>For example, if your database includes two table objects, Vertica adds 2 to this column.</p>
USED_BYTES	INTEGER	<p>The number of bytes of in-use blocks of memory.</p> <p>For example, if your database includes two table objects, each of which assume 8 bytes, Vertica adds 16 to this column.</p>
TOTAL_SIZE	INTEGER	<p>Indicates the number of bytes that is the sum of all free and used memory.</p>
CAPTURE_TIME	TIMESTAMPZ	<p>Indicates the current timestamp for when Vertica collected the for this table.</p>
ALLOCATION_NAME	VARCHAR	<p>Provides the name of the allocation type.</p> <ul style="list-style-type: none"> • If the allocation is an object type, provides the name of the object. For example, <code>CAT::Schema</code>. Object types can also have the name <code>internal</code>, meaning that the object is an internal data structure. Those object types that are not internal are prefaced with either <code>CAT</code> or <code>SAL</code>. Those prefaced with <code>CAT</code> indicate memory from the global memory pool. <code>SAL</code> indicates memory from the system storage memory pool. • If the allocation type is chunk, indicates a power of 2 in this field to represent the number of bytes assumed by the chunk. For example, <code>2^5</code>.

Sample: how memory pool memory is allotted, retained, and freed

The following table shows sample column values based upon a hypothetical example. The sample illustrates how column values change based upon addition or deletion of a table object.

- When you add a table object (`t1`), Vertica assumes a `UNIT_SIZE` of 8 bytes, with a `USED_COUNT` of 1.

- When you add a second table object (t2), the **USED_COUNT** increases to 2. Since each object assumes 8 bytes, **USED_BYTES** increases to 16.
- When you delete one of the two table objects, Vertica **USED_COUNT** decreases to 1, and **USED_BYTES** decreases to 8. Since Vertica retains the memory for future use, **FREE_BYTES** increases to 8, and **FREE_COUNT** increases to 1.
- Finally, when you create a new table object (t3), Vertica frees the memory for reuse. **FREE_COUNT** and **FREE_BYTES** return to 0.

Column Names	Add One Table Object (t1)	Add a Second Table Object (t2)	Delete a Table Object (t2)	Create a New Table Object (t3)
NODE_NAME	v_vmart_node0001	v_vmart_node0001	v_vmart_node0001	v_vmart_node0001

COLUMN_STORAGE

Returns the amount of disk storage used by each column of each projection on each node.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
COLUMN_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the column.
COLUMN_NAME	VARCHAR	The column name for which information is listed.
ROW_COUNT	INTEGER	The number of rows in the column.
USED_BYTES	INTEGER	The disk storage allocation of the column in bytes.
ENCODINGS	VARCHAR	The encoding type for the column.
COMPRESSION	VARCHAR	The compression type for the column. You can compare ENCODINGS and COMPRESSION columns to see how different encoding types affect column storage when optimizing for compression.
ROS_COUNT	INTEGER	The number of ROS containers.

PROJECTION_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the projection.
PROJECTION_NAME	VARCHAR	The associated projection name for the column.
PROJECTION_SCHEMA	VARCHAR	The name of the schema associated with the projection.
ANCHOR_TABLE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the anchor table.
ANCHOR_TABLE_NAME	VARCHAR	The associated table name.
ANCHOR_TABLE_SCHEMA	VARCHAR	The associated table's schema name. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <code>n1.s</code> refers to schema <code>s</code> in namespace <code>n1</code> .
ANCHOR_TABLE_NAMESPACE	VARCHAR	For Eon Mode databases, name of the namespace that contains the table.
ANCHOR_TABLE_COLUMN_ID	VARCHAR	Catalog-assigned VARCHAR value that uniquely identifies a table column.
ANCHOR_TABLE_COLUMN_NAME	VARCHAR	The name of the anchor table.

COMMUNAL_CLEANUP_RECORDS

Eon Mode only

This system table lists files that Vertica considers leaked on an Eon Mode communal storage. Leaked files are files that are detected as needing deletion but were missed by the normal cleanup mechanisms. This information helps you determine how much space on the communal storage you can reclaim or have reclaimed by cleaning up the leaked files.

Column Name	Data Type	Description
detection_timestamp	TIMESTAMPTZ	Timestamp at which the file was detected as leaked.
location_path	VARCHAR	The path of communal storage location.
file_name	VARCHAR	The name of the leaked file.
size_in_bytes	INTEGER	The size of the leaked file in bytes.
queued_for_delete	BOOLEAN	Specifies whether the file was queued for deletion. Files queued for deletion might not be deleted right away. Also, a subsequent call to <code>clean_communal_storage</code> reports these files as leaked if the files hadn't already been deleted.

Examples

```
=> SELECT clean_communal_storage('true');
clean_communal_storage
-----
CLEAN COMMUNAL STORAGE
Total leaked files: 10
Total size: 217088
Files have been queued for deletion.
Check communal_cleanup_records for more information.
(1 row)

=> SELECT * FROM communal_cleanup_records;
detection_timestamp | location_path | file_name | size_in_bytes | queued_for_delete

[CLEAN_COMMUNAL_STORAGE](#)

COMMUNAL_TRUNCATION_STATUS

Eon Mode only

Stores information on the state of the cluster in the case of a catalog truncation event.

Column Name	Data Type	Description
CURRENT_CATALOG_VERSION	VARCHAR	Current value of the catalog truncation version (CTV).
CLUSTER_TRUNCATION_VERSION	VARCHAR	The value of the CTV from the <code>cluster_config.json</code> file.

Examples

```
=> SELECT * FROM COMMUNAL_TRUNCATION_STATUS;
current_catalog_version | cluster_truncation_version
-----+-----
35 | 35
```

CONFIGURATION_CHANGES

Records the change history of system [configuration parameters](#). This information is useful for identifying:

- Who changed the configuration parameter value
- When the configuration parameter was changed
- Whether nonstandard settings were in effect in the past

Column Name	Data Type	Description
EVENT_TIMESTAMP	TIMESTAMPTZ	Time when the row was recorded.
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
USER_ID	INTEGER	Identifier of the user who changed configuration parameters.

USER_NAME	VARCHAR	Name of the user who changed configuration parameters at the time Vertica recorded the session.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
PARAMETER	VARCHAR	Name of the changed parameter. See Configuration parameter management for a detailed list of supported parameters.
VALUE	VARCHAR	New value of the configuration parameter.

Privileges
Superuser

CONFIGURATION_PARAMETERS

Provides information about all configuration parameters that are currently in use by the system.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node names of the database cluster. ALL indicates that all nodes have the same value.
PARAMETER_NAME	VARCHAR	The parameter name.
CURRENT_VALUE	VARCHAR	The parameter's current setting.
RESTART_VALUE	VARCHAR	The parameter's value after the next restart.
DATABASE_VALUE	VARCHAR	The value that is set at the database level. If no database-level value is set, the value reflects the default value.
DEFAULT_VALUE	VARCHAR	The parameter's default value.
CURRENT_LEVEL	VARCHAR	Level at which CURRENT_VALUE is set, one of the following: <ul style="list-style-type: none"> • NODE • DATABASE • SESSION • DEFAULT
RESTART_LEVEL	VARCHAR	Level at which the parameter will be set after the next restart, one of the following: <ul style="list-style-type: none"> • NODE • DATABASE • DEFAULT
IS_MISMATCH	BOOLEAN	Whether CURRENT_VALUE and RESTART_VALUE match.
GROUPS	VARCHAR	A group to which the parameter belongs—for example, OptVOptions. <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px;"> <p>Note Most configuration parameters do not belong to any group.</p> </div>

ALLOWED_LEVELS	VARCHAR	Levels at which the specified parameter can be set, a comma-delimited list of any of the following values: <ul style="list-style-type: none"> • DATABASE • NODE • SESSION • USER
SUPERUSER_VISIBLE_ONLY	BOOLEAN	Whether non-superusers can view all parameter settings. If true, the following columns are masked to non-superusers: <ul style="list-style-type: none"> • CURRENT_VALUE • RESTART_VALUE • DATABASE_VALUE • DEFAULT_VALUE
CHANGE_UNDER_SUPPORT_GUIDANCE	BOOLEAN	Whether the parameter is intended for use only under guidance from Vertica technical support.
CHANGE_REQUIRES_RESTART	BOOLEAN	Whether the configuration change requires a restart.
DESCRIPTION	VARCHAR	Describes the parameter's usage.

Examples

The following example shows a case where the parameter requires a restart for the new setting to take effect:

```

=> SELECT * FROM CONFIGURATION_PARAMETERS WHERE parameter_name = 'RequireFIPS';
{ RECORD 1 }-----
node_name          | ALL
parameter_name    | RequireFIPS
current_value      | 0
restart_value      | 0
database_value     | 0
default_value      | 0
current_level      | DEFAULT
restart_level      | DEFAULT
is_mismatch        | f
groups             |
allowed_levels     | DATABASE
superuser_visible_only | f
change_under_support_guidance | f
change_requires_restart | t
description        | Execute in FIPS mode

```

The following example shows a case where a non-superuser is viewing a parameter with restricted visibility:

```

=> \c VMart nonSuperuser
You are now connected to database "VMart" as user "nonSuperuser".
=> SELECT * FROM CONFIGURATION_PARAMETERS WHERE superuser_visible_only = 't';
{ RECORD 1 }-----
node_name          | ALL
parameter_name    | S3BucketCredentials
current_value     | *****
restart_value     | *****
database_value    | *****
default_value     | *****
current_level     | DEFAULT
restart_level     | DEFAULT
is_mismatch       | f
groups            |
allowed_levels    | SESSION, DATABASE
superuser_visible_only | t
change_under_support_guidance | f
change_requires_restart | f
description       | JSON list mapping S3 buckets to specific credentials.

```

[Configuration parameter management](#)

CPU_USAGE

Records CPU usage history on the system.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
START_TIME	TIMESTAMP	Beginning of history interval.
END_TIME	TIMESTAMP	End of history interval.
AVERAGE_CPU_USAGE_PERCENT	FLOAT	Average CPU usage in percent of total CPU time (0-100) during history interval.
PHYSICAL_CORES	INTEGER	Number of physical cores used by the node.

Privileges

Superuser

CRITICAL_HOSTS

Lists the critical hosts whose failure would cause the database to become unsafe and force a shutdown.

Column Name	Data Type	Description
HOST_NAME	VARCHAR	Name of a critical host

Privileges

None

CRITICAL_NODES

Lists the [critical nodes](#) whose failure would cause the database to become unsafe and force a shutdown.

Column Name	Data Type	Description
NODE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the node.

NODE_NAME	VARCHAR	Name of a critical node.
------------------	---------	--------------------------

CRITICAL_SUBCLUSTERS

Lists the primary subclusters whose loss would cause the database to become unsafe and force it to shutdown. Vertica checks this table before stopping a subcluster to ensure it will not trigger a database shutdown. If you attempt to stop or remove a subcluster in this table, Vertica returns an error message. See [Starting and stopping subclusters](#) for more information.

This table only has contents when the database is in Eon Mode and when one or more subclusters are critical.

Column Name	Data Type	Description
SUBCLUSTER_OID	INTEGER	Unique identifier for the subcluster.
SUBCLUSTER_NAME	VARCHAR	The name of the subcluster in a critical state.

Examples

```
=> SELECT * FROM critical_subclusters;
subcluster_oid | subcluster_name
-----+-----
45035996273704996 | default_subcluster
(1 row)
```

CURRENT_SESSION

Returns information about the current active session. Use this table to find out the current session's **sessionID** and get the duration of the previously-run query.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node for which information is listed
USER_NAME	VARCHAR	Name used to log into the database, NULL if the session is internal
CLIENT_OS_HOSTNAME	VARCHAR	The hostname of the client as reported by their operating system.
CLIENT_HOSTNAME	VARCHAR	The IP address and port of the TCP socket from which the client connection was made; NULL if the session is internal. Vertica accepts either IPv4 or IPv6 connections from a client machine. If the client machine contains mappings for both IPv4 and IPv6, the server randomly chooses one IP address family to make a connection. This can cause the CLIENT_HOSTNAME column to display either IPv4 or IPv6 values, based on which address family the server chooses.

TYPE	INTEGER	Identifies the session type, one of the following integer values: <ul style="list-style-type: none"> • 1: Client • 2: DBD • 3: Merge out • 4: Move out • 5: Rebalance cluster • 6: Recovery • 7: Refresh • 8: Shutdown • 9: License audit • 10: Timer service • 11: Connection • 12: VSpread • 13: Sub-session • 14: Repartition table
CLIENT_PID	INTEGER	Process identifier of the client process that issued this connection. This process might be on a different machine than the server.
LOGIN_TIMESTAMP	TIMESTAMP	When the user logged into the database or the internal session was created. This column can help identify open sessions that are idle.
SESSION_ID	VARCHAR	Identifier required to close or interrupt a session. This identifier is unique within the cluster at any point in time, but can be reused when the session closes.
CLIENT_LABEL	VARCHAR	User-specified label for the client connection that can be set when using ODBC. See Label in ODBC DSN connection properties .
TRANSACTION_START	TIMESTAMP	When the current transaction started, NULL if no transaction is running
TRANSACTION_ID	VARCHAR	Hexadecimal identifier of the current transaction, NULL if no transaction is in progress
TRANSACTION_DESCRIPTION	VARCHAR	Description of the current transaction
STATEMENT_START	TIMESTAMP	When the current statement started execution, NULL if no statement is running
STATEMENT_ID	VARCHAR	Unique numeric ID for the currently-running statement, NULL if no statement is being processed. Combined, TRANSACTION_ID and STATEMENT_ID uniquely identify a statement within a session.
LAST_STATEMENT_DURATION_US	INTEGER	Duration in microseconds of the last completed statement
CURRENT_STATEMENT	VARCHAR	The currently-running statement, if any. NULL indicates that no statement is currently being processed.
LAST_STATEMENT	VARCHAR	NULL if the user has just logged in, otherwise the currently running statement or most recently completed statement.
EXECUTION_ENGINE_PROFILING_CONFIGURATION	VARCHAR	See Profiling Settings below.
QUERY_PROFILING_CONFIGURATION	VARCHAR	See Profiling Settings below.
SESSION_PROFILING_CONFIGURATION	VARCHAR	See Profiling Settings below.

CLIENT_TYPE	VARCHAR	Type of client from which the connection was made, one of the following: <ul style="list-style-type: none"> • ADO.NET Driver • ODBC Driver • JDBC Driver • vsqI
CLIENT_VERSION	VARCHAR	Client version
CLIENT_OS	VARCHAR	Client operating system
CLIENT_OS_USER_NAME	VARCHAR	Identifies the user that logged into the database, also set for unsuccessful login attempts.
REQUESTED_PROTOCOL	VARCHAR	Communication protocol version that the ODBC client driver sends to Vertica server, used to support backward compatibility with earlier server versions.
EFFECTIVE_PROTOCOL	VARCHAR	Minimum protocol version supported by client and driver.

Profiling settings

The following columns show settings for different profiling categories:

- **EXECUTION_ENGINE_PROFILING_CONFIGURATION**
- **QUERY_PROFILING_CONFIGURATION**
- **SESSION_PROFILING_CONFIGURATION**

These can have the following values:

- Empty: No profiling is set
- **Session** : On for current session.
- **Global** : On by default for all sessions.
- > **Session** , **Global** : On by default for all sessions, including current session.

For information about controlling profiling settings, see [Enabling profiling](#).

DATA_COLLECTOR

Shows settings for all [Data collector](#) components: their current [retention policy properties](#) and other data collection statistics.

Data Collector is on by default. To turn it off, set configuration parameter EnableDataCollector to 0.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node name on which data is stored.
COMPONENT	VARCHAR	Name of the component.
TABLE_NAME	VARCHAR	The data collector table name for which information is listed.
DESCRIPTION	VARCHAR	Short description about the component.
ACCESS_RESTRICTED	BOOLEAN	Indicates whether access to the table is restricted to the DBADMIN, PSEUDOSUPERUSER, or SYSMONITOR roles.
MEMORY_BUFFER_SIZE_KB	INTEGER	Specifies in kilobytes the maximum amount of data that is buffered in memory before moving it to disk. You can modify this value with SET_DATA_COLLECTOR_POLICY .

DISK_SIZE_KB	INTEGER	Specifies in kilobytes the maximum disk space allocated for this component's Data Collector table. If set to 0, the Data Collector retains only as much component data as it can buffer in memory, as specified by MEMORY_BUFFER_SIZE_KB. You can modify this value with SET_DATA_COLLECTOR_POLICY .
INTERVAL_SET	BOOLEAN	Boolean, specifies whether time-based retention is enabled (INTERVAL_TIME is \geq 0).
INTERVAL_TIME	INTERVAL	<p>INTERVAL data type that specifies how long data of a given component is retained in that component's Data Collector table. You can modify this value with SET_DATA_COLLECTOR_POLICY or SET_DATA_COLLECTOR_TIME_POLICY.</p> <p>For example, if you specify component TupleMoverEvents and set interval-time to an interval of two days ('2 days':interval), the Data Collector table <code>dc_tuple_mover_events</code> retains records of Tuple Mover activity over the last 48 hours. Older Tuple Mover data are automatically dropped from this table.</p> <div style="background-color: #e6f2ff; padding: 10px; border: 1px solid #add8e6;"> <p>Note</p> <p>Setting a component's policy's interval_time property has no effect on how much data storage the Data Collector retains on disk for that component. Maximum disk storage capacity is determined by the disk_size_kb property. Setting the interval_time property only affects how long data is retained by the component's Data Collector table. For details, see Configuring data retention policies.</p> </div>
RECORD_TOO_BIG_ERRORS	INTEGER	Integer that increments by one each time an error is thrown because data did not fit in memory (based on the data collector retention policy).
LOST_BUFFERS	INTEGER	Number of buffers lost.
LOST_RECORDS	INTEGER	Number of records lost.
RETIRED_FILES	INTEGER	Number of retired files.
RETIRED_RECORDS	INTEGER	Number of retired records.
CURRENT_MEMORY_RECORDS	INTEGER	The current number of rows in memory.
CURRENT_DISK_RECORDS	INTEGER	The current number of rows stored on disk.
CURRENT_MEMORY_BYTES	INTEGER	Total current memory used in kilobytes.
CURRENT_DISK_BYTES	INTEGER	Total current disk space used in kilobytes.
FIRST_TIME	TIMESTAMP	Timestamp of the first record.
LAST_TIME	TIMESTAMP	Timestamp of the last record
KB_PER_DAY	FLOAT	Total kilobytes used per day.

Examples

Get the current status of resource pools:

```
=> SELECT * FROM data_collector WHERE component = 'ResourcePoolStatus' ORDER BY node_name;
-[ RECORD 1 ]-----+-----
node_name      | v_vmart_node001
component      | ResourcePoolStatus
table_name     | dc_resource_pool_status
description    | Resource Pool status information
access_restricted | t
```

```

DATA_LOADER_EVENTS

Lists events from all [data loaders](#), including the file path, whether the load succeeded, and how many times it has been retried. You must own or have any privilege (EXECUTE, ALTER, or DROP) on a data loader to see its events in this table.

To prevent unbounded growth, records in this table are purged periodically. You can set the purge frequency for individual data loaders when creating or altering the loader. See [CREATE DATA LOADER](#) and [ALTER DATA LOADER](#). The default is 14 days.

Column Name	Column Type	Description
DATA_LOADER_NAMESPACE	VARCHAR	For Eon Mode databases, namespace of the data loader that performed this load.
DATA_LOADER_SCHEMA	VARCHAR	Schema for the data loader that performed this load. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
DATA_LOADER_NAME	VARCHAR	Name of the data loader that performed this load.
TIME_STAMP	TIMESTAMPTZ	Time when Vertica recorded the event.
FILE_NAME	VARCHAR	Path that was loaded (or attempted).
TRANSACTION_ID	VARCHAR	Unique identifier for the transaction in which the load occurred.
LOAD_STATUS	VARCHAR	OK if the load succeeded or FAIL if it did not.
ROWS_LOADED	INTEGER	If a single file was loaded, the number of rows. If more than one file was loaded in a single batch, this value is null. For batch loads, FILE_SIZE_BYTES can be helpful in place of row counts.
FAILURE_REASON	VARCHAR	If the load failed, an explanatory message.
RETRY_ATTEMPT	INTEGER	0 if this was the first attempt to load the file, otherwise the number of retries including this one.
FILE_SIZE_BYTES	INTEGER	File size in bytes when the data loader was executed.
BATCH_ID	INTEGER	Identifier, unique within the transaction, for the batch this file was part of. If a file was loaded individually, this value is null.

DATA_LOADERS

Lists all defined data loaders.

Column Name	Column Type	Description
NAME	VARCHAR	Loader name.
NAMESPACENAME	VARCHAR	For Eon Mode databases, namespace in which the loader is defined.

SCHEMANAME	VARCHAR	Schema in which the loader is defined. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
OWNER	VARCHAR	Vertica user who created the loader.
COPYSTMT	VARCHAR	COPY statement used by this loader.
RETRYLIMIT	INT	Number of times to retry a failed file load. For loaders that do not specify an explicit value, this value is updated if the value of the DataLoaderDefaultRetryLimit configuration parameter changes.
HISTORYRETENTIONINTERVAL	INTERVAL	How long to wait before purging rows in the loader's monitoring table. See CREATE DATA LOADER .
ENABLED	BOOLEAN	Whether the data loader is enabled. EXECUTE DATA LOADER does not run a disabled data loader.
TRIGGER	VARCHAR	External trigger for this data loader, if any.

Examples

```

-> SELECT * FROM DATA_LOADERS,
name | schemaname | owner | copystmt | retrylimit | historyretentioninterval | enabled | trigger
-----|-----|-----|-----|-----|-----|-----|-----
dl | public | dbadmin | copy sales from 's3://data/*.dat' | 3 | 14 days | t |
(1 row)

```

DATA_READS

Eon Mode only

Lists each storage location that a query reads in Eon Mode. If the query fetches data from multiple locations, this table provides a row for each location per node that read data. For example, a query might run on three nodes and fetch data from the depot and communal storage. In this case, the table displays six rows for the query: three rows for each node's depot read, and three for each node's communal storage read.

Note

This table is only populated in Eon Mode.

Column Name	Column Type	Description
START_TIME	TIMESTAMP	When Vertica started reading data from the location.
NODE_NAME	VARCHAR	Name of the node that fetched the data
SESSION_ID	VARCHAR	Unique numeric ID assigned by the Vertica catalog, which identifies the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
USER_ID	INT	Unique numeric ID assigned by the Vertica catalog, which identifies the user.
USER_NAME	VARCHAR	Name of the user running the query.
TRANSACTION_ID	INT	Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, TRANSACTION_ID returns NULL.

STATEMENT_ID	INT	Unique numeric ID for the statement that read the data. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID and STATEMENT_ID uniquely identifies a statement within a session; these columns are useful for creating joins with other system tables.
REQUEST_ID	INT	ID of the data request.
LOCATION_ID	INT	ID of the storage location read.
LOCATION_PATH	VARCHAR	Path of the storage container read by the query.
BYTES_READ	INT	Number of bytes read by the query from this location.

Examples

```
=> SELECT * FROM V_MONITOR.DATA_READS WHERE TRANSACTION_ID = 45035996273707457;
```

```

```

DATABASE_BACKUPS

Lists historical information for each backup that successfully completed after running the [vbr](#) utility. This information is useful for determining whether to create a new backup before you advance the [AHM](#). Because this system table displays historical information, its contents do not always reflect the current state of a backup repository. For example, if you delete a backup from a repository, the DATABASE_BACKUPS system table continues to display information about it.

To list existing backups, run [vbr](#) as described in [Viewing backups](#).

Column Name	Data Type	Description
BACKUP_TIMESTAMP	TIMESTAMP	The timestamp of the backup.
NODE_NAME	VARCHAR	The name of the initiator node that performed the backup.
SNAPSHOT_NAME	VARCHAR	The name of the backup, as specified in the <code>snapshotName</code> parameter of the <code>vbr</code> configuration file.
BACKUP_EPOCH	INTEGER	The database epoch at which the backup was saved.
NODE_COUNT	INTEGER	The number of nodes backed up in the completed backup, and as listed in the <code>[Mapping n]</code> sections of the configuration file.
OBJECTS	VARCHAR	The name of the object(s) contained in an object-level backup. This column is empty if the record is for a full cluster backup.
FILE_SYSTEM_TYPE	VARCHAR	The type of file system, such as Linux.

Privileges

Superuser

DATABASE_CONNECTIONS

Lists the connections to other databases for importing and exporting data. See [Moving Data Between Vertica Databases](#).

Column Name	Data Type	Description
DATABASE	VARCHAR	The name of the connected database
USERNAME	VARCHAR	The username used to create the connection
HOST	VARCHAR	The host name used to create the connection
PORT	VARCHAR	The port number used to create the connection
ISVALID	BOOLEAN	Whether the connection is still open and usable or not

Examples

```
=> CONNECT TO VERTICA vmart USER dbadmin PASSWORD " ON '10.10.20.150',5433;
CONNECT
=> SELECT * FROM DATABASE_CONNECTIONS;
database | username | host | port | isvalid
-----+-----+-----+-----+-----
vmart | dbadmin | 10.10.20.150 | 5433 | t
(1 row)
```

DATABASE_MIGRATION_STATUS

Provides real-time and historical data on [Enterprise-to-Eon database migration](#) attempts.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of a node in the source Enterprise database.
TRANSACTION_ID	VARCHAR	Hexadecimal identifier of the migration process transaction.

PHASE	VARCHAR	<p>A stage of database migration on a given node, one of the following, listed in order of execution:</p> <ul style="list-style-type: none"> • Catalog Conversion: Conversion of enterprise-mode catalog to Eon-compatible catalog. <p>Note No data is transferred during this phase, so BYTES_TO_TRANSFER and BYTES_TRANSFERED are always set to 0.</p> <ul style="list-style-type: none"> • Data Transfer: Transfer of data files and library files to communal storage • Catalog Transfer: Includes transfer of checkpoint and transaction log files.
STATUS	VARCHAR	<p>Specifies status of a given phase, one of the following:</p> <ul style="list-style-type: none"> • RUNNING • COMPLETED • ABORT <p>ABORT indicates a given migration phase was unable to complete—for example, the client disconnected, or a network outage occurred—and the migration returned with an error. In this case, call MIGRATE_ENTERPRISE_TO_EON again to restart migration. For details, see Handling Interrupted Migration.</p>
BYTES_TO_TRANSFER	INTEGER	<p>For each migration phase, the size of data to transfer to communal storage, set when phase status is RUNNING:</p> <ul style="list-style-type: none"> • Catalog Conversion: 0 • Data Transfer: Size of data files and library files • Catalog Transfer: Size of transaction logs
BYTES_TRANSFERRED	INTEGER	<p>For each migration phase, the size of data transferred to communal storage. This value is updated while phase status is RUNNING, and set to the total number of bytes transferred when status is COMPLETED:</p> <ul style="list-style-type: none"> • Catalog Conversion: 0 • Data Transfer: Size of data files and library files • Catalog Transfer: Size of transaction logs
COMMUNAL_STORAGE_LOCATION	VARCHAR	URL of targeted communal storage location
START_TIME	TIMESTAMP	Demarcate the start and end of each PHASE-specified migration operation.
END_TIME		

Privileges

Superuser

Examples

The following example shows data of a migration that is in progress:

```
=> SELECT node_name, phase, status, bytes_to_transfer, bytes_transferred, communal_storage_location FROM database_migration_status ORDER BY node_name, start_time;
```

node_name	phase	status	bytes_to_transfer	bytes_transferred	communal_storage_location
v_vmart_node0001	Catalog Conversion	COMPLETED	0	0	s3://verticadbbucket/
v_vmart_node0001	Data Transfer	COMPLETED	1134	1134	s3://verticadbbucket/
v_vmart_node0001	Catalog Transfer	COMPLETED	3765	3765	s3://verticadbbucket/
v_vmart_node0002	Catalog Conversion	COMPLETED	0	0	s3://verticadbbucket/
v_vmart_node0002	Data Transfer	COMPLETED	1140	1140	s3://verticadbbucket/
v_vmart_node0002	Catalog Transfer	COMPLETED	3766	3766	s3://verticadbbucket/
v_vmart_node0003	Catalog Conversion	COMPLETED	0	0	s3://verticadbbucket/
v_vmart_node0003	Data Transfer	RUNNING	5272616	183955	s3://verticadbbucket/

DELETE_VECTORS

Holds information on deleted rows to speed up the delete process.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node storing the deleted rows.
NAMESPACE_NAME	VARCHAR	For Eon Mode databases, namespace where the deleted rows are located.
SCHEMA_NAME	VARCHAR	The name of the schema where the deleted rows are located. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
PROJECTION_NAME	VARCHAR	The name of the projection where the deleted rows are located.
DV_OID	INTEGER	The unique numeric ID (OID) that identifies this delete vector.
STORAGE_OID	INTEGER	The unique numeric ID (OID) that identifies the storage container that holds the delete vector.
SAL_STORAGE_ID	VARCHAR	Unique hexadecimal numeric ID assigned by the Vertica catalog, which identifies the storage.
DELETED_ROW_COUNT	INTEGER	The number of rows deleted.
USED_BYTES	INTEGER	The number of bytes used to store the deletion.
START_EPOCH	INTEGER	The start epoch of the data in the delete vector.
END_EPOCH	INTEGER	The end epoch of the data in the delete vector.

Examples

After you delete data from a Vertica table, that data is marked for deletion. To see the data that is marked for deletion, query the DELETE_VECTORS system table.

Run PURGE to remove the delete vectors from ROS containers.

```

=> SELECT * FROM test1;
number
-----
 3
12
33
87
43
99
(6 rows)
=> DELETE FROM test1 WHERE number > 50;
OUTPUT
-----
 2
(1 row)
=> SELECT * FROM test1;
number
-----
43
 3
12
33
(4 rows)
=> SELECT node_name, projection_name, deleted_row_count FROM DELETE_VECTORS;
 node_name | projection_name | deleted_row_count
-----+-----+-----
v_vmart_node0002 | test1_b1 | 1
v_vmart_node0001 | test1_b1 | 1
v_vmart_node0001 | test1_b0 | 1
v_vmart_node0003 | test1_b0 | 1
(4 rows)
=> SELECT PURGE();
...
(Table: public.test1) (Projection: public.test1_b0)
(Table: public.test1) (Projection: public.test1_b1)
...
(4 rows)

```

After the ancient history mark (AHM) advances:

```

=> SELECT * FROM DELETE_VECTORS;
(No rows)

```

DEPLOY_STATUS

Records the history of deployed Database Designer designs and their deployment steps.

Column Name	Data Type	Description
EVENT_TIME	TIMESTAMP	Time when the row recorded the event.
USER_NAME	VARCHAR	Name of the user who deployed a design at the time Vertica recorded the session.
DEPLOY_NAME	VARCHAR	Name the deployment, same as the user-specified design name.

DEPLOY_STEP	VARCHAR	Steps in the design deployment.
DEPLOY_STEP_STATUS	VARCHAR	Textual status description of the current step in the deploy process.
DEPLOY_STEP_COMPLETE_PERCENT	FLOAT	Progress of current step in percentage (0-100).
DEPLOY_COMPLETE_PERCENT	FLOAT	Progress of overall deployment in percentage (0-100).
ERROR_MESSAGE	VARCHAR	Error or warning message during deployment.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

DEPLOYMENT_PROJECTION_STATEMENTS

Contains information about [CREATE PROJECTION](#) statements used to deploy a database design. Each row contains information about a different [CREATE PROJECTION](#) statement. The function [DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY](#) populates this table.

Column Name	Column Type	Description
DEPLOYMENT_ID	INTEGER	Unique ID that Database Designer assigned to the deployment.
DESIGN_NAME	VARCHAR	Unique name that the user assigned to the design.
DEPLOYMENT_PROJECTION_ID	INTEGER	Unique ID assigned to the output projection by Database Designer.
STATEMENT_ID	INTEGER	Unique ID assigned to the statement type that creates the projection.
STATEMENT	VARCHAR	Text for the statement that creates the projection.

DEPLOYMENT_PROJECTIONS

Contains information about projections created and dropped during the design. Each row contains information about a different projection. Database Designer populates this table after the design is deployed.

Column Name	Column Type	Description
deployment_id	INTEGER	Unique ID that Database Designer assigned to the deployment.
deployment_projection_id	INTEGER	Unique ID that Database Designer assigned to the output projection.
design_name	VARCHAR	Name of the design being deployed.
deployment_projection_name	VARCHAR	Name that Database Designer assigned to the projection.
anchor_table_schema	VARCHAR	Name of the schema that contains the table the projection is based on. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
anchor_table_name	VARCHAR	Name of the table the projection is based on.
deployment_operation	VARCHAR	Action being taken on the projection, for example, add or drop.

<code>deployment_projection_type</code>	VARCHAR	Indicates whether Database Designer has proposed new projections for this design (DBD) or is using the existing catalog design (CATALOG). The REENCODED suffix indicates that the projection sort order and segmentation are the same, but the projection columns have new encodings: <ul style="list-style-type: none"> • DBD • CATALOG • DBD_REENCODED • CATALOG_REENCODED
<code>deploy_weight</code>	INTEGER	Weight of this projection in creating the design. This field is always 0 for projections that have been dropped.
<code>estimated_size_on_disk</code>	INTEGER	Approximate size of the projection on disk, in MB.

DEPOT_EVICTIONS

Eon Mode only

Records data on [eviction](#) of objects from the depot.

Column Name	Data Type	Description
START_TIME	TIMESTAMP	Demarcate the start and end of each depot eviction operation.
END_TIME		
NODE_NAME	VARCHAR	Name of a node where the eviction occurred.
SESSION_ID	VARCHAR	Unique numeric ID assigned by the Vertica catalog, which identifies the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
USER_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the user.
USER_NAME	VARCHAR	The user who made changes to the depot.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, TRANSACTION_ID returns NULL.
STATEMENT_ID	INTEGER	Unique numeric ID for the statement that caused the eviction. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID and STATEMENT_ID uniquely identifies a statement within a session; these columns are useful for creating joins with other system tables.
REQUEST_ID	INTEGER	Unique identifier of the query request in the user session.
STORAGE_ID	VARCHAR	Unique hexadecimal numeric ID assigned by the Vertica catalog, which identifies the storage.
STORAGE_OID	INTEGER	Numeric ID assigned by the Vertica catalog, which identifies the storage.
FILE_SIZE_BYTES	INTEGER	The size of the file in bytes that was evicted.
NUMBER_HITS	INTEGER	The number of times the file was accessed.
LAST_ACCESS_TIME	TIMESTAMP	The last time the file was read.

REASON	VARCHAR	The reason the file was evicted, one of the following: <ul style="list-style-type: none"> • CLEAR DEPOT • DEPOT FILL AT STARTUP • DEPOT SIZE CHANGE • DROP OBJECT • DROP SUBSCRIPTION • EVICTION DUE TO NEW • LOAD • PEER TO PEER FILL • QUERY
IS_PINNED	BOOLEAN	Whether the object has a pinning policy .
IS_ANTI_PINNED	BOOLEAN	Whether the object has an anti-pinning policy .

Examples

```
=> SELECT * FROM V_MONITOR.DEPOT_EVICTIONS LIMIT 2;
-[ RECORD 1 ]-----+-----
start_time   | 2019-02-20 15:32:26.765937+00

DEPOT_FETCH_QUEUE

Eon Mode only

Lists all pending depot requests for queried file data to fetch from communal storage.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that requested the fetch.
SAL_STORAGE_ID	VARCHAR	Unique hexadecimal numeric ID assigned by the Vertica catalog, which identifies the storage.
TRANSACTION_ID	INTEGER	Identifies the transaction that contains the fetch-triggering query.
SOURCE_FILE_NAME	VARCHAR	Full path in communal storage of the file to fetch.
DESTINATION_FILE_NAME	VARCHAR	Destination path of the file to fetch.

Examples

```
=> \x
Expanded display is on.
=> SELECT * FROM depot_fetch_queue;
-[ RECORD 1 ]-----+-----
node_name      | v_example_db_node0002
sal_storage_id | 029b6fac864e1982531dcde47d00edc500d00000001d5e7

```

DEPOT_FETCHES

Eon Mode only

Records data of depot fetch requests.

Note

Vertica reports all fetches to this table, including failed fetch attempts and their causes.

Column Name	Data Type	Description
START_TIME	TIMESTAMP	Demarcate the start and end of each depot fetch operation.
END_TIME		
NODE_NAME	VARCHAR	Identifies the node that initiated fetch request.
TRANSACTION_ID	INTEGER	Uniquely identifies the transaction of the query that required the fetched file.
STORAGE_ID	VARCHAR	Unique hexadecimal numeric ID assigned by the Vertica catalog, to identify the storage.
STORAGE_OID	INTEGER	Numeric ID assigned by the Vertica catalog, which identifies the storage.
FILE_SIZE_BYTES	INTEGER	Fetch size in bytes.

SOURCE_FILE	VARCHAR	Source file path used, set to null if the file was fetched from a peer.
DESTINATION_FILE	VARCHAR	Destination file path
SOURCE_NODE	VARCHAR	Source node from which the file was fetched, set to one of the following: <ul style="list-style-type: none">• Name of the source node if file was fetched from a peer• Null if file was fetched from communal storage
IS_SUCCESSFUL	BOOLEAN	Boolean, specifies whether this fetch succeeded.
REASON	VARCHAR	Reason why the fetch failed, null if IS_SUCCESSFUL is true.

Examples

```
=> \x
```

DEPOT_FILES

Eon Mode only

Lists objects that are currently cached in the database depots.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the depot node.
SAL_STORAGE_ID	VARCHAR	Unique hexadecimal numeric ID assigned by the Vertica catalog, which identifies the storage.
STORAGE_OID	INTEGER	Numeric ID assigned by the Vertica catalog, which identifies the storage.
COMMUNAL_FILE_PATH	VARCHAR	Communal storage path to the file. On AWS, this is an S3 URI.
DEPOT_FILE_PATH	VARCHAR	Depot path to the file.
SHARD_NAME	VARCHAR	Name of the shard this file is a part of.
STORAGE_TYPE	VARCHAR	Type of system storing this file.
NUMBER_OF_ACCESSES	INTEGER	Number of times this file has been accessed.
FILE_SIZE_BYTES	INTEGER	How large the file is in bytes.
LAST_ACCESS_TIME	TIMESTAMPTZ	When the file was last accessed.
ARRIVAL_TIME	TIMESTAMPTZ	When Vertica loaded the file into the depot.
SOURCE	VARCHAR	How the data came to be cached, one of the following: <ul style="list-style-type: none"> • LOAD • QUERY • PEER TO PEER FILL • DEPOT FILL AT STARTUP
IS_PINNED	BOOLEAN	Whether a pinning policy is set on the cached data.
IS_ANTI_PINNED	BOOLEAN	Whether an anti-pinning policy is set on the cached data.

DEPOT_PIN_POLICIES

Eon Mode only

Lists all objects —tables, projections, and table partitions—with [depot eviction policies](#).

Column Name	Data Type	Description
NAMESPACE_NAME	VARCHAR	For Eon Mode databases, object namespace .
SCHEMA_NAME	VARCHAR	Object schema. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <code>n1.s</code> refers to schema <code>s</code> in namespace <code>n1</code> .
OBJECT_NAME	VARCHAR	Object name.
SUBCLUSTER_NAME	VARCHAR	Name of the subcluster where the pinning policy is set, null if the policy is set on all database depots.

POLICY_DETAILS	VARCHAR	Object type, one of the following: <ul style="list-style-type: none"> • Table • Projection • Partition
MIN_VAL	VARCHAR	If POLICY_DETAILS is set to Partition, the range of contiguous partition keys specified by this policy.
MAX_VAL		
LOCATION_LABEL	VARCHAR	Depot's storage location label.
POLICY_TYPE	VARCHAR	Policy type set on this object (PIN or ANTI-PIN), if any.

DEPOT_SIZES

Eon Mode only

Reports depot caching capacity on Vertica nodes.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node containing the depot.
LOCATION_OID	INTEGER	Catalog-assigned integer value that uniquely identifies the storage location storing the depot.
LOCATION_PATH	VARCHAR	The path where the depot is stored.
LOCATION_LABEL	VARCHAR	The label associated with the depot's storage location.
MAX_SIZE_BYTES	INTEGER	The maximum size the depot can contain, in bytes.
CURRENT_USAGE_BYTES	INTEGER	The current size of the depot, in bytes.

Examples

```
=> \x
```

Expanded display is on.

```
=> SELECT * FROM Depot_Sizes;
```

```
-[ RECORD 1 ]-----+-----
```

```
node_name      | v_verticadb_node0003
location_oid   | 45035996273823200
location_path  | /vertica/data/verticadb/v_verticadb_node0003_depot
location_label | auto-data-depot
max_size_bytes | 0
current_usage_bytes | 0
```

```
-[ RECORD 2 ]-----+-----
```

```
node_name      | v_verticadb_node0001
location_oid   | 45035996273823196
location_path  | /vertica/data/verticadb/v_verticadb_node0001_depot
location_label | auto-data-depot
max_size_bytes | 33686316032
current_usage_bytes | 206801871
```

```
-[ RECORD 3 ]-----+-----
```

```
node_name      | v_verticadb_node0002
location_oid   | 45035996273823198
location_path  | /vertica/data/verticadb/v_verticadb_node0002_depot
location_label | auto-data-depot
max_size_bytes | 0
current_usage_bytes | 0
```

DEPOT_UPLOADS

Eon Mode only

Lists details about depot uploads to communal storage.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node on which the depot resides.
PLAN_ID	VARCHAR	A unique node-specific numeric ID for each plan run by the Optimizer.
SUBMIT_TIME	TIMESTAMP	The time the task was submitted to the uploader.
START_TIME	TIMESTAMP	The time the upload started.
END_TIME	TIMESTAMP	The time the upload ended.
SOURCE_FILE	VARCHAR	The source file path used.
DESTINATION_FILE	VARCHAR	The destination file path.
FILE_SIZE_BYTES	INTEGER	The size of the uploaded file, in bytes.
MEMORY_USED_KB	INTEGER	The size of the uploader file buffer for the task. Valid for a task with a RUNNING or COMPLETED status. For a RUNNING status, this shows the current file buffer size, (whatever the uploader is using, which may grow over time for large uploads). For a COMPLETED status, this shows the largest size used in case the buffer grew during the upload.

STATUS	VARCHAR	The status of the task, valid values are: COMPLETED - the task has completed QUEUED - the task is still in the queue, but haven't been picked up by the uploader. RUNNING - the task is currently running and the corresponding file is uploading.
---------------	---------	---

DESIGN_QUERIES

Contains info about design queries for a given design. The following functions populate this table:

- [DESIGNER_ADD_DESIGN_QUERIES](#)
- [DESIGNER_ADD_DESIGN_QUERIES_FROM_RESULTS](#)
- [DESIGNER_ADD_DESIGN_QUERY](#)

Column Name	Column Type	Description
DESIGN_ID	INTEGER	Unique id that Database Designer assigned to the design.
DESIGN_NAME	VARCHAR	Name that you specified for the design.
DESIGN_QUERY_ID	INTEGER	Unique id that Database Designer assigned to the design query.
DESIGN_QUERY_ID_INDEX	INTEGER	Database Designer chunks the query text if it exceeds the maximum attribute size before storing it in this table. Database Designer stored all chunks stored under the same value of DESIGN_QUERY_ID. DESIGN_QUERY_ID_INDEX keeps track of the order of the chunks, starting with 0 and ending in n, the index of the final chunk.
QUERY_TEXT	VARCHAR	Text of the query chunk, or the entire query text if it does not exceed the maximum attribute size.
WEIGHT	FLOAT	A value from 0 to 1 that indicates the importance of that query in creating the design. Assign a higher weight to queries that you run frequently so that Database Designer prioritizes those queries in creating the design. Default: 1.
DESIGN_QUERY_SEARCH_PATH	VARCHAR	The search path with which the query is to be parsed.
DESIGN_QUERY_SIGNATURE	INTEGER	Categorizes queries that affect the design that Database Designer creates in the same way. Database Designer assigns a signature to each query, weights one query for each signature group, depending on how many queries there are with that signature, and Database Designer considers that query when creating the design.

Example

Add queries to VMART_DESIGN and query the DESIGN_QUERIES table:

```
=> SELECT DESIGNER_ADD_DESIGN_QUERIES('VMART_DESIGN', '/tmp/examples/vmart_queries.sql', 'true');
```

```
DESIGNER_ADD_DESIGN_QUERIES
```

```
-----  
Number of accepted queries          =9  
Number of queries referencing non-design tables =0  
Number of unsupported queries       =0  
Number of illegal queries           =0
```

```
=> \x
```

```
Expanded display is on.
```

```
=> SELECT * FROM V_MONITOR.DESIGN.QUERIES
```

```
-[ RECORD 1 ]-----+-----
```

```
design_id          | 45035996273705090

```

```
...
```

DESIGN_STATUS

Records the progress of a running Database Designer design or history of the last Database Designer design executed by the current user.

Column Name	Data Type	Description
EVENT_TIME	TIMESTAMP	Time when the row recorded the event.
USER_NAME	VARCHAR	Name of the user who ran a design at the time Vertica recorded the session.
DESIGN_NAME	VARCHAR	Name of the user-specified design.

DESIGN_PHASE	VARCHAR	Phase of the design.
PHASE_STEP	VARCHAR	Substep in each design phase
PHASE_STEP_COMPLETE_PERCENT	FLOAT	Progress of current substep in percentage (0-100).
PHASE_COMPLETE_PERCENT	FLOAT	Progress of current design phase in percentage (0-100).

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

Examples

The following example shows the content of the **DESIGN_STATUS** table of a complete Database Designer run:

```
=> SELECT event_time, design_name, design_phase, phase_complete_percent
FROM v_monitor.design_status;
event_time      | design_name | design_phase                | phase_complete_percent
-----+-----+-----+-----
2012-02-14 10:31:20 | design1    | Design started              |
2012-02-14 10:31:21 | design1    | Design in progress: Analyze statistics phase |
2012-02-14 10:31:21 | design1    | Analyzing data statistics    | 33.33
2012-02-14 10:31:22 | design1    | Analyzing data statistics    | 66.67
2012-02-14 10:31:24 | design1    | Analyzing data statistics    | 100
2012-02-14 10:31:25 | design1    | Design in progress: Query optimization phase |
2012-02-14 10:31:25 | design1    | Optimizing query performance | 37.5
2012-02-14 10:31:31 | design1    | Optimizing query performance | 62.5
2012-02-14 10:31:36 | design1    | Optimizing query performance | 75
2012-02-14 10:31:39 | design1    | Optimizing query performance | 87.5
2012-02-14 10:31:41 | design1    | Optimizing query performance | 87.5
2012-02-14 10:31:42 | design1    | Design in progress: Storage optimization phase |
2012-02-14 10:31:44 | design1    | Optimizing storage footprint | 4.17
2012-02-14 10:31:44 | design1    | Optimizing storage footprint | 16.67
2012-02-14 10:32:04 | design1    | Optimizing storage footprint | 29.17
2012-02-14 10:32:04 | design1    | Optimizing storage footprint | 31.25
2012-02-14 10:32:05 | design1    | Optimizing storage footprint | 33.33
2012-02-14 10:32:05 | design1    | Optimizing storage footprint | 35.42
2012-02-14 10:32:05 | design1    | Optimizing storage footprint | 37.5
2012-02-14 10:32:05 | design1    | Optimizing storage footprint | 62.5
2012-02-14 10:32:39 | design1    | Optimizing storage footprint | 87.5
2012-02-14 10:32:39 | design1    | Optimizing storage footprint | 87.5
2012-02-14 10:32:41 | design1    | Optimizing storage footprint | 100
2012-02-14 10:33:12 | design1    | Design completed successfully |
(24 rows)
```

DESIGN_TABLES

Contains information about all the design tables for all the designs for which you are the owner. Each row contains information about a different design table. Vertica creates this table when you run [DESIGNER_CREATE_DESIGN](#).

Column Name	Column Type	Description
DESIGN_NAME	VARCHAR	Unique name that the user specified for the design.
DESIGN_TABLE_ID	INTEGER	Unique ID that Database Designer assigned to the design table.

TABLE_SCHEMA	VARCHAR	Name of the schema that contains the design table. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
TABLE_ID	INTEGER	System object identifier (OID) assigned to the design table.
TABLE_NAME	VARCHAR	Name of the design table.

Example

Add all the tables from the VMart database to the design VMART_DESIGN. This operation populates the **DESIGN_TABLES** table:

```
=> SELECT DESIGNER_ADD_DESIGN_TABLES('VMART_DESIGN','online_sales.*');
DESIGNER_ADD_DESIGN_TABLES
-----
3
(1 row)
=> SELECT DESIGNER_ADD_DESIGN_TABLES('VMART_DESIGN','public.*');
DESIGNER_ADD_DESIGN_TABLES
-----
9
(1 row)
=> SELECT DESIGNER_ADD_DESIGN_TABLES('VMART_DESIGN','store.*');
DESIGNER_ADD_DESIGN_TABLES
-----
3
(1 row)
=> SELECT * FROM DESIGN_TABLES;
design_name | design_table_id | table_schema | table_id | table_name
-----+-----+-----+-----+-----
VMART_DESIGN | 1 | online_sales | 45035996373718754 | online_page_dimension
VMART_DESIGN | 2 | online_sales | 45035996373718758 | call_center_dimension
VMART_DESIGN | 3 | online_sales | 45035996373718762 | online_sales_fact
VMART_DESIGN | 4 | public | 45035996373718766 | customer_dimension
VMART_DESIGN | 5 | public | 45035996373718770 | product_dimension
VMART_DESIGN | 6 | public | 45035996373718774 | promotion_dimension
VMART_DESIGN | 7 | public | 45035996373718778 | date_dimension
VMART_DESIGN | 8 | public | 45035996373718782 | vendor_dimension
VMART_DESIGN | 9 | public | 45035996373718786 | employee_dimension
VMART_DESIGN | 10 | public | 45035996373718822 | shipping_dimension
VMART_DESIGN | 11 | public | 45035996373718826 | warehouse_dimension
VMART_DESIGN | 12 | public | 45035996373718830 | inventory_face
VMART_DESIGN | 13 | store | 45035996373718794 | store_dimension
VMART_DESIGN | 14 | store | 45035996373718798 | store_sales_fact
VMART_DESIGN | 15 | store | 45035996373718812 | store_orders_fact
(15 rows)
```

DESIGNS

Contains information about a Database Designer design. After you create a design and specify certain parameters for Database Designer, [DESIGNER_CREATE_DESIGN](#) creates this table in the **V_MONITOR** schema.

Column Name	Column Type	Description
DESIGN_ID	INTEGER	Unique ID that Database Designer assigns to this design.

DESIGN_NAME	VARCHAR	Name that the user specifies for the design.
KSAFETY_LEVEL	INTEGER	K-safety level for the design. Database Designer assigns a K-safety value of 0 for clusters with 1 or 2 nodes, and assigns a value of 1 for clusters with 3 or more nodes.
OPTIMIZATION_OBJECTIVE	VARCHAR	Name of the optimization objective for the design. Valid values are: <ul style="list-style-type: none"> • QUERY • LOAD • BALANCED (default)
DESIGN_TYPE	VARCHAR	Name of the design type. Valid values are: <ul style="list-style-type: none"> • COMPREHENSIVE (default) • INCREMENTAL
PROPOSE_SUPER_FIRST	BOOLEAN	Specifies to propose superprojections before projections, by default f . If DESIGN_MODE is COMPREHENSIVE , this field has no impact.
DESIGN_AVAILABLE	BOOLEAN	t if the design is currently available, otherwise, f (default).
COLLECTED_STATISTICS	BOOLEAN	t if statistics are to be collected when creating the design, otherwise, f (default).
POPULATE_DESIGN_TABLES_FROM_QUERIES	BOOLEAN	t if you want to populate the design tables from the design queries, otherwise, f (default).
ENCODING_DESIGN	BOOLEAN	t if the design is an encoding optimization design on pre-existing projections, otherwise, f (default).
DEPLOYMENT_PARALLELISM	INTEGER	Number of tables to be deployed in parallel when the design is complete. Default: 0
UNSEGMENTED_PROJECTIONS	BOOLEAN	t if you specify unsegmented projections, otherwise, f (default).
ANALYZE_CORRELATIONS_MODE	INTEGER	Specifies how Database Designer should handle existing column correlations in a design and whether or not Database Designer should reanalyze existing column correlations. <ul style="list-style-type: none"> • 0: (default) Ignore column correlations when creating the design. • 1: Consider the existing correlations in the tables when creating the design. • 2: Analyze column correlations if not previously performed, and consider the column correlations when creating the design. • 3: Analyze all column correlations in the tables and consider them when creating the design, even if they have been analyzed previously.

DIRECTED_QUERY_STATUS

Returns information about executions of directed queries.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node on which the directed query ran.
OID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the specific directed query.

QUERY_NAME	VARCHAR	Directed query's unique identifier, used by statements such as ACTIVATE DIRECTED QUERY .
DIGEST	INTEGER	Hash of the saved query plan data, used by the optimizer to map identical input queries to the same active directed query.
HITS	INTEGER	Number of times this query has been executed since the last reset. Use CLEAR DIRECTED QUERY USAGE to reset this counter to 0.

Privileges

[Superuser](#)

DISK_QUOTA_USAGES

Provides information about schemas and tables that have disk quotas. Schemas and tables without quotas are not included.

Column Name	Data Type	Description
OBJECT_OID	INTEGER	Unique identifier for a schema or table.
OBJECT_NAME	VARCHAR	Name of the schema or table. Table names include the schema prefix.
IS_SCHEMA	BOOLEAN	Whether the object is a schema. If false, the object is a table.
TOTAL_DISK_USAGE_IN_BYTES	INTEGER	Current usage of the object. For information about what is counted, see Disk quotas .
DISK_QUOTA_IN_BYTES	INTEGER	Current quota for the object.

Examples

```
=> SELECT * FROM DISK_QUOTA_USAGES;
  object_oid | object_name | is_schema | total_disk_usage_in_bytes | disk_quota_in_bytes
-----+-----+-----+-----+-----
45035996273705100 | s      | t      |          307 |          10240
45035996273705104 | public.t | f      |           64 |           1024
45035996273705108 | s.t    | f      |          307 |           2048
(3 rows)
```

DISK_RESOURCE_REJECTIONS

Returns requests for resources that are rejected due to disk space shortages. Output is aggregated by both [RESOURCE_TYPE](#) and [REJECTED_REASON](#) to provide more comprehensive information.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
RESOURCE_TYPE	VARCHAR	The resource request requester (example: Temp files).
REJECTED_REASON	VARCHAR	One of the following: <ul style="list-style-type: none"> Insufficient disk space Failed volume
REJECTED_COUNT	INTEGER	Number of times this REJECTED_REASON has been given for this RESOURCE_TYPE .
FIRST_REJECTED_TIMESTAMP	TIMESTAMP	The time of the first rejection for this REJECTED_REASON and RESOURCE_TYPE .
LAST_REJECTED_TIMESTAMP	TIMESTAMP	The time of the most recent rejection for this REJECTED_REASON and RESOURCE_TYPE .
LAST_REJECTED_VALUE	INTEGER	The value of the most recent rejection for this REJECTED_REASON and RESOURCE_TYPE .

See also

- [RESOURCE_REJECTIONS](#)
- [CLEAR_RESOURCE_REJECTIONS](#)

DISK_STORAGE

Returns the amount of disk storage used by the database on each node. Each node can have one or more storage locations, and the locations can be on different disks with separate properties, such as free space, used space, and block size. The information in this system table is useful in determining where data files reside.

All returned values for this system table are in the context of the file system of the host operating system, and are not specific to Vertica-specific space.

The storage usage annotation called CATALOG indicates that the location is used to store the catalog. Each CATALOG location is specified only when creating a new database. You cannot add a CATALOG location annotation using [CREATE LOCATION](#), nor remove an existing CATALOG annotation.

Storage location performance

The performance of a storage location is measured with two values:

- Throughput in MB/sec
- Latency in seeks/sec

These two values are converted to a single number (Speed) with the following formula:

$$\text{read-time} = (1/\text{throughput}) + (1/\text{latency})$$

- *read-time* : Time to read 1MB of data
- *1/ throughput* : Time to read 1MB of data
- *1/ latency* : Time to seek to the data.

A disk is faster than another disk if its *read-time* is less.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node name for which information is listed.
STORAGE_PATH	VARCHAR	Path where the storage location is mounted.
STORAGE_USAGE	VARCHAR	Type of information stored in the location, one of the following: <ul style="list-style-type: none">• DATA : Only data is stored in the location.• TEMP : Only temporary files that are created during loads or queries are stored in the location.• DATA,TEMP : Both types of files are stored in the location.• USER : The storage location can be used by non-dbadmin users, who are granted access to the storage location• CATALOG : The area is used for the Vertica catalog. This usage is set internally and cannot be removed or changed.
RANK	INTEGER	Integer rank assigned to the storage location based on its performance. Ranks are used to create a storage locations on which projections, columns, and partitions are stored on different disks based on predicted or measured access patterns. See Managing storage locations .
THROUGHPUT	INTEGER	Integer that measures a storage location's performance in MB/sec. <i>1/ throughput</i> is the time taken to read 1MB of data.
LATENCY	INTEGER	Integer that measures a storage location's performance in seeks/sec. <i>1/ latency</i> is the time taken to seek to the data.

STORAGE_STATUS	VARCHAR	Status of the storage location, one of the following: <ul style="list-style-type: none"> • active • retired
DISK_BLOCK_SIZE_BYTES	INTEGER	Block size of the disk in bytes
DISK_SPACE_USED_BLOCKS	INTEGER	Number of disk blocks in use
DISK_SPACE_USED_MB	INTEGER	Number of megabytes of disk storage in use
DISK_SPACE_FREE_BLOCKS	INTEGER	Number of free disk blocks available
DISK_SPACE_FREE_MB	INTEGER	Number of megabytes of free storage available
DISK_SPACE_FREE_PERCENT	VARCHAR	Percentage of free disk space remaining

DRAINING_STATUS

Returns the draining status of each node in a database. The table also provides aggregate user session counts and information about the oldest user session connected to each node. For more information about the user sessions connected to a database, see [SESSIONS](#).

Note

If you aren't a superuser, the OLDEST_SESSION columns contain only information about sessions for which you have privileges. Unprivileged users do not see session details, but they do see the node draining status and the user session aggregate count.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node for which information is listed.
SUBCLUSTER_NAME	VARCHAR	Name of the subcluster that contains the node.
IS_DRAINING	BOOLEAN	True if the node is draining; otherwise, false.
COUNT_CLIENT_USER_SESSIONS	INTEGER	Number of user client sessions connected to the node.
OLDEST_SESSION_USER	VARCHAR	Name of the user with the oldest live session connected to the node. NULL if no users are connected.
OLDEST_SESSION_ID	VARCHAR	Identifier associated with OLDEST_SESSION_USER . This is required to close or interrupt a session. NULL if no users are connected.
OLDEST_SESSION_LOGIN_TIMESTAMP	TIMESTAMP	Date and time the OLDEST_SESSION_USER logged into the database. NULL if no users are connected.

ERROR_MESSAGES

Lists system error messages and warnings Vertica encounters while processing queries. Some errors occur when no transaction is in progress, so the transaction identifier or statement identifier columns might return NULL.

Column Name	Data Type	Description
EVENT_TIMESTAMP	TIMESTAMPTZ	Time when the row recorded the event
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information

USER_ID	INTEGER	Identifier of the user who received the error message
USER_NAME	VARCHAR	Name of the user who received the error message when Vertica recorded the session
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
REQUEST_ID	INTEGER	Unique identifier of the query request in the user session
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any; otherwise NULL
STATEMENT_ID	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID , STATEMENT_ID , and REQUEST_ID uniquely identifies a statement within a session.
ERROR_LEVEL	VARCHAR	Severity of the error, one of the following: <ul style="list-style-type: none"> • LOG • INFO • NOTICE • WARNING • ERROR • ROLLBACK • INTERNAL • FATAL • PANIC
ERROR_CODE	INTEGER	Error code that Vertica reports
MESSAGE	VARCHAR	Textual output of the error message
DETAIL	VARCHAR	Additional information about the error message, in greater detail
HINT	VARCHAR	Actionable hint about the error. For example: HINT: Set the locale in this session to en_US@collation=binary using the command "\locale en_US@collation=binary"

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

EVENT_CONFIGURATIONS

Monitors the configuration of events.

Column Name	Data Type	Description
EVENT_ID	VARCHAR	The name of the event.
EVENT_DELIVERY_CHANNELS	VARCHAR	The delivery channel on which the event occurred.

EXECUTION_ENGINE_PROFILES

Provides profiling information about runtime query execution. The hierarchy of IDs, from highest level to actual execution, is:

- **PATH_ID**

- [BASEPLAN_ID](#)
- [LOCALPLAN_ID](#)
- [OPERATOR_ID](#)

Counters (output from the [COUNTER_NAME](#) column) are collected for each actual Execution Engine (EE) operator instance.

The following columns combine to form a unique key:

- [TRANSACTION_ID](#)
- [STATEMENT_ID](#)
- [NODE_NAME](#)
- [OPERATOR_ID](#)
- [COUNTER_NAME](#)
- [COUNTER_TAG](#)

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node name for which information is listed.
USER_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the user.
USER_NAME	VARCHAR	User name for which query profile information is listed.
SESSION_ID	VARCHAR	Identifier of the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session if any; otherwise NULL .
STATEMENT_ID	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed.
OPERATOR_NAME	VARCHAR	Name of the Execution Engine (EE) component; for example, NetworkSend .
OPERATOR_ID	INTEGER	Identifier assigned by the EE operator instance that performs the work. OPERATOR_ID is different from LOCALPLAN_ID because each logical operator, such as Scan , may be executed by multiple threads concurrently. Each thread operates on a different operator instance, which has its own ID.
BASEPLAN_ID	INTEGER	Assigned by the optimizer on the initiator to EE operators in the original base (EXPLAIN) plan. Each EE operator in the base plan gets a unique ID.
PATH_ID	INTEGER	Identifier that Vertica assigns to a query operation or <i>path</i> ; for example to a logical grouping operation that might be performed by multiple execution engine operators. For each path, the same PATH ID is shared between the query plan (using EXPLAIN output) and in error messages that refer to joins.
LOCALPLAN_ID	INTEGER	Identifier assigned by each local executor while preparing for plan execution (local planning). Some operators in the base plan, such as the Root operator, which is connected to the client, do not run on all nodes. Similarly, certain operators, such as ExprEval , are added and removed during local planning due to implementation details.
ACTIVITY_ID	INTEGER	Identifier of the plan activity.
RESOURCE_ID	INTEGER	Identifier of the plan resource.
COUNTER_NAME	VARCHAR	Name of the counter (see Counter Names below). The counter counts events for one statement.

COUNTER_TAG	VARCHAR	String that uniquely identifies the counter for operators that might need to distinguish between different instances. For example, COUNTER_TAG is used to identify to which of the node bytes are being sent to or received from the NetworkSend operator.
COUNTER_VALUE	INTEGER	Value of the counter.
IS_EXECUTING	BOOLEAN	Indicates whether the profile is active or completed.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

Counter names

The value of **COUNTER_NAME** can be any of the following:

active threads

A counter of the LoadUnion operator, indicates the number of input threads (Load operators) that are currently processing input.

blocks analyzed by SIPS expression

Number of data blocks (for scan operations) or files (for load operations) analyzed by SIPS expression.

blocks filtered by SIPS expression

Number of data blocks (for scan operations) or files (for load operations) filtered by SIPS expression.

blocks filtered by SIPS value lists

Number of data blocks (for scan operations) or files (for load operations) filtered by SIPS sorted value lists.

buffers spilled

[**NetworkSend**] Buffers spilled to disk by **NetworkSend**.

bytes read from disk

[**Scan**] Amount of data read (locally or remotely) from ROS containers on disk.

bytes read from disk cache

[**Scan**] Amount of data [read from cache](#).

bytes received

Number of bytes received over the network for query execution.

bytes sent

[**NetworkSend**] Size of data after encoding and compression sent over the network (actual network bytes).

bytes spilled

[**NetworkSend**] Bytes spilled to disk by **NetworkSend**.

bytes total

[**SendFiles**] (recover-by-container plan): Total number of bytes to send/receive.

cached storages cumulative size (bytes)

[**StorageMerge**] Total amount of temp space used by operator for [caching](#).

cached storages current size (bytes)

[**StorageMerge**] Current amount of temp space used for [caching](#).

cached storages peak size (bytes)

[**StorageMerge**] Peak amount of temp space an operator used for [caching](#).

clock time (µs)

Real-time clock time spent processing the query, in microseconds.

clock time (µs) of UDChunker

Real-time clock time spent in the UDChunker phase of a load operation, in microseconds. Use the **COUNTER_TAG** column to distinguish among load sources.

clock time (µs) of UDFilter(s)

Real-time clock time spent in all UDFilter phases of a load operation, in microseconds. Use the **COUNTER_TAG** column to distinguish among load sources.

clock time (µs) of UDParse

Real-time clock time spent in the UDParse phase of a load operation, in microseconds. Use the **COUNTER_TAG** column to distinguish among

load sources.

clock time (μ s) of UDSOURCE

Real-time clock time spent in the UDSOURCE phase of a load operation, in microseconds. Use the COUNTER_TAG column to distinguish among load sources.

completed merge phases

Number of merge phases already completed by an [LSort](#) or [DataTarget](#) operator. Compare to the [total merge phases](#) . Variants on this value include [join inner completed merge phases](#) .

cumulative size of raw temp data (bytes)

Total amount of temporary data the operator has written to files. Compare to [cumulative size of temp files \(bytes\)](#) to understand impact of encoding and compression in an externalizing operator. Variants on this value include [join inner cumulative size of raw temp files \(bytes\)](#) .

cumulative size of temp files (bytes)

For externalizing operators only, the total number of encoded and compressed temp data the operator has written to files. A sort operator might go through multiple merge phases, where at each pass sorted chunks of data are merged into fewer chunks. This counter remembers the cumulative size of all temp files past and present. Variants on this value include [join inner cumulative size of temp files \(bytes\)](#) .

current allocated rid memory (bytes)

Per-rid memory tracking: current allocation amount under this rid.

current file handles

Number of files open.

current memory allocations (count)

Number of actual allocator calls made.

current memory capacity (bytes)

Amount of system memory held, which includes chunks that are only partially consumed.

current memory overhead (bytes)

Memory consumed, for example, by debug headers. (Normally no overhead.)

current memory padding (bytes)

Memory padding for free list tiers (2^n bytes).

current memory requested (bytes)

Memory actually requested by the caller.

current size of temp files (bytes)

For externalizing operators only, the current size of the encoded and compressed temp data that the operator has written to files. Variants on this value include [join inner current size of temp files \(bytes\)](#) .

current threads

Unused.

current unbalanced memory allocations (count)

current unbalanced memory capacity (bytes)

current unbalanced memory overhead (bytes)

current unbalanced memory requested (bytes)

Pooled version of "current memory XXX" counters.

distinct value estimation time (μ s)

[\[Analyze Statistics\]](#) Time (in microseconds) spent to estimate number of distinct values from the sample after data is read off disk and into the statistical sample.

encoded bytes received

[\[NetworkRecv\]](#) Size of received data after decompressed (but still encoded) received over the network.

encoded bytes sent

[\[NetworkSend\]](#) Size of data sent over the network after encoding.

end time

Time (timestamp) when Vertica stopped processing the operation

estimated rows produced

Number of rows that the optimizer estimated would be produced. See [rows produced](#) for the actual number of rows that are produced.

exceptions cumulative size of raw temp data (bytes)

exceptions rows cumulative size of temp files (bytes)

exceptions rows current size of temp files (bytes)

Counters that store the total or current size of exception data.

execution time (µs)

CPU clock time spent processing the query, in microseconds.

fast aggregated rows

Number of rows being processed by fast aggregations in the hash groupby operator (no group/aggregation).

files completed

Relevant only to **SendFiles/RecvFiles** operators (that is, recover-by-container plan) number of files sent/received.

files total

Relevant only to **SendFiles/RecvFiles** operators (that is, recover-by-container plan) total number of files to send/receive.

Hadoop FS bytes read through native libhdfs++ client

[Scan, Load] Number of bytes read from an **hdfs** source (using libhdfs++).

Hadoop FS bytes read through webhdfs

[Scan, Load] Number of bytes read from a **webhdfs** source.

Hadoop FS bytes written through webhdfs

[DataTarget] Number of bytes written to **webhdfs** storage.

Hadoop FS hdfs:// operations that used native libhdfs++ calls

[Scan, Load, DataTarget] Number of times Vertica opened a file with an hdfs:// URL and used the native hdfs protocol

Hadoop FS hdfs:// operations that used webhdfs calls

[Scan, Load, DataTarget] Number of times Vertica opened a file with an hdfs:// URL and used the webhdfs protocol

Hadoop FS read operations through native libhdfs++ client failure count

[Scan, Load] Number of times a native libhdfs++ source encountered an error and gave up

Hadoop FS read operations through native libhdfs++ client retry count

[Scan, Load] Number of times a native libhdfs++ source encountered an error and retried

Hadoop FS read operations through webhdfs failure count

[Scan, Load] Number of times a webhdfs source encountered an error and gave up

Hadoop FS read operations through webhdfs retry count

[Scan, Load] Number of times a webhdfs source encountered an error and retried

Hadoop FS write operations through webhdfs failure count

[DataTarget] Number of times a webhdfs write encountered an error and gave up

Hadoop FS write operations through webhdfs retry count

[DataTarget] Number of times a webhdfs write encountered an error and retried

histogram creation time(µs)

[Analyze Statistics] Time spent estimating the number of distinct values from the sample after data is read off disk and into the statistical sample.

initialization time (µs)

Time in microseconds spent initializing an operator during the CompilePlan step of query processing. For example, initialization time could include the time spent compiling expressions and gathering resources.

input queue wait (µs)

Time in microseconds that an operator spends waiting for upstream operators.

input rows

Actual number of rows that were read into the operator.

input size (bytes)

Total number of bytes of the **Load** operator's input source, where NULL is unknown (read from FIFO).

inputs processed

Number of sources processed by a Load operator.

intermediate rows to process

Number of rows to process in a phase as determined by a sort or **GROUP BY (HASH)** .

join inner clock time (µs)

Real clock time spent on processing the inner input of the join operator.

join inner completed mergephases

join inner cumulative size of raw temp data (bytes)

join inner cumulative size of temp files (bytes)

join inner current size of temp files (bytes)

See the [completed merge phases](#) counter.

join inner execution time (µs)

The CPU clock time spent on processing the inner input of the join operator.

join inner hash table building time (µs)

Time spent for building the hash table for the inner input of the join operator.

join inner hash table collisions

Number of hash table collisions that occurred when building the hash table for the inner input of the join operator.

join inner hash table entries

Number of hash table entries for the inner input of the join operator.

join inner total merge phases

See the [completed merge phases](#) counter.

join outer clock time (µs)

Real clock time spent on processing the outer input of the join operator (including doing the join).

join outer execution time (µs)

CPU clock time spent on processing the outer input of the join operator (including doing the join).

max sample size (rows)

[\[Analyze Statistics\]](#) Maximum number of rows that will be stored in the statistical sample.

memory reserved (bytes)

Memory reserved by this operator. Deprecated.

network wait (µs)

[\[NetworkSend, NetworkRecv\]](#) Time in microseconds spent waiting on the network.

number of bytes read from persistent storage

Estimated number of bytes read from persistent storage to process this query.

number of bytes read from depot storage

Estimated number of bytes read from the depot to process this query.

number of cancel requests received

Number of cancel requests received (per operator) when cancelling a call to the execution engine.

number of invocations

Number of times a UDSF function was invoked.

number of storage containers opened

[\[Scan\]](#) Number of containers opened by the operator, at least 1. If the scan operator switches containers, this counter increases accordingly.

See [Local caching of storage containers](#) for details.

output queue wait (µs)

Time in microseconds that an operator spends waiting for the output buffer to be consumed by a downstream operator.

peak allocated rid memory (bytes)

Per-rid memory tracking: peak allocation amount under this rid.

peak cooperating threads

Peak number of threads which parsed (in parallel) a single load source, using "cooperative parse." [counter_tag](#) indicates the source when joining with [dc_load_events](#) .

peak file handles

peak memory allocations (count)

peak memory capacity (bytes)

peak memory overhead (bytes)

peak memory padding (bytes)

peak memory requested (bytes)

peak temp space

peak threads**peak unbalanced memory allocations (count)****peak unbalanced memory capacity (bytes)****peak unbalanced memory overhead (bytes)****peak unbalanced memory padding (bytes)****peak unbalanced memory requested (bytes)**

Peak value of the corresponding "current XXX" counters.

portion offset

Offset value of a portion descriptor in an apportioned load. [counter_tag](#) indicates the source when joining with [dc_load_events](#) .

portion size

Size value of a portion descriptor in an apportioned load. [counter_tag](#) indicates the source when joining with [dc_load_events](#) .

producer stall (µs)

[\[NetworkSend\]](#) Time in microseconds spent by [NetworkSend](#) when stalled waiting for network buffers to clear.

producer wait (µs)

[\[NetworkSend\]](#) Time in microseconds spent by the input operator making rows to send.

read (bytes)

Number of bytes read from the input source by the [Load](#) operator.

receive time (µs)

Time in microseconds that a [Recv](#) operator spends reading data from its socket.

rejected data cumulative size of raw temp data (bytes)**rejected data cumulative size of temp files (bytes)****rejected data current size of temp files (bytes)****rejected rows cumulative size of raw temp data (bytes)****rejected rows cumulative size of temp files (bytes)****rejected rows current size of temp files (bytes)**

Counters that store total or current size of rejected row numbers. Are variants of:

- [cumulative size of raw temp data \(bytes\)](#)
- [cumulative size of temp files \(bytes\)](#)
- [current size of temp files \(bytes\)](#)

reserved rid memory (bytes)

Per-rid memory tracking: total memory reservation under this rid.

rle rows produced

Number of physical tuples produced by an operator. Complements the [rows produced](#) counter, which shows the number of logical rows produced by an operator. For example, if a value occurs 1000 rows consecutively and is RLE encoded, it counts as 1000 [rows produced](#) not only 1 [rle rows produced](#) .

ROS blocks bounded

[\[DataTarget\]](#) Number of ROS blocks created, due to boundary alignment with RLE prefix columns, when an EE DataTarget operator is writing to ROS containers.

ROS blocks encoded

[\[DataTarget\]](#) Number of ROS blocks created when an EE DataTarget operator is writing to ROS containers.

ROS bytes written

[\[DataTarget\]](#) Number of bytes written to disk when an EE DataTarget operator is writing to ROS containers.

rows added by predicate analysis

Number of rows in the query results that were added without individual evaluation, based on the predicate and range of possible results in a block.

rows filtered by SIPS expression

Number of rows filtered by the SIPS expression from the Scan operator.

rows filtered by query predicate

Number of rows excluded from query results because they failed a condition (predicate), for example in a WHERE clause.

rows in sample

[Analyze Statistics] Actual number of rows that will be stored in the statistical sample.

rows output by sort

[DataTarget] Number of rows sorted when an EE DataTarget operator is writing to ROS containers.

rows processed

[DataSource] Number of rows processed when an EE DataSource operator is reading from ROS containers.

rows processed by SIPs expression

Number of rows processed by the SIPs expression in the Scan operator.

rows produced

Number of logical rows produced by an operator. See also the [rle rows produced](#) counter.

rows pruned by query predicates

Number of rows discarded from query results because, based on predicates and value ranges, no row in the block could satisfy the predicate.

rows pruned by valindex

[DataSource] Number of rows it skips direct scanning with help of valindex when an EE DataSource operator is writing to ROS containers. This counter's value is not greater than "rows processed" counter.

rows read in sort

See the counter [total rows read in sort](#) .

rows received

[NetworkRecv] Number of received sent over the network.

rows rejected

Number of rows rejected by the [Load](#) operator.

rows sent

[NetworkSend] Number of rows sent over the network.

rows to process

Total number of rows to be processed in a phase, based upon the number of table accesses. Compare to the counter, [rows processed](#) . Divide the rows processed value by the rows to process value for percent completion.

rows written in join sort

Total number of rows being read out of the sort facility in Join.

rows written in sort

Number of rows read out of the sort by the SortManager. This counter and the counter total rows read from sort are typically equal.

send time (µs)

Time in microseconds that a [Send](#) operator spends writing data to its socket.

start time

Time (timestamp) when Vertica started to process the operation.

total merge phases

Number of merge phases an [LSort](#) or [DataTarget](#) operator must complete to finish sorting its data. NULL until the operator can compute this value (all data must first be ingested by the operator). Variants on this value include [join inner total merge phases](#) .

total rows read in join sort

Total number of rows being put into the sort facility in Join.

total rows read in sort total

Total number of rows ingested into the sort by the SortManager. This counter and the counter rows written in sort are typically equal.

total rows written in sort

See the counter, [rows written in sort](#) .

total sources

Total number of distinct input sources processed in a load.

unpacked (bytes)

Number of bytes produced by a compressed source in a load (for example, for a gzip file, the size of the file when decompressed).

wait clock time (µs)

StorageUnion wait time in microseconds.

written rows

[DataTarget] Number of rows written when an EE DataTarget operator writes to ROS containers

Examples

The two queries below show the contents of the EXECUTION_ENGINE_PROFILES table:

```
=> SELECT operator_name, operator_id, counter_name, counter_value
      FROM EXECUTION_ENGINE_PROFILES WHERE operator_name = 'Scan'
      ORDER BY counter_value DESC;
```

operator_name	operator_id	counter_name	counter_value
Scan	20	end time	1559929719983785
Scan	20	start time	1559929719983737
Scan	18	end time	1559929719983358
Scan	18	start time	1559929718069860
Scan	16	end time	1559929718069319
Scan	16	start time	1559929718069188
Scan	14	end time	1559929718068611
Scan	18	end time	1559929717579145
Scan	18	start time	1559929717579083
Scan	16	end time	1559929717578509
Scan	18	end time	1559929717379346
Scan	18	start time	1559929717379307
Scan	16	end time	1559929717378879
Scan	16	start time	1559929716894312
Scan	14	end time	1559929716893599
Scan	14	start time	1559929716893501
Scan	12	end time	1559929716892721
Scan	16	start time	1559929716666110

...

```
=> SELECT DISTINCT counter_name FROM execution_engine_profiles;
      counter_name
```

reserved rid memory (bytes)
rows filtered by SIPs expression

- [QUERY_CONSUMPTION](#)

EXTERNAL_TABLE_DETAILS

Returns the amount of disk storage used by the source files backing external tables in the database. The information in this system table is useful in determining Hadoop license compliance.

When computing the size of an external table, Vertica counts all data found in the location specified by the COPY FROM clause. If you have a directory that contains ORC and delimited files, for example, and you define your external table with "COPY FROM *" instead of "COPY FROM *.orc", this table includes the size of the delimited files. (You would probably also encounter errors when querying that external table.) When you query this system table Vertica does not validate your table definition; it just uses the path to find files to report.

Restrict your queries to filter by schema, table, or format to avoid expensive queries. Vertica calculates the values in this table at query time, so "SELECT *" accesses every input file contributing to every external table.

Predicates in queries may use only the TABLE_SCHEMA, TABLE_NAME, and SOURCE_FORMAT columns. Values are case-sensitive.

This table includes TEMP external tables.

This table reports only data that the current user can read. To include all the data backing external tables, either query this table as a user that has access to all HDFS data or use a session delegation token that grants this access. For more information about using delegation tokens, see [Accessing kerberized HDFS data](#).

Column Name	Data Type	Description
SCHEMA_OID	INTEGER	The unique identification number of the schema in which the external table resides.
TABLE_NAMESPACE	VARCHAR	For Eon Mode databases, namespace that contains the external table.
TABLE_SCHEMA	VARCHAR	The name of the schema in which the external table resides. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
TABLE_OID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies the table.

TABLE_NAME	VARCHAR	The table name.
SOURCE_FORMAT	VARCHAR	The data format the source file used, one of ORC, PARQUET, DELIMITED, USER DEFINED, or NULL if another format.
TOTAL_FILE_COUNT	INTEGER	The number of files used to store this table's data, expanding globs and partitions.
TOTAL_FILE_SIZE_BYTES	INTEGER	Total number of bytes used by all of this table's data files.
SOURCE_STATEMENT	VARCHAR	The load statement used to copy data from the source files.
FILE_ACCESS_ERROR	VARCHAR	The access error returned during the source statement. NULL, if there was no access error during the source statement.

HIVE_CUSTOM_PARTITIONS_ACCESSED

This table provides information about all custom locations for Hive partition data that Vertica has accessed. It applies when Hive uses a non-default location for partition data, the HCatalog Connector is used to access that data, and the [CREATE HCATALOG SCHEMA](#) statement for the schema sets the CUSTOM_PARTITIONS parameter.

Column Name	Data Type	Description
ACCESS_TIME	TIMESTAMPTZ	Time when Vertica accessed the partition data.
ACCESS_NODE	VARCHAR(128)	Name of the node that performed the access.
TRANSACTION_ID	INTEGER	Identifier for the query that produced the access.
FILESYSTEM	VARCHAR(128)	File system of the partition data. This value is the scheme portion of the URL.
AUTHORITY	VARCHAR(128)	If the file system is HDFS, this value is the nameservice. If the file system is S3, it is the name of the bucket.
URL	VARCHAR(6400)	Full path to the partition.

Privileges

No explicit permissions are required; however, users see only the records that correspond to schemas they have permissions to access.

HOST_RESOURCES

Provides a snapshot of the node. This is useful for regularly polling the node with automated tools or scripts.

Column Name	Data Type	Description
HOST_NAME	VARCHAR	The host name for which information is listed.
OPEN_FILES_LIMIT	INTEGER	The maximum number of files that can be open at one time on the node.
THREADS_LIMIT	INTEGER	The maximum number of threads that can coexist on the node.
CORE_FILE_LIMIT_MAX_SIZE_BYTES	INTEGER	The maximum core file size allowed on the node.
PROCESSOR_COUNT	INTEGER	The number of system processors.
PROCESSOR_CORE_COUNT	INTEGER	The number of processor cores in the system.

PROCESSOR_DESCRIPTION	VARCHAR	A description of the processor. For example: Inter(R) Core(TM)2 Duo CPU T8100 @2.10GHz (1 row)
OPENED_FILE_COUNT	INTEGER	The total number of open files on the node.
OPENED_SOCKET_COUNT	INTEGER	The total number of open sockets on the node.
OPENED_NONFILE_NONSOCKET_COUNT	INTEGER	The total number of <i>other</i> file descriptions open in which 'other' could be a directory or FIFO. It is not an open file or socket.
TOTAL_MEMORY_BYTES	INTEGER	The total amount of physical RAM, in bytes, available on the system.
TOTAL_MEMORY_FREE_BYTES	INTEGER	The amount of physical RAM, in bytes, left unused by the system.
TOTAL_BUFFER_MEMORY_BYTES	INTEGER	The amount of physical RAM, in bytes, used for file buffers on the system
TOTAL_MEMORY_CACHE_BYTES	INTEGER	The amount of physical RAM, in bytes, used as cache memory on the system.
TOTAL_SWAP_MEMORY_BYTES	INTEGER	The total amount of swap memory available, in bytes, on the system.
TOTAL_SWAP_MEMORY_FREE_BYTES	INTEGER	The total amount of swap memory free, in bytes, on the system.
DISK_SPACE_FREE_MB	INTEGER	The free disk space available, in megabytes, for all storage location file systems (data directories).
DISK_SPACE_USED_MB	INTEGER	The disk space used, in megabytes, for all storage location file systems.
DISK_SPACE_TOTAL_MB	INTEGER	The total free disk space available, in megabytes, for all storage location file systems.

IO_USAGE

Provides disk I/O bandwidth usage history for the system.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
START_TIME	TIMESTAMP	Beginning of history interval.
END_TIME	TIMESTAMP	End of history interval.
READ_KBYTES_PER_SEC	FLOAT	Counter history of the number of bytes read measured in kilobytes per second.
WRITTEN_KBYTES_PER_SEC	FLOAT	Counter history of the number of bytes written measured in kilobytes per second.

Privileges

Superuser

LDAP_LINK_DRYRUN_EVENTS

Collects the results from LDAP dry run meta-functions:

- [LDAP_LINK_DRYRUN_CONNECT](#)
- [LDAP_LINK_DRYRUN_SEARCH](#)
- [LDAP_LINK_DRYRUN_SYNC](#)

For detailed instructions on using these meta-functions, see [Configuring LDAP link with dry runs](#).

Column Name	Data Type	Description
EVENT_TIMESTAMP	TIMESTAMP	The date and time of an LDAP server and Vertica LDAP Link interaction.
NODE_NAME	VARCHAR	The clerk node.
SESSION_ID	VARCHAR	The identification number of the LDAP Link session.
USER_ID	INTEGER	The unique, system-generated user identification number.
USER_NAME	VARCHAR	The name of the user for which the information is listed.
TRANSACTION_ID	INTEGER	The system-generated transaction identification number. Is NULL if a transaction id does not exist.
EVENT_TYPE	VARCHAR	The result of a dry run.
ENTRY_NAME	VARCHAR	The name of the object on which the event occurred, if applicable. For example, the event SYNC-STARTED does not use an object.
ROLE_NAME	VARCHAR	The name of a role.
LDAPURIHASH	INTEGER	The URI hash number for the LDAP user.
LDAP_URI	VARCHAR	The URI for the LDAP server.
BIND_DN	VARCHAR	The Distinguished Name used for the dry run bind.
FILTER_GROUP	VARCHAR	The group attribute passed to the dry run meta-functions as LDAPLinkFilterGroup.
FILTER_USER	VARCHAR	The user attribute passed to the dry run meta-functions as LDAPLinkFilterUser.

LINK_SCOPE	VARCHAR	The DN level to replicate, passed to the dry run meta-functions as LDAPLinkScope.
SEARCH_BASE	VARCHAR	The DN level from which LDAP Link begins the search, passed to the dry run meta-functions as LDAPLinkSearchBase.
GROUP_MEMBER	VARCHAR	Identifies the members of an LDAP group, passed to the dry run meta-functions as LDAPLinkGroupMembers.
GROUP_NAME	VARCHAR	The LDAP field to use when creating a role name in Vertica, passed to the dry run meta-functions as LDAPLinkGroupName.
LDAP_USER_NAME	VARCHAR	The attribute that identifies individual users, passed to the dry run meta-functions as LDAPLinkUserName.
TLS_REC_CERT	VARCHAR	The connection policy used for the dry run connection for certificate management. This connection policy is set through the LDAPLink TLS Configuration .
TLS_CA_CERT	VARCHAR	The CA certificate used for the dry run connection specified by the LDAPLink TLS Configuration .

LDAP_LINK_EVENTS

Monitors events that occurred during an LDAP Link synchronization.

Column Name	Data Type	Description
EVENT_TIMESTAMP	TIMESTAMP	The time the event occurred.
NODE_NAME	VARCHAR	The name of the node or nodes for which the information is listed.
SESSION_ID	VARCHAR	The identification number of the LDAP Link session.
USER_ID	INTEGER	The unique, system-generated user identification number.
USER_NAME	VARCHAR	The name of the user for which the information is listed.
TRANSACTION_ID	INTEGER	The system-generated transaction identification number. Is NULL if a transaction id does not exist.
EVENT_TYPE	VARCHAR	The type of event being logged, for example USER_CREATED and PROCESSING_STARTED.
ENTRY_NAME	VARCHAR	The name of the object on which the event occurred, if applicable. For example, the event SYNC-STARTED does not use an object.
ENTRY_OID	INTEGER	The unique identification number for the object on which the event occurred, if applicable.
LDAPURIHASH	INTEGER	The URI hash number for the LDAP user.

LOAD_SOURCES

Like [LOAD_STREAMS](#), monitors active and historical load metrics on each node. The LOAD_SOURCES table breaks information down by source and portion. Rows appear in this table only for COPY operations that are profiled or run for more than one second. LOAD_SOURCES does not record information about loads from ORC or Parquet files or COPY LOCAL.

A row is added to this table when the loading of a source or portion begins. Column values related to the progress of the load are updated during the load operation.

Columns that uniquely identify the load source (the various ID and name columns) and column IS_EXECUTING always have non-NULL values.

Column Name	Data Type	Description
-------------	-----------	-------------

SESSION_ID	VARCHAR	Identifier of the session for which Vertica captures load stream information. This identifier is unique within the cluster for the current session but can be reused in a subsequent session.
TRANSACTION_ID	INTEGER	Identifier for the transaction within a session. If a session is active, but no transaction has begun, this value is NULL.
STATEMENT_ID	INTEGER	Unique numeric ID for the currently running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID uniquely identifies a statement within a session.
STREAM_NAME	VARCHAR	<p>Load stream identifier. If the user does not supply a specific name, the STREAM_NAME default value is <i>tablename - ID</i>, where:</p> <ul style="list-style-type: none"> <i>tablename</i> is the table into which data is being loaded. <i>ID</i> is an integer value. <i>ID</i> is guaranteed to be unique within the current session on a node. <p>This system table includes stream names for every COPY statement that takes more than 1 second to run. The 1-second duration includes the time to plan and execute the statement.</p>
SCHEMA_NAME	VARCHAR	Schema name for which load information is listed. Lets you identify two streams that are targeted at tables with the same name in different schemas. NULL, if selecting from an external table.
TABLE_OID	INTEGER	A unique numeric ID assigned by the Vertica catalog that identifies the table. NULL, if selecting from an external table.
TABLE_NAME	VARCHAR	Name of the table being loaded. NULL, if selecting from an external table.
NODE_NAME	VARCHAR	Name of the node loading the source.
SOURCE_NAME	VARCHAR	<ul style="list-style-type: none"> Full file path if copying from a file. Value returned by <code>getUri()</code> if the source is a user-defined source. STDIN if loading from standard input.
PORTION_OFFSET	INTEGER	Offset of the source portion, or NULL if not apportioned.
PORTION_SIZE	INTEGER	Size of the source portion, or NULL if not apportioned.
IS_EXECUTING	BOOLEAN	Whether this source is currently being parsed, where <i>t</i> is true and <i>f</i> is false.
READ_BYTES	INTEGER	Number of bytes read from the input file.
ROWS_PRODUCED	INTEGER	Number of rows produced from parsing the source.
ROWS_REJECTED	INTEGER	Number of rows rejected from parsing the source. If CopyFaultTolerantExpressions is true, also includes rows rejected during expression evaluation.
INPUT_SIZE	INTEGER	Size of the input source in bytes, or NULL for unsized sources. For UDSources, this value is the value returned by <code>getSize()</code> .
PARSE_COMPLETE_PERCENT	INTEGER	Percent of rows from the input file that have been parsed.
FAILURE_REASON	VARCHAR	<p>Indicates cause for failure, one of the following:</p> <ul style="list-style-type: none"> Load source aborted, error message indicates cause. For example: <code>COPY: Could not open file [<i>filename</i>] for reading; Permission denied</code> Load canceled, displays error message: <code>Statement interrupted</code> <p>In all other cases, set to NULL.</p>

PEAK_COOPERATING_THREADS	INTEGER	The peak number of threads parsing this source in parallel.
CLOCK_TIME_SOURCE	INTEGER	Displays in real-time how many microseconds (μ s) have been consumed by the UDSource phase of a load operation.
CLOCK_TIME_FILTERS	INTEGER	Displays in real-time how many microseconds (μ s) have been consumed by all UDFilter phases of a load operation.
CLOCK_TIME_CHUNKER	INTEGER	Displays in real-time how many microseconds (μ s) have been consumed by the UDChunker phase of a load operation.
CLOCK_TIME_PARSER	INTEGER	Displays in real-time how many microseconds (μ s) have been consumed by the UDParser phase of a load operation.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

LOAD_STREAMS

Monitors active and historical load metrics for load streams. This is useful for obtaining statistics about how many records got loaded and rejected from the previous load. Vertica maintains system table metrics until they reach a designated size quota (in kilobytes). This quota is set through internal processes, which you cannot set or view directly.

Column Name	Data Type	Description
SESSION_ID	VARCHAR	Identifier of the session for which Vertica captures load stream information. This identifier is unique within the cluster for the current session, but can be reused in a subsequent session.
TRANSACTION_ID	INTEGER	Identifier for the transaction within a session. If a session is active but no transaction has begun, this is NULL.
STATEMENT_ID	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID uniquely identifies a statement within a session.
STREAM_NAME	VARCHAR	Load stream identifier. If the user does not supply a specific name, the STREAM_NAME default value is: <i>tablename-ID</i> where <i>tablename</i> is the table into which data is being loaded, and <i>ID</i> is an integer value, guaranteed to be unique with the current session on a node. This system table includes stream names for every COPY statement that takes more than 1-second to run. The 1-second duration includes the time to plan and execute the statement.
SCHEMA_NAME	VARCHAR	Schema name for which load stream information is listed. Lets you identify two streams that are targeted at tables with the same name in different schemas
TABLE_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the table.
TABLE_NAME	VARCHAR	Name of the table being loaded.
LOAD_START	VARCHAR	Linux system time when the load started.
LOAD_DURATION_MS	NUMERIC(54,0)	Duration of the load stream in milliseconds.
IS_EXECUTING	BOOLEAN	Indicates whether the load is executing, where <i>t</i> is true and <i>f</i> is false.
ACCEPTED_ROW_COUNT	INTEGER	Number of rows loaded.

REJECTED_ROW_COUNT	INTEGER	Number of rows rejected.
READ_BYTES	INTEGER	Number of bytes read from the input file.
INPUT_FILE_SIZE_BYTES	INTEGER	Size of the input file in bytes. Note: When using STDIN as input, the input file size is zero (0).
PARSE_COMPLETE_PERCENT	INTEGER	Percent of rows from the input file that have been parsed.
UNSORTED_ROW_COUNT	INTEGER	Cumulative number rows not sorted across all projections. Note: UNSORTED_ROW_COUNT could be greater than ACCEPTED_ROW_COUNT because data is copied and sorted for every projection in the target table.
SORTED_ROW_COUNT	INTEGER	Cumulative number of rows sorted across all projections.
SORT_COMPLETE_PERCENT	INTEGER	Percent of rows from the input file that have been sorted.

Privileges

If you have the SYSMONITOR role or are the dbadmin user, this table shows all loads. Otherwise it shows only your loads.

LOCK_USAGE

Provides aggregate information about lock requests, releases, and attempts, such as wait time/count and hold time/count. Vertica records:

- Lock attempts at the end of the locking process
- Lock releases after lock attempts are released

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information on which lock interaction occurs.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
OBJECT_NAME	VARCHAR	Name of object being locked; can be a table or an internal structure (projection, global catalog, or local catalog).
MODE	VARCHAR	Intended operations of the transaction. Otherwise, this value is NONE. For a list of lock modes and compatibility, see Lock modes .
AVG_HOLD_TIME	INTERVAL	Average time (measured in intervals) that Vertica holds a lock.
MAX_HOLD_TIME	INTERVAL	Maximum time (measured in intervals) that Vertica holds a lock.
HOLD_COUNT	INTEGER	Total number of times the lock was granted in the given mode.
AVG_WAIT_TIME	INTERVAL	Average time (measured in intervals) that Vertica waits on the lock.
MAX_WAIT_TIME	INTERVAL	Maximum time (measured in intervals) that Vertica waits on a lock.
WAIT_COUNT	INTEGER	Total number of times lock was unavailable at the time it was first requested.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

LOCKS

Monitors lock grants and requests for all nodes. If no locks are active, a query on LOCKS returns no rows.

Column Name	Data Type	Description
NODE_NAMES	VARCHAR	Comma-separated list of nodes where lock interaction occurs. A transaction can have the same lock in the same mode in the same scope on multiple nodes. However, the transaction gets only one line in the table.
OBJECT_NAME	VARCHAR	Name of object to lock, either a table or an internal structure: projection, global catalog, or local catalog.
OBJECT_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog that identifies the object to lock.
TRANSACTION_ID	VARCHAR	Identifier of transaction within the session, if any; otherwise NULL . Transaction IDs can be used to join other system tables.
TRANSACTION_DESCRIPTION	VARCHAR	Identifier of transaction and associated description. Typically, this query caused the transaction's creation.
LOCK_MODE	VARCHAR	Transaction's lock type .
LOCK_SCOPE	VARCHAR	Expected duration of the lock after it is granted. Before the lock is granted, Vertica lists the scope as REQUESTED . After a lock is granted, its scope is set to one of the following: <ul style="list-style-type: none"> • STATEMENT_LOCALPLAN • STATEMENT_COMPILE • STATEMENT_EXECUTE • TRANSACTION_POSTCOMMIT • TRANSACTION All scopes other than TRANSACTION are transient and used only as part of normal query processing.
REQUEST_TIMESTAMP	TIMESTAMP	Time when the transaction began waiting on the lock.
GRANT_TIMESTAMP	TIMESTAMP	Time the transaction acquired or upgraded the lock: <ul style="list-style-type: none"> • Return values are NULL until the grant occurs. • If the grant occurs immediately, values might be the same as REQUEST_TIMESTAMP .

LOG_ROTATE_EVENTS

Lists the rotation events from [DO_LOGROTATE_LOCAL](#).

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node from which logs were rotated.
SUCCESS	BOOLEAN	Whether the call to DO_LOGROTATE_LOCAL succeeded.
MAX_SIZE	INTEGER	The size, in bytes, set for LogRotateMaxSize .
MAX_AGE	INTEGER	The age, in days, set for LogRotateMaxAge .
LOG_FILE	VARCHAR	The path of the original log file.
NEED_ROTATION	BOOLEAN	Whether the LOG_FILE needed to be rotated.
MESSAGE	VARCHAR	The actions performed by DO_LOGROTATE_LOCAL for LOG_FILE .

Example

To view all successful rotation events:

```
-> SELECT * FROM log_rotate_events WHERE need_rotation='t' AND success='t';
{ RECORD 1 }+-----+
-----+
node_name | v_vmart_node0001
success   | t
max_size  | 104857600
max_age   | 7
log_file  | /scratch_b/VMart/v_vmart_node0001_catalog/vertica.log
need_rotation | t
message   | /scratch_b/VMart/v_vmart_node0001_catalog/vertica.log was rotated to /scratch_b/VMart/v_vmart_node0001_catalog/vertica.log.2023-12-08-15
{ RECORD 2 }+-----+
-----+
node_name | v_vmart_node0001
success   | t
max_size  | 104857600
max_age   | 7
log_file  | /scratch_b/VMart/v_vmart_node0001_catalog/UDxLogs/UDxFencedProcesses.log
need_rotation | t
message   | /scratch_b/VMart/v_vmart_node0001_catalog/UDxLogs/UDxFencedProcesses.log was rotated to /scratch_b/VMart/v_vmart_node0001_catalog/UDxLogs/UDxFencedProcesses.log.2023-12-08-15
```

LOGIN_FAILURES

This system table lists failures for each failed login attempt. This information helps you determine if a user is having difficulty getting into the database or identify a possible intrusion attempt.

Column Name	Data Type	Description
LOGIN_TIMESTAMP	TIMESTAMPTZ	Time when Vertica recorded the login.
DATABASE_NAME	VARCHAR	The name of the database for the login attempt.
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
USER_NAME	VARCHAR	Name of the user whose login failed at the time Vertica recorded the session.

CLIENT_HOSTNAME	VARCHAR	Host name and port of the TCP socket from which the client connection was made. NULL if the session is internal.
CLIENT_PID	INTEGER	Identifier of the client process that issued this connection. In some cases, the client process is on a different machine from the server.
CLIENT_VERSION	VARCHAR	Unused.
CLIENT_OS_USER_NAME	VARCHAR	The name of the user that logged into, or attempted to log into, the database. This is logged even when the login attempt is unsuccessful.
AUTHENTICATION_METHOD	VARCHAR	Name of the authentication method used to validate the client application or user who is trying to connect to the server using the database user name provided Valid values: <ul style="list-style-type: none"> • Trust • Reject • GSS • LDAP • Ident • Hash • TLS See Configuring client authentication for further information.
CLIENT_AUTHENTICATION_NAME	VARCHAR	Locally created name of the client authentication method.
REASON	VARCHAR	Description of login failure reason. Valid values: <ul style="list-style-type: none"> • INVALID USER • ACCOUNT LOCKED • REJECT • FAILED • INVALID AUTH METHOD • INVALID DATABASE

Privileges

Superuser

MEMORY_EVENTS

Records events related to Vertica memory usage.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node where the event occurred
EVENT_TIME	TIMESTAMPTZ	Event start time
EVENT_TYPE	VARCHAR	Type of event, one of the following: <ul style="list-style-type: none"> • MEMORY_REPORT : The Vertica memory poller created a report on memory usage, for the reason specified in EVENT_REASON . For details, see Memory usage reporting . • MALLOC_TRIM : Vertica ran the glibc function <code>malloc_trim()</code> to reclaim glibc-allocated memory. For details, see Memory trimming .

EVENT_REASON	VARCHAR	Reason for the event—for example, trim threshold was greater than <i>RSS / available-memory</i> .
EVENT_DETAILS	VARCHAR	Additional information about the event—for example, how much memory <code>malloc_trim()</code> reclaimed.
DURATION_US	INTEGER	Duration of the event in microseconds (μ s).

Privileges

None

Examples

```
=> SELECT * FROM MEMORY_EVENTS;
-[ RECORD 1 ]-+-----
event_time | 2019-05-02 13:17:20.700892-04
node_name  | v_vmart_node0001
event_type | MALLOC_TRIM
event_reason | memory_trim()
event_details | pre-trim RSS 378822656 post-trim RSS 372129792 benefit 0.0176675
duration_us | 7724
```

MEMORY_USAGE

Records system resource history for memory usage. This is useful for comparing memory that Vertica uses versus memory in use by the entire system.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
START_TIME	TIMESTAMP	Beginning of history interval.
END_TIME	TIMESTAMP	End of history interval.
AVERAGE_MEMORY_USAGE_PERCENT	FLOAT	Records the average memory usage in percent of total memory (0-100) during the history interval.

Privileges

Superuser

MERGEOUT_PROFILES

Returns information about and status of automatic mergeout operations.

This table excludes operations with a `REQUEST_TYPE` of `NO_WORK`. It also excludes the operations of [user-invoked mergeout](#) functions, such as [DO_TM_TASK](#) .

Column Name	Data Type	Description
START_TIME	TIMESTAMP	When the Tuple Mover began processing storage location mergeout requests.
END_TIME	TIMESTAMP	When the mergeout finished.

TRANSACTION_ID	INTEGER	Identifier for the transaction within the session.
NODE_NAME	VARCHAR	Node name for which information is listed.
SCHEMA_NAME	VARCHAR	The schema for which information is listed.
TABLE_NAME	VARCHAR	The table for which information is listed.
PROJECTION_NAME	VARCHAR	The projection for which information is listed.
PROJECTION_OID	INTEGER	Projection's unique catalog identifier.
REQUEST_TYPE	VARCHAR	Identifies the type of operation performed by the tuple mover. Possible values: <ul style="list-style-type: none"> • PURGE • MERGEOUT • DVMERGEOUT
EVENT_TYPE	VARCHAR	Displays the status of the mergeout operation. Possible values: <ul style="list-style-type: none"> • ERROR • RETRY • REQUEST_QUEUED • REQUEST_COMPLETED
THREAD_ID	INTEGER	The ID of the thread that performed the mergeout.
STRATA_NO	INTEGER	The ID of the strata the ROS container belongs to.
PARTITION_KEY	INTEGER	The key of the partition.
CONTAINER_COUNT	INTEGER	The number of ROS containers in the mergeout operation.
TOTAL_SIZE_IN_BYTES	INTEGER	Size in bytes of all ROS containers in the mergeout operation.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

Examples

The following statement returns failed mergeout operations for table public.store_orders.

```
=> SELECT node_name, schema_name, table_name, request_type, event_type FROM mergeout_profiles WHERE event_type='ERROR';
 node_name | schema_name | table_name | request_type | event_type
-----+-----+-----+-----+-----
v_vmart_node0002 | public | store_orders | MERGEOUT | ERROR
v_vmart_node0002 | public | store_orders | MERGEOUT | ERROR
v_vmart_node0001 | public | store_orders | MERGEOUT | ERROR
v_vmart_node0001 | public | store_orders | MERGEOUT | ERROR
v_vmart_node0003 | public | store_orders | MERGEOUT | ERROR
v_vmart_node0003 | public | store_orders | MERGEOUT | ERROR
v_vmart_node0003 | public | store_orders | MERGEOUT | ERROR
v_vmart_node0002 | public | store_orders | MERGEOUT | ERROR
v_vmart_node0001 | public | store_orders | MERGEOUT | ERROR
(9 rows)
```

See also

MODEL_STATUS_HISTORY

Lists the status history of registered machine learning models in the database, including models that have been unregistered or dropped. Only superusers or users to whom superusers have granted sufficient privileges can query the table. Vertica recommends granting access to the [MLSUPERVISOR](#) role.

Column Name	Data Type	Description
REGISTERED_NAME	VARCHAR	Abstract name to which the model, identified by MODEL_ID , was registered at the time of the status change. This REGISTERED_NAME can represent a group of models for a higher-level application, where each model in the group has a unique version number.
REGISTERED_VERSION	INTEGER	Unique version number of the registered model under its specified REGISTERED_NAME .
NEW_STATUS	VARCHAR	New status of the registered model.
OLD_STATUS	VARCHAR	Old status of the registered model.
STATUS_CHANGE_TIME	TIMESTAMPTZ	Time at which the model status was changed.
OPERATOR_ID	INTEGER	Internal ID of the user who performed the status change.
OPERATOR_NAME	VARCHAR	Name of the user who performed the status change.
MODEL_ID	INTEGER	Internal ID of the model for which information is listed.
SCHEMA_NAME	VARCHAR	Name of the schema that contains the model. This value is NULL if the model has been dropped.
MODEL_NAME	VARCHAR	Name of the model. This value is NULL if the model has been dropped. Each existing model can be uniquely identified by either its [schema_name .] model_name or the combination of its REGISTERED_NAME and REGISTERED_VERSION .

Example

If a superuser grants SELECT access of the table to the MLSUPERVISOR role, users with that role can then query the MODEL_STATUS_HISTORY table:

```
-- as superuser
=> GRANT SELECT ON TABLE v_monitor.model_status_history TO MLSUPERVISOR;
WARNING 8555: You are granting privilege on a system table used by superuser only. Revoke the grant if you are unsure
GRANT PRIVILEGE

-- as user with MLSUPERVISOR role
=> SELECT * FROM MODEL_STATUS_HISTORY;
registered_name | registered_version | new_status | old_status | status_change_time | operator_id | operator_name | model_id | schema_name |
model_name

MONITORING_EVENTS

Reports significant events that can affect database performance and functionality if you do not address their root causes.

See [Monitoring events](#) for details.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
EVENT_CODE	INTEGER	Numeric identifier that indicates the type of event. See Event Types in Monitoring events for a list of event type codes.
EVENT_ID	INTEGER	Unique numeric ID that identifies the specific event.
EVENT_SEVERITY	VARCHAR	Severity of the event from highest to lowest. These events are based on standard syslog severity types: 0 – Emergency 1 – Alert 2 – Critical 3 – Error 4 – Warning 5 – Notice 6 – Info 7 – Debug
EVENT_POSTED_TIMESTAMP	TIMESTAMPTZ	When this event was posted.
EVENT_CLEARED_TIMESTAMP	TIMESTAMPTZ	When this event was cleared. Note: You can also query the ACTIVE_EVENTS system table to see events that have not been cleared.
EVENT_EXPIRATION	TIMESTAMPTZ	Time at which this event expires. If the same event is posted again prior to its expiration time, this field gets updated to a new expiration time.
EVENT_CODE_DESCRIPTION	VARCHAR	Brief description of the event and details pertinent to the specific situation.
EVENT_PROBLEM_DESCRIPTION	VARCHAR	Generic description of the event.

Privileges

Superuser

See also

[ACTIVE_EVENTS](#)

NETWORK_INTERFACES

Provides information about network interfaces on all Vertica nodes.

Column Name	Data Type	Description
NODE_ID	INTEGER	Unique identifier for the node that recorded the row.

NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
INTERFACE	VARCHAR	Network interface name.
IP_ADDRESS_FAMILY	VARCHAR	Network address family (either 'ipv4' or 'ipv6').
IP_ADDRESS	VARCHAR	IP address for this interface.
SUBNET	VARCHAR	IP subnet for this interface.
MASK	VARCHAR	IP network mask for this interface.
BROADCAST_ADDRESS	VARCHAR	IP broadcast address for this interface.

Privileges

None

Examples

```
=> \x

NETWORK_USAGE

Provides network bandwidth usage history on the system. This is useful for determining if Vertica is using a large percentage of its available network bandwidth.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
START_TIME	TIMESTAMP	Beginning of history interval.
END_TIME	TIMESTAMP	End of history interval.
TX_KBYTES_PER_SEC	FLOAT	Counter history of outgoing (transmitting) usage in kilobytes per second.
RX_KBYTES_PER_SEC	FLOAT	Counter history of incoming (receiving) usage in kilobytes per second.

Privileges

Superuser

NODE_EVICTIONS

Monitors node evictions on the system.

Column Name	Data Type	Description
EVICTION_TIMESTAMP	TIMESTAMPTZ	Timestamp when the eviction request was made.
NODE_NAME	VARCHAR	The node name logging the information.
EVICTED_NODE_NAME	VARCHAR	The node name of the evicted node.
EVICTED_NODE_ID	INTEGER	The evicted node ID.

NODE_STATE_BEFORE_EVICTION	VARCHAR	The previous node state at the time of eviction.
-----------------------------------	---------	--

NODE_RESOURCES

Provides a snapshot of the node. This is useful for regularly polling the node with automated tools or scripts.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
HOST_NAME	VARCHAR	The hostname associated with a particular node.
NODE_IDENTIFIER	VARCHAR	A unique identifier for the node.
PROCESS_SIZE_BYTES	INTEGER	The total size of the program.
PROCESS_RESIDENT_SET_SIZE_BYTES	INTEGER	The total number of bytes that the process has in memory.
PROCESS_SHARED_MEMORY_SIZE_BYTES	INTEGER	The amount of shared memory used.
PROCESS_TEXT_MEMORY_SIZE_BYTES	INTEGER	The total number of text bytes that the process has in physical memory. This does not include any shared libraries.
PROCESS_DATA_MEMORY_SIZE_BYTES	INTEGER	The amount of physical memory, in bytes, used for performing processes. This does not include the executable code.
PROCESS_LIBRARY_MEMORY_SIZE_BYTES	INTEGER	The total number of library bytes that the process has in physical memory.
PROCESS_DIRTY_MEMORY_SIZE_BYTES	INTEGER	The number of bytes that have been modified since they were last written to disk.
SPREAD_HOST	VARCHAR	The node name of the spread host.
NODE_PORT	VARCHAR	The port used for intra-cluster communication.
DATA_PORT	VARCHAR	The port used by the Vertica client.
DBCLERK	BOOLEAN	Whether this node is the DB clerk. The DB clerk is responsible for coordinating some administrative tasks in the database.

NODE_STATES

Monitors node recovery state-change history on the system. Vertica returns information only on nodes whose state is currently UP. To determine which nodes are not up, query the [NODES](#) table.

Column Name	Data Type	Description
EVENT_TIMESTAMP	TIMESTAMPTZ	Time when Vertica recorded the event.
NODE_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the node.
NODE_NAME	VARCHAR	Name of the node.

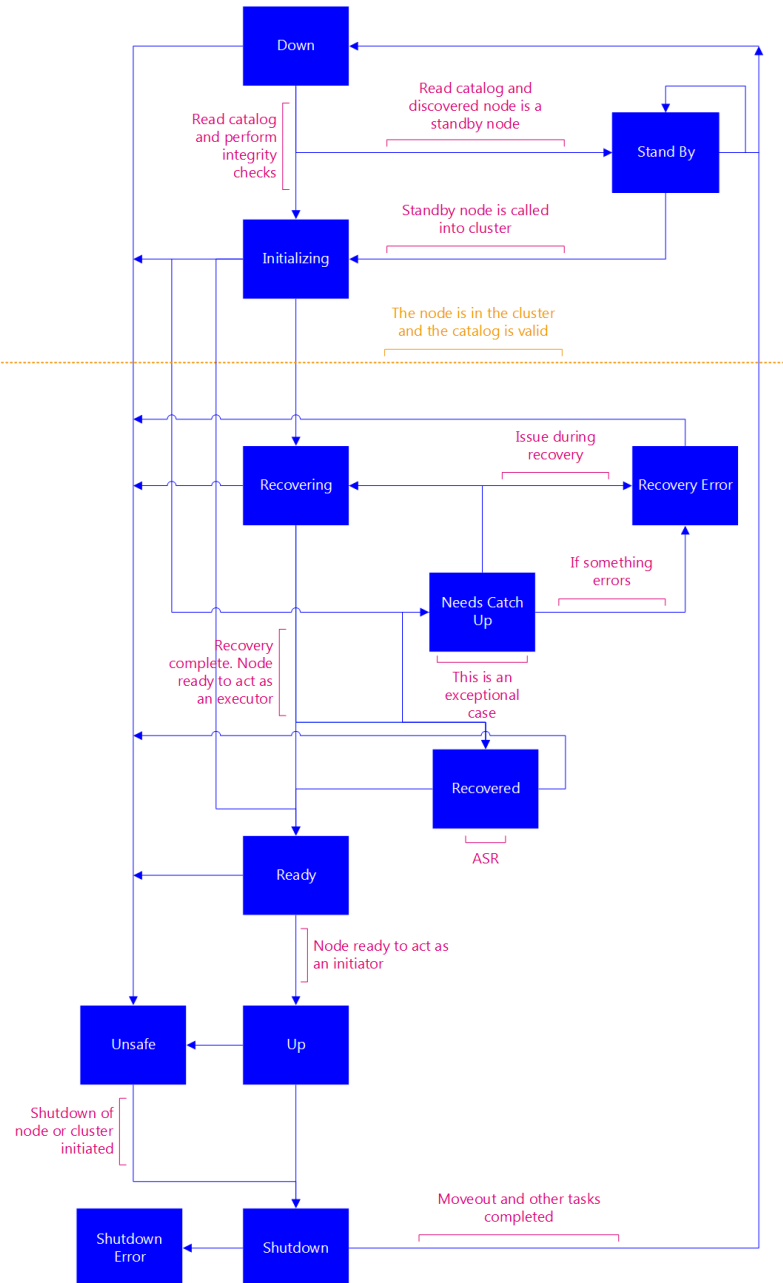

NODE_STATE

VARCHAR

The node's state, one of the following:

- UP
- DOWN
- READY
- UNSAFE
- SHUTDOWN
- SHUTDOWN_ERROR
- RECOVERING
- RECOVER_ERROR
- RECOVERED
- INITIALIZING
- STANDBY
- NEEDS_CATCHUP

The following flow chart details different node states:

Privileges

None

NOTIFIER_ERRORS

Reports errors encountered by [notifiers](#).

Column Name	Data Type	Description
<code>ERROR_TIME</code>	TIMESTAMPTZ	The time that the error occurred.
<code>NODE_NAME</code>	VARCHAR	Name of the node that encountered the error.
<code>NOTIFIER_NAME</code>	VARCHAR	Name of the notifier that triggered the error.
<code>DESCRIPTION</code>	VARCHAR	A description of the error.

Privileges

Superuser

OUTPUT_DEPLOYMENT_STATUS

Contains information about the deployment status of all the projections in your design. Each row contains information about a different projection. Vertica populates this table when you deploy the database design by running the function [DESIGNER_RUN_POPULATE_DESIGN_AND_DEPLOY](#).

Column Name	Column Type	Description
<code>deployment_id</code>	INTEGER	Unique ID that Database Designer assigned to the deployment.
<code>design_name</code>	VARCHAR	Unique name that the user assigned to the design.
<code>deployment_projection_id</code>	INTEGER	Unique ID that Database Designer assigned to the output projection.
<code>deployment_projection_name</code>	VARCHAR	Name that Database Designer assigned to the output projection or the name of the projection to be dropped.
<code>deployment_status</code>	VARCHAR	Status of the deployment: <ul style="list-style-type: none">• <code>pending</code>• <code>complete</code>• <code>needs_refresh</code>• <code>in_progress</code>• <code>error</code>
<code>error_message</code>	VARCHAR	Text of any error that occurred when creating or refreshing the specified projection.

OUTPUT_EVENT_HISTORY

Contains information about each stage that Database Designer performs to design and optimize your database design.

Column Name	Data Type	Description
<code>TIME_STAMP</code>	TIMESTAMP	Date and time of the specified stage.
<code>DESIGN_ID</code>	INTEGER	Unique id that Database Designer assigned to the design.
<code>DESIGN_NAME</code>	VARCHAR	Unique name that the user assigned to the design.

STAGE_TYPE	VARCHAR	Design stage that Database Designer was working on at the time indicated by the TIME_STAMP field. Possible values include: <ul style="list-style-type: none"> • Design in progress • Analyzing data statistics • Optimizing query performance • Optimizing storage footprint • All done • Deployment in progress
ITERATION_NUMBER	INTEGER	Iteration number for the Optimizing query performance stage.
TOTAL_QUERY_COUNT	INTEGER	Total number of design queries in the design.
REMAINING_QUERY_COUNT	INTEGER	Number of design queries remaining for Database Designer to process.
MAX_STEP_NUMBER	INTEGER	Number of steps in the current stage.
CURRENT_STEP_NUMBER	INTEGER	Step in the current stage being processed at the time indicated by the TIME_STAMP field.
CURRENT_STEP_DESCRIPTION	VARCHAR	Name of the step that Database Designer is performing at that time indicated in the TIME_STAMP field. Possible values include: <ul style="list-style-type: none"> • Design with deployment started • Design in progress: Analyze statistics phase • design_table_name • projection_name • Design in progress: Query optimization phase • Extracting interesting columns • Enumerating sort orders • Setting up projection candidates • Assessing projection candidates • Choosing best projections • Calculating estimated benefit of best projections • Complete • Design in progress: Storage optimization phase • Design completed successfully • Setting up deployment metadata • Identifying projections to be dropped • Running deployment • Deployment completed successfully
TABLE_ID	INTEGER	Unique id that Database Designer assigned to the design table.

Examples

The following example shows the steps that Database Designer performs while optimizing the VMart example database:

```
=> SELECT DESIGNER_CREATE_DESIGN('VMART_DESIGN');
=> SELECT DESIGNER_ADD_DESIGN_TABLES('VMART_DESIGN','public.*');
=> SELECT DESIGNER_ADD_DESIGN_QUERIES('VMART_DESIGN','/tmp/examples/vmart_queries.sql',);
...
=> \x
Expanded display is on.
=> SELECT * FROM OUTPUT_EVENT_HISTORY;

PARTITION_COLUMNS

For each projection of a partitioned table, shows the following information:

- Disk space used by each column per node.
- Statistics that were collected on partition columns

Disk usage

The column `DISK_SPACE_BYTES` shows how much disk space the partitioned data uses, including deleted data. So, if you delete rows but do not purge them, the `DELETED_ROW_COUNT` column changes to show the number of deleted rows in each column; however, `DISK_SPACE_BYTES` remains unchanged. After deleted rows are purged, Vertica reclaims the disk space: `DISK_SPACE_BYTES` changes accordingly, and `DELETED_ROW_COUNT` is reset to 0.

For grouped partitions, `PARTITION_COLUMNS` shows the cumulative disk space used for each column per grouped partition. The column `GROUPED_PARTITION_KEY`, if not null, identifies the partition in which a given column is grouped.

Statistics

`STATISTICS_TYPE` always shows the most complete type of statistics that are available on a given column, irrespective of timestamp. For example, if you collect statistics for a table on all levels— [table](#), [partition](#), and [row](#), `STATISTICS_TYPE` is set to `FULL` (table-level), even if partition- and row-level statistics were collected more recently.

Column Name	Data Type	Description
<code>COLUMN_NAME</code>	<code>VARCHAR</code>	Identifies a named column within the partitioned table.
<code>COLUMN_ID</code>	<code>INTEGER</code>	Unique numeric ID assigned by the Vertica, which identifies the column.
<code>TABLE_NAME</code>	<code>VARCHAR</code>	Name of the partitioned table.
<code>PROJECTION_NAME</code>	<code>VARCHAR</code>	Projection name for which information is listed.
<code>PROJECTION_ID</code>	<code>INTEGER</code>	Unique numeric ID assigned by Vertica, which identifies the projection.
<code>NODE_NAME</code>	<code>VARCHAR</code>	Node that hosts partitioned data.
<code>PARTITION_KEY</code>	<code>VARCHAR</code>	Identifies the table partition.
<code>GROUPED_PARTITION_KEY</code>	<code>VARCHAR</code>	Identifies the grouped partition to which a given column belongs.
<code>ROW_COUNT</code>	<code>INTEGER</code>	The total number of partitioned data rows for each column, including deleted rows.
<code>DELETED_ROW_COUNT</code>	<code>INTEGER</code>	Number of deleted partitioned data rows in each column.
<code>DISK_SPACE_BYTES</code>	<code>INTEGER</code>	Amount of space used by partitioned data.
<code>STATISTICS_TYPE</code>	<code>VARCHAR</code>	Specifies what sort of statistics are used for this column, one of the following listed in order of precedence: 1. <code>FULL</code> : Table-level statistics 2. <code>PARTITION</code> : Partition-level statistics 3. <code>ROWCOUNT</code> : Minimal set of statistics and aggregate row counts
<code>STATISTICS_UPDATED_TIMESTAMP</code>	<code>TIMESTAMPTZ</code>	Specifies when statistics of the type specified in <code>STATISTICS_TYPE</code> were collected for this column.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

Examples

Given the following table definition:

```
=> CREATE TABLE messages
(
  time_interval timestamp NOT NULL,
  thread_id varchar(32) NOT NULL,
  unique_id varchar(53) NOT NULL,
  msg_id varchar(65),
  ...
)
PARTITION BY ((messages.time_interval)::date);
```

a query on [partition_columns](#) might return the following (truncated) results:

```
=> SELECT * FROM partition_columns order by table_name, column_name;
column_name | column_id | table_name | projection_name | projection_id | node_name | partition_key | grouped_partition_key | row_count |
deleted_row_count | disk_space_bytes

(11747 rows)
```

Monitors all background partitioning tasks, and if Vertica encounters an error, creates an entry in this table with the appropriate information. Does not log repartitioning tasks that complete successfully.

Column Name	Data Type	Description
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
USER_NAME	VARCHAR	Name of the user who received the error at the time Vertica recorded the session.
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
TABLE_NAME	VARCHAR	Name of the partitioned table.
PROJECTION_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the projection.
PROJECTION_NAME	VARCHAR	Projection name for which information is listed.
MESSAGE	VARCHAR	Textual output of the error message.
HINT	VARCHAR	Actionable hint about the error.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

PARTITION_STATUS

For each projection of each partitioned table, shows the fraction of its data that is actually partitioned according to the current partition expression. When the partitioning of a table is altered, the value in **PARTITION_REORGANIZE_PERCENT** for each of its projections drops to zero and goes back up to 100 when all the data is repartitioned.

Column Name	Data Type	Description
PROJECTION_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the projection.
TABLE_SCHEMA	VARCHAR	Name of the schema that contains the partitioned table.
TABLE_NAME	VARCHAR	Table name that is partitioned.
TABLE_ID	INTEGER	Unique numeric ID assigned by the Vertica, which identifies the table.
PROJECTION_SCHEMA	VARCHAR	Schema containing the projection.
PROJECTION_NAME	VARCHAR	Projection name for which information is listed.
PARTITION_REORGANIZE_PERCENT	INTEGER	For each projection, drops to zero and goes back up to 100 when all the data is repartitioned after the partitioning of a table has been altered. Ideally all rows will show 100 (%).

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

PARTITIONS

Displays partition metadata, one row per partition key, per ROS container.

Column Name	Data Type	Description
<code>PARTITION_KEY</code>	VARCHAR	The partition value(s).
<code>PROJECTION_ID</code>	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the projection.
<code>TABLE_SCHEMA</code>	VARCHAR	The schema name for which information is listed. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <code>n1.s</code> refers to schema <code>s</code> in namespace <code>n1</code> .
<code>PROJECTION_NAME</code>	VARCHAR	The projection name for which information is listed.
<code>ROS_ID</code>	VARCHAR	A unique numeric ID assigned by the Vertica catalog, which identifies the ROS container.
<code>ROS_SIZE_BYTES</code>	INTEGER	The ROS container size in bytes.
<code>ROS_ROW_COUNT</code>	INTEGER	Number of rows in the ROS container.
<code>NODE_NAME</code>	VARCHAR	Node where the ROS container resides.
<code>DELETED_ROW_COUNT</code>	INTEGER	The number of deleted rows in the partition.
<code>LOCATION_LABEL</code>	VARCHAR	The location label of the default storage location.

Notes

- A many-to-many relationship exists between partitions and ROS containers. `PARTITIONS` displays information in a denormalized fashion.
- To find the number of ROS containers having data of a specific partition, aggregate `PARTITIONS` over the `partition_key` column.
- To find the number of partitions stored in a ROS container, aggregate `PARTITIONS` over the `ros_id` column.

Examples

See [Viewing partition storage data](#).

PROCESS_SIGNALS

Returns a history of signals that were received and handled by the Vertica process. For details about signals, see the [Linux documentation](#).

Column Name	Data Type	Description
<code>SIGNAL_TIMESTAMP</code>	TIMESTAMPTZ	Time when Vertica recorded the signal.
<code>NODE_NAME</code>	VARCHAR	Name of the node that is reporting the requested information.
<code>SIGNAL_NUMBER</code>	INTEGER	Signal number, refers to <code>POSIX SIGNAL_NUMBER</code>
<code>SIGNAL_CODE</code>	INTEGER	Signal code.
<code>SIGNAL_PID</code>	INTEGER	Linux process identifier of the signal.
<code>SIGNAL_UID</code>	INTEGER	Process ID of sending process.
<code>SIGNAL_ADDRESS</code>	INTEGER	Address at which fault occurred.

Privileges

Superuser

PROJECTION_RECOVERIES

Retains history about projection recoveries. Because Vertica adds an entry per recovery plan, a projection/node pair might appear multiple times in the output.

Note

You cannot query this or other system tables during cluster recovery; the cluster must be UP to accept connections.

Column Name	Data Type	Description
<code>NODE_NAME</code>	VARCHAR	Name of the node that is recovering or has recovered the corresponding projection.
<code>PROJECTION_ID</code>	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the projection.
<code>PROJECTION_NAME</code>	VARCHAR	Name of the projection that is being or has been recovered on the corresponding node.
<code>TRANSACTION_ID</code>	INTEGER	Identifier for the transaction within the session, if any. <code>TRANSACTION_ID</code> initializes as <code>NO_TRANSACTION</code> with a value of 0. Vertica will ignore the recovery query and keep (0) if there's no action to take (no data in the table, etc). When no recovery transaction starts, <code>ignored</code> value appears in this table's <code>STATUS</code> column.
<code>STATEMENT_ID</code>	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of <code>TRANSACTION_ID</code> , <code>STATEMENT_ID</code> uniquely identifies a statement within a session.
<code>METHOD</code>	VARCHAR	Recovery method that Vertica chooses. Possible values are: <ul style="list-style-type: none"><code>incremental</code><code>incremental-replay-delete</code><code>split</code><code>recovery-by-container</code>
<code>STATUS</code>	VARCHAR	Current projection-recovery status on the corresponding node. <code>STATUS</code> can be "queued," which indicates a brief period between the time the query is prepared and when it runs. Possible values are: <ul style="list-style-type: none"><code>queued</code><code>running</code><code>finished</code><code>ignored</code><code>error-retry</code><code>error-fatal</code>
<code>PROGRESS</code>	INTEGER	An estimate (value in the range [0,100]) of percent complete for the recovery task described by this information. Note: The actual amount of time it takes to complete a recovery task depends on a number of factors, including concurrent workloads and characteristics of the data; therefore, accuracy of this estimate can vary. The <code>PROGRESS</code> column value is <code>NULL</code> after the task completes.

DETAIL	VARCHAR	<p>More detailed information about PROGRESS. The values returned for this column depend on the type of recovery plan:</p> <ul style="list-style-type: none"> • General recovery plans – value displays the estimated progress, as a percent, of the three primary parts of the plan: Scan , Sort, and Write . • Recovery-by-container plans – value begins with CopyStorage: and is followed by the number of bytes copied over the total number of bytes to copy. • Replay delete plans – value begins with Delete: and is followed by the number of deletes replayed over an estimate of the total number of deletes to replay. <p>The DETAIL column value becomes NULL after the recovery plan completes.</p>
START_TIME	TIMESTAMPZ	Time the recovery task described by this information started.
END_TIME	TIMESTAMPZ	Time the recovery task described by this information ended.
RUNTIME_PRIORITY	VARCHAR	<p>Determines the amount of runtime resources (CPU, I/O bandwidth) the Resource Manager should dedicate to running queries in the resource pool. Valid values are:</p> <ul style="list-style-type: none"> • HIGH • MEDIUM • LOW

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

[RECOVERY_STATUS](#)

PROJECTION_REFRESHES

Records information about successful and unsuccessful [refresh operations](#). PROJECTION_REFRESHES retains projection refresh data until one of the following events occurs:

- Another refresh operation starts on a given projection.
- [CLEAR_PROJECTION_REFRESHES](#) is called and clears data on all projections.
- The table's storage quota is exceeded.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node where the refresh was initiated.
PROJECTION_SCHEMA	VARCHAR	Name of the projection schema.
PROJECTION_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the projection.
PROJECTION_NAME	VARCHAR	Name of the refreshed projection.
ANCHOR_TABLE_NAME	VARCHAR	Name of the projection's anchor table.
REFRESH_STATUS	VARCHAR	<p>Status of refresh operations for this projection, one of the following:</p> <ul style="list-style-type: none"> • Queued : Projection is queued for refresh. • Refreshing: Projection refresh is in progress. • Refreshed: Projection refresh is complete. • Failed: Projection refresh failed.
PERCENT_COMPLETE	VARCHAR	Shows the current percentage of completion for the refresh operation. When the refresh is complete, the column is set to NULL.

REFRESH_PHASE	VARCHAR	<p>Indicates how far the refresh has progressed:</p> <ul style="list-style-type: none"> • Historical: Refresh reached the first phase and is refreshing data from historical data. This refresh phase requires the most amount of time. • Current: Refresh reached the final phase and is attempting to refresh data from the current epoch. To complete this phase, refresh must obtain a lock on the table. If the table is locked by another transaction, refresh is blocked until that transaction completes. <p>The LOCKS system table is useful for determining if a refresh is blocked on a table lock. To determine if a refresh has been blocked, locate the term "refresh" in the transaction description. A refresh has been blocked when the scope for the refresh is REQUESTED and other transactions acquired a lock on the table.</p> <p>This field is NULL until the projection starts to refresh and is NULL after the refresh completes.</p>
REFRESH_METHOD	VARCHAR	<p>Method used to refresh the projection:</p> <ul style="list-style-type: none"> • Buddy: Projection refreshed from the contents of a buddy projection. This method maintains historical data, so the projection can be used for historical queries. • Scratch: Projection refreshed without using a buddy projection. This method does not generate historical data, so the projection cannot participate in historical queries on data that precedes the refresh. • Rebalance: If the projection is segmented, it is refreshed from scratch; if unsegmented, it is refreshed from a buddy projection. • Incremental: Projections of a partitioned table were refreshed one partition at a time. For details, see Refreshing projections.
REFRESH_FAILURE_COUNT	INTEGER	<p>Number of times a refresh failed for the projection. REFRESH_FAILURE_COUNT does not indicate whether the projection was eventually refreshed. See REFRESH_STATUS to determine whether the refresh operation is progressing.</p>
SESSION_ID	VARCHAR	<p>Unique numeric ID assigned by the Vertica catalog, which identifies the refresh session.</p>
REFRESH_START	TIMESTAMPTZ	<p>Time the projection refresh started.</p>
REFRESH_DURATION_SEC	INTERVAL SECOND (0)	<p>How many seconds the projection refresh ran.</p>
IS_EXECUTING	BOOLEAN	<p>Differentiates active and completed refresh operations.</p>
RUNTIME_PRIORITY	VARCHAR	<p>Determines how many run-time resources (CPU, I/O bandwidth) the Resource Manager should dedicate to running queries in the resource pool, one of the following:</p> <ul style="list-style-type: none"> • HIGH • MEDIUM • LOW
TRANSACTION_ID	INTEGER	<p>Identifier for the transaction within the session, if any; otherwise NULL.</p> <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px;"> <p>Note</p> <p>The transaction_id is correlated with the execution plan only when refreshing from scratch. When refreshing from a buddy, multiple sub-transactions are created</p> </div>

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

PROJECTION_STORAGE

Monitors the amount of disk storage used by each projection on each node.

Note
Projections that have no data never have full statistics. Querying this system table lets you see if your projection contains data.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
PROJECTION_ID	VARCHAR	Catalog-assigned numeric value that uniquely identifies the projection.
PROJECTION_NAME	VARCHAR	The projection name for which information is listed.
PROJECTION_SCHEMA	VARCHAR	The name of the schema associated with the projection.
PROJECTION_COLUMN_COUNT	INTEGER	The number of columns in the projection.
ROW_COUNT	INTEGER	The number of rows in the table's projections, including any rows marked for deletion.
USED_BYTES	INTEGER	Number of bytes in disk storage used to store the compressed projection data. This value should not be compared to the output of the AUDIT function, which returns the raw data size of database objects.
ROS_COUNT	INTEGER	The number of ROS containers in the projection.
ANCHOR_TABLE_NAME	VARCHAR	The associated table name for which information is listed.
ANCHOR_TABLE_SCHEMA	VARCHAR	The associated table schema for which information is listed.
ANCHOR_TABLE_ID	INTEGER	A unique numeric ID, assigned by the Vertica catalog, which identifies the anchor table.

See also

- [PROJECTIONS](#)
- [ANALYZE_STATISTICS](#)

PROJECTION_USAGE

Records information about projections Vertica used in each processed query.

Column Name	Data Type	Description
QUERY_START_TIMESTAMP	TIMESTAMPTZ	Value of query at beginning of history interval.
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
USER_NAME	VARCHAR	Name of the user at the time Vertica recorded the session.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
REQUEST_ID	INTEGER	Unique identifier of the query request in the user session.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any; otherwise NULL .

STATEMENT_ID	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID, and REQUEST_ID uniquely identifies a statement within a session.
IO_TYPE	VARCHAR	Input/output.
PROJECTION_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the projection.
PROJECTION_NAME	VARCHAR	Projection name for which information is listed.
ANCHOR_TABLE_ID	INTEGER	Unique numeric ID assigned by the Vertica, which identifies the anchor table.
ANCHOR_TABLE_SCHEMA	VARCHAR	Name of the schema that contains the anchor table.
ANCHOR_TABLE_NAME	VARCHAR	Name of the projection's associated anchor table.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

QUERY_CONSUMPTION

Summarizes execution of individual queries. Columns STATEMENT_ID and TRANSACTION_ID combine as unique keys to these queries. One exception applies: a query with multiple plans has as many records.

Column Name	Data Type	Description
START_TIME END_TIME	TIMESTAMP	Demarcate the start and end of query execution, whether successful or not.
SESSION_ID	VARCHAR	Identifies the session where profiling information was captured. This identifier is unique within the cluster at any point in time, but can be reused when the session closes.
USER_ID	INTEGER	Unique numeric user identifier assigned by the Vertica catalog.
USER_NAME	VARCHAR	User name specified by this query profile.
TRANSACTION_ID	INTEGER	Identifies the transaction in which the query ran.
STATEMENT_ID	INTEGER	Numeric identifier of this query, unique within the query transaction.
CPU_CYCLES_US	INTEGER	Sum, in microseconds, of CPU cycles spent by all threads to process this query.
NETWORK_BYTES_SENT NETWORK_BYTES_RECEIVED	INTEGER	Total amount of data sent/received over the network by execution engine operators.
DATA_BYTES_READ DATA_BYTES_WRITTEN	INTEGER	Total amount of data read/written by storage operators from and to disk, includes all locations: local, HDFS, S3.
DATA_BYTES_LOADED	INTEGER	Total amount of data loaded from external sources: COPY, external tables, and data load.
BYTES_SPILLED	INTEGER	Total amount of data spilled to disk—for example, by SortManager, Join, and NetworkSend operators.
INPUT_ROWS	INTEGER	Number of unfiltered input rows from DataSource and Load operators. INPUT_ROWS shows the number of input rows that the query plan worked with, but excludes intermediate processing. For example, INPUT_ROWS excludes how many times SortManager spilled and read the same row.

INPUT_ROWS_PROCESSED	INTEGER	Value of INPUT_ROWS minus what was filtered by applying query predicates (valindex) and SIPs, and rows rejected by COPY.
PEAK_MEMORY_KB	INTEGER	Peak memory reserved by the resource manager for this query.
THREAD_COUNT	INTEGER	Maximum number of threads opened to process this query.
DURATION_MS	INTEGER	Total wall clock time, in milliseconds, spent to process this query.
RESOURCE_POOL	VARCHAR	Name of the resource pool where the query was executed.
OUTPUT_ROWS	INTEGER	Number of rows output to the client.
REQUEST_TYPE	VARCHAR	Type of query—for example, QUERY or DDL.
LABEL	VARCHAR	Label included as a LABEL hint in this query.
IS_RETRY	BOOLEAN	This query was tried earlier.
SUCCESS	BOOLEAN	This query executed successfully.

QUERY_EVENTS

Returns information about query planning, optimization, and execution events.

Column Name	Data Type	Description
EVENT_TIMESTAMP	TIMESTAMPTZ	Time when Vertica recorded the event.
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
USER_ID	INTEGER	Identifier of the user for the query event.
USER_NAME	VARCHAR	Name of the user for which Vertica lists query information at the time it recorded the session.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
REQUEST_ID*	INTEGER	Unique identifier of the query request in the user session.
TRANSACTION_ID*	INTEGER	Identifier for the transaction within the session, if any; otherwise NULL .
STATEMENT_ID*	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed.
EVENT_CATEGORY	VARCHAR	Category of event: OPTIMIZATION or EXECUTION.
EVENT_TYPE	VARCHAR	Type of event. For details on each type, see the following sections: <ul style="list-style-type: none"> • Informational Event Types • Event Types for Corrective Action • Critical Event Types
EVENT_DESCRIPTION	VARCHAR	Generic description of the event.

OPERATOR_NAME	VARCHAR	Name of the Execution Engine component that generated the event, if applicable; for example, NetworkSend. Values from the OPERATOR_NAME and PATH_ID columns let you tie a query event back to a particular operator in the query plan. If the event did not come from a specific operator, the OPERATOR_NAME column is NULL.
PATH_ID	INTEGER	Unique identifier that Vertica assigns to a query operation or path in a query plan, NULL if the event did not come from a specific operator. For more information, see EXECUTION_ENGINE_PROFILES .
OBJECT_ID	INTEGER	Object identifier such as projection or table to which the event refers.
EVENT_DETAILS	VARCHAR	Free-form text describing the specific event.
EVENT_SEVERITY	VARCHAR	Indicates severity of the event with one of the following values: <ul style="list-style-type: none"> • Informational: No action required • Warning: Remedial action recommended as specified in SUGGESTED_ACTION • Critical: Remedial action required, as specified by SUGGESTED_ACTION
SUGGESTED_ACTION	VARCHAR	Specifies remedial action, recommended or required as indicated by EVENT_SEVERITY .

Informational event types

CSE ANALYSIS

The optimizer performed Common subexpressions analysis

CSE ANALYSIS STATS

Time spent on Common subexpressions analysis (msec)

EXPRESSION_EVAL_ERROR

An exception occurred during evaluation of an expression

EXTERNAL_DATA_FILES_PRUNED

Vertica skipped external data files (for example, Iceberg files) that could not satisfy predicates in the query. The event details include the number and paths of pruned files.

EXTERNAL_PREDICATE_PUSHDOWN_NOT_SUPPORTED

Predicate pushdown for older Hive versions may not be supported. For more information, see [Querying external tables](#).

FLATTENED SUBQUERIES

Subqueries flattened in FROM clause

GROUP_BY_PREPASS_FALLBACK

Vertica could not run an optimization. In-memory prepass is disabled. The projection may not be optimal.

GROUPBY PUSHDOWN

Internal to Vertica

LibHDFS++ FAILOVER RETRY

Vertica attempted to contact a NameNode on an HDFS cluster that uses High Availability NameNode and did not receive a response. Vertica retried with a different NameNode.

LibHDFS++ MANUAL FALLBACK

Vertica accessed HDFS using the hdfs URL scheme but HDFSUseWebHDFS is set. Vertica fell back to WebHDFS.

LibHDFS++ UNSUPPORTED OPERATION

Vertica accessed HDFS using the hdfs URL scheme, but the HDFS cluster uses an unsupported feature such as wire encryption or HTTPS_ONLY or the Vertica session uses delegation tokens. Vertica fell back to WebHDFS.

MERGE_CONVERTED_TO_UNION

Vertica has converted a merge operator to a union operator due to the sort order of the multi-threaded storage access stream.

NO GROUPBY PUSHDOWN

Internal to Vertica

NODE PRUNING

Vertica performed node pruning, which is similar to partition pruning, but at the node level.

ORC_FILE_INFO

A query of ORC files encountered missing information (such as time zone) or an unrecognized ORC version. For missing information, Vertica uses a default value (such as the local time zone).

ORC_SOURCE_PRUNED

An entire ORC file was pruned during predicate pushdown.

ORC_STRIPES_PRUNED

The identified stripes were pruned during predicate pushdown. If an entire ORC file was pruned, it is instead recorded with an ORC_SOURCE_PRUNED event.

OUTER_OVERRIDE_NOT_USED

Vertica found swapping inner/outer tables in a join unnecessary because the inner/outer tables were in good order. (For example, a smaller table was used in an inner join.)

OUTER_OVERRIDE_USED

For efficiency and optimization, Vertica has swapped the inner/outer tables in a join. Vertica used the smaller table as the inner table.

PARQUET_ROWGROUPS_PRUNED

The identified row groups were pruned during predicate pushdown.

PARTITION_PATH_PRUNED

A path (reported in event details) was pruned.

PARTITION_PATH_REJECTED

Could not evaluate partition column predicate on a path from source list. Path will be rejected.

PARTITION_PRUNING

COPY pruned partitions. The event reports how many paths were pruned, and PARTITION_PATH_PRUNED events record more details.

PREDICATES_DISCARDED_FROM_SCAN

Some predicates have been discarded from this scan because expression analysis shows they are not needed.

REJECT_ROWNUMS_HIT_BUFFER_LIMIT

Buffering row numbers during rejection hit buffer limit

SEQUENCE_CACHE_REFILLED

Vertica has refilled sequence cache.

SIP_FALLBACK

This optimization did not apply to this query type.

SMALL_MERGE_REPLACED

Vertica has chosen a more efficient way to access the data by replacing a merge.

STORAGE_CONTAINERS_ELIMINATED

Vertica has performed partition pruning for the purpose of optimization.

TRANSITIVE_PREDICATE

Vertica has optimized by adding predicates to joins where it makes logical sense to do so.

For example, for the statement, `SELECT * FROM A, B WHERE A.a = B.a AND A.a = 1`; Vertica may add a predicate `B a = 1` as a filter for better storage access of table `B`.

TYPE_MISMATCH_COLUMNS_PARQUETPARSER

The Parquet parser used loose schema matching to load data, and could not coerce values in the Parquet data to the types defined for the table. By default the parser rejects the row. For more information, see [PARQUET](#).

UNMATCHED_TABLE_COLUMNS_PARQUETPARSER

The Parquet parser used loose schema matching to load data, and columns in the table had no corresponding columns in the data. The columns were given values of NULL.

VALUE_TRUNCATED

A character value is too long.

WEBHDFS_FAILOVER_RETRY

Vertica attempted to contact a NameNode on an HDFS cluster that uses High Availability NameNode and did not receive a response. Vertica retried with a different NameNode.

Warning event types

AUTO_PROJECTION_USED

The optimizer used an [auto-projection](#) to process this query.

Recommendation: Create a projection that is appropriate for this query and others like it; consider using Database Designer to generate query-specific projections.

GROUP_BY_SPILLED

This event type is typically related to a specific type of query, which you might need to adjust.

Recommendation: Identify the type of query and make adjustments accordingly. You might need to adjust resource pools, projections, or the amount of RAM available. Try running the query on a cluster with no additional workload.

INVALID COST

When creating a query plan, the optimizer calculated an invalid cost for a path: not-a-number (NaN) value, infinity value, or negative value. The path cost was set to its default value.

No action available to users.

PATTERN_MATCH_NMEE

More than one pattern event is true for a single row

Recommendation: Modify event expressions to ensure that only one event can be true for any row. Alternatively, modify the query using a [MATCH clause](#) with **ROWS MATCH FIRST EVENT**.

PREDICATE OUTSIDE HISTOGRAM

A predicate value you are trying to match does not exist in a set of possible values for a specific column. For example, you try to match a VARCHAR value WHERE mystring = "ABC<newline>". In this case, the newline character throws off the predicate matching optimizations.

Recommendation: Run [ANALYZE_STATISTICS](#) on the column.

RESEGMENTED_MANY_ROWS

This event type is typically related to a specific type of query, which you might need to adjust.

Recommendation: Do projections need to be segmented in a different way to allow for join locality? Can you rewrite the query to filter out more rows at storage access time? (Typically, Vertica does so automatically through predicate pushdown.) Review your explain plan.

RLE_OVERRIDDEN

The average run counts are not large enough for Run Length Encoding (RLE). This event occurs with queries where the filtered results for certain columns do not work with RLE because cardinality is less than 10.

Recommendation: Review and rewrite your query, if necessary.

Critical event types

DELETE WITH NON OPTIMIZED PROJECTION

One or more projections do not have your delete filter column in their sort order, causing Vertica difficulty identifying rows to mark as deleted.

To resolve: Add the delete filter column to the end of every projection sort order for your target delete table.

JOIN_SPILLED

Vertica has spilled a join to disk. A join spill event slows down the subject query and all other queries as it consumes resources while using disk as virtual memory.

To resolve: Try the following:

1. Review the explain plan. The query might be too ambitious, for example, cross joining two large tables.
2. Consider adding the query to a lower priority pool to reduce impact on other queries.
3. Create projections that allow for a merge join instead of a hash join.
4. Adjust the PLANNEDCONCURRENCY resource pool so that queries have more memory to execute.

MEMORY LIMIT HIT

Indicates query complexity or, possibly, lack of available system memory.

To resolve: Consider adjusting the MAXMEMORYSIZE and PLANNEDCONCURRENCY resource pools so that the optimizer has sufficient memory. On a heavily used system, this event may occur more frequently.

NO HISTOGRAM

Indicates a table does not have an updated column histogram.

To resolve: Running the function ANALYZE_STATISTICS most often corrects this issue.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

- [QUERY_PLAN_PROFILES](#)

QUERY_METRICS

Monitors the sessions and queries running on each node.

Note

Totals in this table are reset each time the database restarts.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
ACTIVE_USER_SESSION_COUNT	INTEGER	The number of active user sessions (connections).
ACTIVE_SYSTEM_SESSION_COUNT	INTEGER	The number of active system sessions.
TOTAL_USER_SESSION_COUNT	INTEGER	The total number of user sessions.
TOTAL_SYSTEM_SESSION_COUNT	INTEGER	The total number of system sessions.
TOTAL_ACTIVE_SESSION_COUNT	INTEGER	The total number of active user and system sessions.
TOTAL_SESSION_COUNT	INTEGER	The total number of user and system sessions.
RUNNING_QUERY_COUNT	INTEGER	The number of queries currently running.
EXECUTED_QUERY_COUNT	INTEGER	The total number of queries that ran.

QUERY_PLAN_PROFILES

Provides detailed execution status for queries that are currently running in the system. Output from the table shows the real-time flow of data and the time and resources consumed for each path in each query plan.

Column Name	Data Type	Description
TRANSACTION_ID	INTEGER	An identifier for the transaction within the session if any; otherwise NULL .
STATEMENT_ID	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID and STATEMENT_ID uniquely identifies a statement within a session; these columns are useful for creating joins with other system tables.
PATH_ID	INTEGER	Unique identifier that Vertica assigns to a query operation or path in a query plan. Textual representation for this path is output in the PATH_LINE column.
PATH_LINE_INDEX	INTEGER	Each plan path in QUERY_PLAN_PROFILES could be represented with multiple rows. PATH_LINE_INDEX returns the relative line order. You should include the PATH_LINE_INDEX column in the QUERY_PLAN_PROFILES ... ORDER BY clause so rows in the result set appear as they do in EXPLAIN-generated query plans.
PATH_IS_EXECUTING	BOOLEAN	Status of a path in the query plan. True (<i>t</i>) if the path has started running, otherwise false.
PATH_IS_COMPLETE	BOOLEAN	Status of a path in the query plan. True (<i>t</i>) if the path has finished running, otherwise false.

IS_EXECUTING	BOOLEAN	Status of a running query. True if the query is currently active (<i>t</i>), otherwise false (<i>f</i>).
RUNNING_TIME	INTERVAL	The amount of elapsed time the query path took to execute.
MEMORY_ALLOCATED_BYTES	INTEGER	The amount of memory the path used, in bytes.
READ_FROM_DISK_BYTES	INTEGER	The number of bytes the path read from disk (or the disk cache).
RECEIVED_BYTES	INTEGER	The number of bytes received over the network.
SENT_BYTES	INTEGER	Size of data sent over the network by the path.
PATH_LINE	VARCHAR	The query plan text string for the path, associated with the PATH ID and PATH_LINE_INDEX columns.

Privileges

Non-superusers see only the records of tables they have permissions to view.

Best practices

Table results can be very wide. For best results when you query **QUERY_PLAN_PROFILES**, sort on these columns:

- **TRANSACTION_ID**
- **STATEMENT_ID**
- **PATH_ID**
- **PATH_LINE_INDEX**

For example:

```
=> SELECT ... FROM query_plan_profiles
WHERE ...
ORDER BY transaction_id, statement_id, path_id, path_line_index;
```

Examples

See [Profiling query plans](#)

See also

- [EXECUTION_ENGINE_PROFILES](#)
- [EXPLAIN](#)
- [PROFILE](#)
- [QUERY_CONSUMPTION](#)
- [QUERY_EVENTS](#)

QUERY_PROFILES

Provides information about executed queries.

Column Name	Data Type	Description
SESSION_ID	VARCHAR	The identification of the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
TRANSACTION_ID	INTEGER	An identifier for the transaction within the session if any; otherwise NULL .
STATEMENT_ID	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID , STATEMENT_ID uniquely identifies a statement within a session.

IDENTIFIER	VARCHAR	A string to identify the query in system tables. Note: You can query the IDENTIFIER column to quickly identify queries you have labeled for profiling and debugging. See Labeling statements for details.
NODE_NAME	VARCHAR	The node name for which information is listed.
QUERY	VARCHAR	The query string used for the query.
QUERY_SEARCH_PATH	VARCHAR	A list of schemas in which to look for tables.
SCHEMA_NAME	VARCHAR	The schema name in which the query is being profiled, set only for load operations.
TABLE_NAME	VARCHAR	The table name in the query being profiled, set only for load operations.
QUERY_DURATION_US	NUMERIC(18,0)	The duration of the query in microseconds.
QUERY_START_EPOCH	INTEGER	The epoch number at the start of the given query.
QUERY_START	VARCHAR	The Linux system time of query execution in a format that can be used as a DATE/TIME expression.
QUERY_TYPE	VARCHAR	Is one of INSERT , SELECT , UPDATE , DELETE , UTILITY , or UNKNOWN .
ERROR_CODE	INTEGER	The return error code for the query.
USER_NAME	VARCHAR	The name of the user who ran the query.
PROCESSED_ROW_COUNT	INTEGER	The number of rows returned by the query.
RESERVED_EXTRA_MEMORY_B	INTEGER	Shows how much unused memory (in bytes) remains that is reserved for a given query but is unassigned to a specific operator. This is the memory from which unbounded operators pull first. The MEMORY_INUSE_KB column in system table RESOURCE_ACQUISITIONS shows how much total memory was acquired for each query. If operators acquire all memory acquired for the query, the plan must request more memory from the Vertica resource manager .
IS_EXECUTING	BOOLEAN	Displays information about actively running queries, regardless of whether profiling is enabled.

QUERY_REQUESTS

Returns information about user-issued query requests. A statement can include more than one query request; for example, adding data to a table could include a constraint check in addition to a load or insert request.

For a consolidated view with one row per statement, see [STATEMENT_OUTCOMES](#) .

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that reported the requested information.
USER_NAME	VARCHAR	Name of the user who issued the query at the time Vertica recorded the session.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused after the session ends.

REQUEST_ID	INTEGER	Unique identifier of the query request in the user session.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any, otherwise NULL.
STATEMENT_ID	INTEGER	Unique identifier for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID, and REQUEST_ID uniquely identifies a statement within a session.
REQUEST_TYPE	VARCHAR	Type of the query request. Examples include, but are not limited to: <ul style="list-style-type: none"> • QUERY • DDL • LOAD • UTILITY • TRANSACTION • PREPARE • EXECUTE • SET • SHOW
REQUEST	VARCHAR	Query statement.
REQUEST_LABEL	VARCHAR	Label of the query, if any.
SEARCH_PATH	VARCHAR	Contents of the search path.
MEMORY_ACQUIRED_MB	FLOAT	Memory acquired by this query request in megabytes.
SUCCESS	BOOLEAN	Whether the query request succeeded.
ERROR_COUNT	INTEGER	Number of errors encountered in this query request (logged in ERROR_MESSAGES).
START_TIMESTAMP	TIMESTAMPTZ	Beginning of history interval.
END_TIMESTAMP	TIMESTAMPTZ	End of history interval.
REQUEST_DURATION	TIMESTAMPTZ	Query request execution time in days, hours, minutes, seconds, and milliseconds.
REQUEST_DURATION_MS	INTEGER	Query request execution time in milliseconds.
IS_EXECUTING	BOOLEAN	Whether the query request is currently running.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

[QUERY_PROFILES](#)

REBALANCE_OPERATIONS

Contains information on historic and ongoing rebalance operations.

Column Name	Data Type	Description
OBJECT_TYPE	VARCHAR	The type of the rebalanced object: <ul style="list-style-type: none"> • Projection • DFSfile
OBJECT_ID	INTEGER	The ID of the rebalanced object.

OBJECT_NAME	VARCHAR	The name of the rebalanced object. Objects can be tables, projections, or other Vertica objects.
PATH_NAME	VARCHAR	The DFS path for unstructured data being rebalanced.
TABLE_NAME	VARCHAR	The name of the rebalanced table. This value is NULL for DFS files.
TABLE_SCHEMA	VARCHAR	The schema of the rebalanced table. This value is NULL for DFS files. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <i>n1.s</i> refers to schema <i>s</i> in namespace <i>n1</i> .
TRANSACTION_ID	INTEGER	The identifier for the transaction within the session.
STATEMENT_ID	INTEGER	The unique numeric ID for the currently-running statement.
NODE_NAME	VARCHAR	Name of the rebalancing node.
OPERATION_NAME	VARCHAR	Identifies the specific rebalance operation being performed, one of: <ul style="list-style-type: none"> • Refresh projection, update <i>temporary projection name</i> and ID to <i>master projection name</i> • Drop unsegmented replicas • Replicate DFS File • Refresh projection • Drop replaced or replacement projection, rename <i>temporary projection name</i> to <i>original projection name</i> • Update temp table segments • Prepare : separate • Move storage containers
OPERATION_STATUS	VARCHAR	Specifies status of the rebalance operation, one of the followin: <ul style="list-style-type: none"> • START • COMPLETE • ABORT
IS_EXECUTING	BOOLEAN	TRUE: the operation is currently running.
REBALANCE_METHOD	VARCHAR	The method that Vertica is using to perform the rebalance, one of the following: <ul style="list-style-type: none"> • REFRESH: New projections are created according to the new segmentation definition. Data is copied via a refresh plan from projections with the previous segmentation to the new segments. This method is used only if START_REFRESH is called, a configuration parameter is set, or K-safety changes. • REPLICATE: Unsegmented projection data is copied to new nodes and removed from ephemeral nodes. • ELASTIC_CLUSTER: The segmentation of existing segmented projections is altered to adjust to a new cluster topology and data is redistributed accordingly.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
OPERATION_START_TIMESTAMP	TIMESTAMPTZ	The time that the rebalance began.
OPERATION_END_TIMESTAMP	TIMESTAMPTZ	The time that the rebalance ended. If the rebalance is ongoing, this value is NULL.

ELASTIC_CLUSTER_VERSION	INTEGER	The Elastic Cluster has a version. Each time the cluster topology changes, this version increments.
IS_LATEST	BOOLEAN	True if this row pertains to the most recent rebalance activity.

Privileges

Superuser

REBALANCE_PROJECTION_STATUS

Maintain history on rebalance progress for relevant projections.

Column Name	Data Type	Description
PROJECTION_ID	INTEGER	Identifier of the projection to rebalance.
PROJECTION_SCHEMA	VARCHAR	Schema of the projection to rebalance. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <code>n1.s</code> refers to schema <code>s</code> in namespace <code>n1</code> .
PROJECTION_NAME	VARCHAR	Name of the projection to rebalance.
ANCHOR_TABLE_ID	INTEGER	Anchor table identifier of the projection to rebalance.
ANCHOR_TABLE_NAME	VARCHAR	Anchor table name of the projection to rebalance.
REBALANCE_METHOD	VARCHAR	Method used to rebalance the projection, one of the following: <ul style="list-style-type: none"> REFRESH: New projections are created according to the new segmentation definition. Data is copied via a refresh plan from projections with the previous segmentation to the new segments. This method is used only if START_REFRESH is called, a configuration parameter is set, or K-safety changes. REPLICATE: Unsegmented projection data is copied to new nodes and removed from ephemeral nodes. ELASTIC_CLUSTER: The segmentation of existing segmented projections is altered to adjust to a new cluster topology and data is redistributed accordingly.
DURATION_SEC	INTERVAL SEC	Deprecated, set to NULL.
SEPARATED_PERCENT	NUMERIC(5,2)	Percent of storage that has been separated for this projection.
TRANSFERRED_PERCENT	NUMERIC(5,2)	Percent of storage that has been transferred, for this projection.
SEPARATED_BYTES	INTEGER	Number of bytes, separated by the corresponding rebalance operation, for this projection.
TO_SEPARATE_BYTES	INTEGER	Number of bytes that remain to be separated by the corresponding rebalance operation for this projection.
TRANSFERRED_BYTES	INTEGER	Number of bytes transferred by the corresponding rebalance operation for this projection.
TO_TRANSFER_BYTES	INTEGER	Number of bytes that remain to be transferred by the corresponding rebalance operation for this projection.

IS_LATEST	BOOLEAN	True if this row pertains to the most recent rebalance activity, where <code>elastic_cluster_version = (SELECT version FROM v_catalog.elastic_cluster);</code>
ELASTIC_CLUSTER_VERSION	INTEGER	The elastic cluster has a version, and each time the cluster topology changes, this version is incremented. This column reflects the version to which this row of information pertains. The <code>TO_*</code> fields (<code>TO_SEPARATE_*</code> and <code>TO_TRANSFER_*</code>) are only valid for the current version. To view only rows from the current, latest or upcoming rebalance operation, use: <code>WHERE elastic_cluster_version = (SELECT version FROM v_catalog.elastic_cluster);</code>

REBALANCE_TABLE_STATUS

Maintain history on rebalance progress for relevant tables.

Column Name	Data Type	Description
TABLE_ID	INTEGER	Identifier of the table that will be, was, or is being rebalanced.
TABLE_SCHEMA	VARCHAR	Schema of the table that will be, was, or is being rebalanced.
TABLE_NAME	VARCHAR	Name of the table that will be, was, or is being rebalanced.
REBALANCE_METHOD	VARCHAR	Method that will be, is, or was used to rebalance the projections of this table. Possible values are: <ul style="list-style-type: none"> • REFRESH • REPLICATE • ELASTIC_CLUSTER
DURATION_SEC	INTERVAL SEC	Deprecated - populated by NULL. Aggregate, by <code>table_id</code> , <code>rebalance_method</code> , and <code>elastic_cluster_version</code> , of the same in REBALANCE_PROJECTION_STATUS .
SEPARATED_PERCENT	NUMERIC(5,2)	Aggregate, by <code>table_id</code> , <code>rebalance_method</code> , and <code>elastic_cluster_version</code> , of the same in <code>REBALANCE_PROJECTION_STATUS</code> .
TRANSFERRED_PERCENT	NUMERIC(5,2)	Aggregate, by <code>table_id</code> , <code>rebalance_method</code> , and <code>elastic_cluster_version</code> , of the same in <code>REBALANCE_PROJECTION_STATUS</code> .
SEPARATED_BYTES	INTEGER	Aggregate, by <code>table_id</code> , <code>rebalance_method</code> , and <code>elastic_cluster_version</code> , of the same in <code>REBALANCE_PROJECTION_STATUS</code> .
TO_SEPARATE_BYTES	INTEGER	Aggregate, by <code>table_id</code> , <code>rebalance_method</code> , and <code>elastic_cluster_version</code> , of the same in <code>REBALANCE_PROJECTION_STATUS</code> .
TRANSFERRED_BYTES	INTEGER	Aggregate, by <code>table_id</code> , <code>rebalance_method</code> , and <code>elastic_cluster_version</code> , of the same in <code>REBALANCE_PROJECTION_STATUS</code> .

<code>TO_TRANSFER_BYTES</code>	INTEGER	Aggregate, by <code>table_id</code> , <code>rebalance_method</code> , and <code>elastic_cluster_version</code> , of the same in <code>REBALANCE_PROJECTION_STATUS</code> .
<code>IS_LATEST</code>	BOOLEAN	True if this row pertains to the most recent rebalance activity, where <code>elastic_cluster_version = (SELECT version FROM v_catalog.elastic_cluster;)</code>
<code>ELASTIC_CLUSTER_VERSION</code>	INTEGER	The Elastic Cluster has a version, and each time the cluster topology changes, this version is incremented. This column reflects the version to which this row of information pertains. The <code>TO_*</code> fields (<code>TO_SEPARATE_*</code> and <code>TO_TRANSFER_*</code>) are only valid for the current version. To view only rows from the current, latest or upcoming rebalance operation, use: <code>WHERE elastic_cluster_version = (SELECT version FROM v_catalog.elastic_cluster;)</code>
<code>start_timestamp</code>	TIMESTAMPTZ	The time that the rebalance began.
<code>end_timestamp</code>	TIMESTAMPTZ	The time that the rebalance ended.

Privileges

Superuser

- [REBALANCE_PROJECTION_STATUS](#)

RECOVERY_STATUS

Provides the status of recovery operations, returning one row for each node.

Note

You cannot query this or other system tables table during cluster recovery; the cluster must be UP to accept connections.

Column Name	Data Type	Description
<code>NODE_NAME</code>	VARCHAR	Name of the node that is reporting the requested information.
<code>RECOVER_EPOCH</code>	INTEGER	Epoch the recovery operation is trying to catch up to.
<code>RECOVERY_PHASE</code>	VARCHAR	Current stage in the recovery process. Can be one of the following: <ul style="list-style-type: none"> • <code>NULL</code> • <code>current</code> • <code>historical pass X</code>, where <code>X</code> is the iteration count
<code>SPLITS_COMPLETED</code>	INTEGER	Number of independent recovery SPLITS queries that have run and need to run.
<code>SPLITS_TOTAL</code>	INTEGER	Total number of SPLITS queries that ran. Each query corresponds to one row in the PROJECTION_RECOVERIES table. If <code>SPLITS_TOTAL = 2</code> , then there should be 2 rows added to <code>PROJECTION_RECOVERIES</code> , showing query details.
<code>HISTORICAL_COMPLETED</code>	INTEGER	Number of independent recovery HISTORICAL queries that have run and need to run.
<code>HISTORICAL_TOTAL</code>	INTEGER	Total number of HISTORICAL queries that ran. Each query corresponds to one row in the <code>PROJECTION_RECOVERIES</code> table. If <code>HISTORICAL_TOTAL = 2</code> , then there should be 2 rows added to <code>PROJECTION_RECOVERIES</code> , showing query details.

CURRENT_COMPLETED	INTEGER	Number of independent recovery CURRENT queries that have run and need to run.
CURRENT_TOTAL	INTEGER	Total number of CURRENT queries that ran. Each query corresponds to one row in the PROJECTION_RECOVERIES table. If CURRENT_TOTAL = 2, then there should be 2 rows added to PROJECTION_RECOVERIES, showing query details.
IS_RUNNING	BOOLEAN	True (<i>t</i>) if the node is still running recovery; otherwise false (<i>f</i>).

Privileges

None

[PROJECTION_RECOVERIES](#)

REMOTE_REPLICATION_STATUS

Provides the status of replication tasks to alternate clusters.

Column Name	Data Type	Description
CURRENT_EPOCH	INTEGER	
EPOCH	INTEGER	
LAST_REPLICATED_TIME	TIMESTAMPTZ	
OBJECTS	VARCHAR	
REPLICATED_EPOCH	INTEGER	
REPLICATION_POINT	VARCHAR	
SNAPSHOT_NAME	VARCHAR	

Privileges

None

REPARENTED_ON_DROP

Lists re-parenting events of objects that were dropped from their original owner but still remain in Vertica. For example, a user may leave the organization and need to be removed from the database. When the database administrator drops the user from the database, that user's objects are re-parented to another user.

In some cases, a Vertica user's objects are reassigned based on the GlobalHeirUsername parameter. In this case, a user's objects are re-parented to the user indicated by this parameter.

Column Name	Data Type	Description
REPARENT_TIMESTAMP	TIMESTAMP	The time the re-parenting event occurred.
NODE_NAME	VARCHAR	The name of the node or nodes on which the re-parenting occurred.
SESSION_ID	VARCHAR	The identification number of the re-parenting event.
USER_ID	INTEGER	The unique, system-generated user identification number.
USER_NAME	VARCHAR	The name of the user that caused the re-parenting event. For example, a dbadmin user may have dropped a user thus re-parenting that user's objects.
TRANSACTION_ID	INTEGER	The system-generated transaction identification number. Is NULL if a transaction id does not exist.

OLD_OWNER_NAME	VARCHAR	The the name of the dropped user who used to own the re-parented object.
OLD_OWNER_OID	INTEGER	The unique identification number of the user who used to own the re-parented object.
NEW_OWNER_NAME	VARCHAR	The name of the user who now owns the re-parented objects.
NEW_OWNER_OID	INTEGER	The unique identification number of the user who now owns the re-parented objects.
OBJ_NAME	VARCHAR	The name of the object being re-parented.
OBJ_OID	INTEGER	The unique identification number of the object being re-parented.
SCHEMA_NAME	VARCHAR	The name of the schema in which the object resides.
SCHEMA_OID	INTEGER	The unique identification number of the schema in which the re-parented object resides.

REPLICATION_STATUS

Shows the status of current and past server-based replication of data from another Eon Mode database to this database. Each row records node-specific information about a given replication. For more information about server-based replication, see [Server-based replication](#).

Note

If you replicate data between the main cluster and a [sandboxed cluster](#), the **SENT_BYTES** and **TOTAL_BYTES_TO_SEND** columns will both have a value of zero. Because the clusters use the same communal storage location, no data is actually copied between the two clusters.

Column name	Data type	Description
NODE_NAME	VARCHAR(128)	The name of the node participating in the replication.
TRANSACTION_ID	INT	The transaction in which the replication took place.
STATUS	VARCHAR(8192)	The state of the replication. Values include: <ul style="list-style-type: none"> abort : The replication did not complete successfully. completed : The replication has completed. data transferring : the node is actively copying shards from the source database's communal storage.
SENT_BYTES	INT	The number of bytes that the node has retrieved from the source database's communal storage.
TOTAL_BYTES_TO_SEND	INT	The total number of bytes the node has to retrieve from the source database's communal storage for this replication.
START_TIME	TIMESTAMPTZ	The start time of the replication.
END_TIME	TIMESTAMPTZ	The time at which the node finished transferring data for the replication.

Example

```

-> SELECT node_name, status, transaction_id FROM REPLICATION_STATUS
ORDER BY start_time ASC;
node_name | status | transaction_id
-----
v_target_db_node0001 | completed | 45035996273706044
v_target_db_node0002 | completed | 45035996273706044
v_target_db_node0003 | completed | 45035996273706044
v_target_db_node0001 | completed | 45035996273706070
v_target_db_node0002 | completed | 45035996273706070
v_target_db_node0003 | completed | 45035996273706070
v_target_db_node0002 | data transferring | 45035996273706136
v_target_db_node0003 | data transferring | 45035996273706136
v_target_db_node0001 | data transferring | 45035996273706136
(9 rows)

```

RESHARDING_EVENTS

Monitors historic and ongoing resharding operations.

Column Name	Data Type	Description
EVENT_TIME_STAMP	TIMESTAMP	Date and time of the resharding event.
NODE_NAME	VARCHAR	Node name for which resharding information is listed.
SESSION_ID	VARCHAR	Unique numeric ID assigned by the Vertica catalog that identifies the session for which resharding information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
USER_ID	INTEGER	Numeric ID of the user who ran the resharding operation.
USER_NAME	VARCHAR	Name of the user who ran the resharding operation.
TRANSACTION_ID	INTEGER	Numeric ID of the specified resharding transaction within the session.
RUNNING_STATUS	VARCHAR	<p>Current status of the resharding operation, one of the following strings:</p> <ul style="list-style-type: none"> • START: The resharding operation has begun on all nodes. • RUNNING: The shard named OLD_SHARD_NAME is currently being resharded on the node. • RESHARDED: The resharding operation on the node is complete for the shard named OLD_SHARD_NAME. • ABORT: The resharding operation was aborted on all nodes. • COMPLETE: The resharding operation has completed for all nodes in the database. <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px;"> <p>Note Only the RESHARDED and RUNNING statuses are logged for each node. All other statuses are logged only on the initiator node.</p> </div>
OLD_SHARD_NAME	VARCHAR	Name of the shard to which the node was subscribed previous to the resharding operation. You can query the SHARDS system table for information about the new shard configuration.
OLD_SHARD_OID	INTEGER	Numeric ID of the shard to which the node was subscribed previous to the resharding operation.
OLD_SHARD_LOWER_BOUND	INTEGER	Lower bound of the shard to which the node was subscribed prior to the resharding operation. This value is set only if the resharding operation is complete for the shard specified by OLD_SHARD_OID.

OLD_SHARD_UPPER_BOUND	INTEGER	Upper bound of the shard to which the node was subscribed prior to the resharding operation. This value is set only if the resharding operation is complete for the shard specified by OLD_SHARD_OID.
CATALOG_SIZE	INTEGER	Catalog size (in bytes) on the node for the shard specified by OLD_SHARD_NAME. This value is provided only when the RUNNING_STATUS of the node is RUNNING or RESHARDED.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

See also

- [Reshard the default namespace](#)
- [RESHARD_DATABASE](#)
- [SHARDS](#)

RESOURCE_ACQUISITIONS

Retains information about resources (memory, open file handles, threads) acquired by each running request. Each request is uniquely identified by its transaction and statement IDs within a given session.

Important

If a request cascades to one or more resource pools beyond the original pool, this table contains multiple records for the same request—one record for each resource pool. The following values are specific to each resource pool:

- Timestamp values: [QUEUE_ENTRY_TIMESTAMP](#) , [ACQUISITION_TIMESTAMP](#) , and [RELEASE_TIMESTAMP](#)
- [DURATION_MS](#)
- [IS_EXECUTING](#)

You can trace the history of cascade events by querying system table [RESOURCE_POOL_MOVE](#).

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node name for which information is listed.
TRANSACTION_ID	INTEGER	Transaction identifier for this request.
STATEMENT_ID	INTEGER	Unique numeric ID for each statement within a transaction. NULL indicates that no statement is currently being processed.
REQUEST_TYPE	VARCHAR	Type of request issued to a resource pool. End users always see this column set to Reserve, to indicate that the request is query-specific.
POOL_ID / POOL_NAME	INTEGER / VARCHAR	Each resource pool that participated in handling this request: <ul style="list-style-type: none"> • POOL_ID : A unique numeric ID assigned by the Vertica catalog that uniquely identifies the resource pool. • POOL_NAME : Name of the resource pool.
THREAD_COUNT	INTEGER	Number of threads in use by this request.
OPEN_FILE_HANDLE_COUNT	INTEGER	Number of open file handles in use by this request.

MEMORY_INUSE_KB	INTEGER	Total amount of memory in kilobytes acquired by this query. Column RESERVED_EXTRA_MEMORY_B in system table QUERY_PROFILES shows how much unused memory (in bytes) remains that is reserved for a given query but is unassigned to a specific operator. If operators for a query acquire all memory specified by MEMORY_INUSE_KB , the plan must request more memory from the Vertica Resource Manager.
QUEUE_ENTRY_TIMESTAMP	TIMESTAMPTZ	Timestamp when the request was queued in this resource pool.
ACQUISITION_TIMESTAMP	TIMESTAMPTZ	Timestamp when the request was admitted to run.
RELEASE_TIMESTAMP	TIMESTAMPTZ	Time when Vertica released this resource acquisition.
DURATION_MS	INTEGER	Duration in milliseconds of request execution. If the request cascaded across multiple resource pools, DURATION_MS applies only to this resource pool.
IS_EXECUTING	BOOLEAN	Set to true if the resource pool is still executing this request. A value of false can indicate one of the following: <ul style="list-style-type: none"> • The request was completed or denied. • The request cascaded to another resource pool.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

Queue wait time

You can calculate how long a resource pool queues a given request before it begins execution by subtracting **QUEUE_ENTRY_TIMESTAMP** from **ACQUISITION_TIMESTAMP** . For example:

```
=> SELECT pool_name, queue_entry_timestamp, acquisition_timestamp,
(acquisition_timestamp-queue_entry_timestamp) AS 'queue wait'
FROM V_MONITOR.RESOURCE_ACQUISITIONS WHERE node_name ILIKE '%node0001';
```

See also

- [RESOURCE_POOL_STATUS](#)
- [RESOURCE_POOLS](#)
- [RESOURCE_QUEUES](#)
- [RESOURCE_REJECTIONS](#)

RESOURCE_POOL_MOVE

Displays the cascade event information on each node.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Node name for which information is listed.
MOVE_TIMESTAMP	TIMESTAMPTZ	Time when the query attempted to move to the target pool.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
USER_ID	INTEGER	Identifies the query event user.
USER_NAME	VARCHAR	Name of the user for which Vertica lists query information at the time it records the session.
TRANSACTION_ID	INTEGER	Transaction identifier for the request.

STATEMENT_ID	INTEGER	Unique numeric ID for the statement.
SOURCE_POOL_NAME	VARCHAR	Name of the resource pool where the query was executing when Vertica attempted the move.
TARGET_POOL_NAME	VARCHAR	Name of resource pool where the query attempted to move.
MOVE_CAUSE	VARCHAR	Denotes why the query attempted to move. Valid values: <ul style="list-style-type: none"> • MOVE RESOURCE POOL COMMAND • RUNTIMECAP EXCEEDED
SOURCE_CAP	INTEGER	Effective RUNTIMECAP value for the source pool. The value represents the lowest of these three values: <ul style="list-style-type: none"> • session RUNTIMECAP • user RUNTIMECAP • source pool RUNTIMECAP
TARGET_CAP	INTEGER	Effective RUNTIMECAP value for the target pool. The value represents the lowest of these three values: <ul style="list-style-type: none"> • session RUNTIMECAP • user RUNTIMECAP • target pool RUNTIMECAP
SUCCESS	BOOLEAN	True, if the query successfully moved to the target pool.
RESULT_REASON	VARCHAR	States reason for success or failure of the move.

See also

- [QUERY_PROFILES](#)

- [RESOURCE_QUEUES](#)
- [RESOURCE_REJECTIONS](#)

RESOURCE_POOL_STATUS

Provides current state of [built-in](#) and user-defined resource pools on each node. Information includes:

- Current memory usage
- Resources requested and acquired by various requests
- Number of queries executing

For general information about resource pools, see [Resource pool architecture](#).

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node for which information is provided.
POOL_OID	INTEGER	Unique numeric ID that identifies the pool and is assigned by the Vertica catalog.
POOL_NAME	VARCHAR	Name of the resource pool.

IS_INTERNAL	BOOLEAN	Denotes whether a pool is built-in .
MEMORY_SIZE_KB	INTEGER	Value of MEMORYSIZE setting of the pool in kilobytes.
MEMORY_SIZE_ACTUAL_KB	INTEGER	Current amount of memory, in kilobytes, allocated to the pool by the resource manager. The actual size can be less than specified in the DDL, if both the following conditions exist: <ul style="list-style-type: none"> The pool has been recently altered in a running system. The request to shuffle memory is pending.
MEMORY_INUSE_KB	INTEGER	Amount of memory, in kilobytes, acquired by requests running against this pool.
GENERAL_MEMORY_BORROWED_KB	INTEGER	Amount of memory, in kilobytes, borrowed from the GENERAL pool by requests running against this pool. The sum of MEMORY_INUSE_KB and GENERAL_MEMORY_BORROWED_KB should be less than MAX_MEMORY_SIZE_KB .
QUEUEING_THRESHOLD_KB	INTEGER	Calculated as $MAX_MEMORY_SIZE_KB * 0.95$. When the amount of memory used by all requests against this resource pool exceeds the QUEUEING_THRESHOLD_KB , new requests against the pool are queued until memory becomes available.
MAX_MEMORY_SIZE_KB	INTEGER	Value, in kilobytes, of the MAXMEMORYSIZE parameter as defined for the pool. After this threshold is reached, new requests against this pool are rejected or queued until memory becomes available. <div style="background-color: #e6f2ff; padding: 10px; margin-top: 10px;"> <p>Note</p> <p>MAX_MEMORY_SIZE_KB might not reflect the set MAXMEMORYSIZE parameter value if the specified value cannot be reached. For example, if MAXMEMORYSIZE = 10G but less than 2G is available, MAX_MEMORY_SIZE_KB will not reflect the original value in KB. Instead, it will display only 2G in KB, as that is the highest value available to it.</p> </div>
MAX_QUERY_MEMORY_SIZE_KB	INTEGER	Value, in kilobytes, of the MAXQUERYMEMORYSIZE parameter as defined for the pool. The resource pool limits this amount of memory to all queries that execute in it.
RUNNING_QUERY_COUNT	INTEGER	Number of queries currently executing in this pool.
PLANNED_CONCURRENCY	INTEGER	Value of PLANNEDCONCURRENCY parameter as defined for the pool.
MAX_CONCURRENCY	INTEGER	Value of MAXCONCURRENCY parameter as defined for the pool.
IS_STANDALONE	BOOLEAN	If the pool is configured to have MEMORYSIZE equal to MAXMEMORYSIZE , the pool is considered standalone because it does not borrow any memory from the General pool.
QUEUE_TIMEOUT	INTERVAL	The interval that the request waits for resources to become available before being rejected. If you set this value to NONE, Vertica displays it as NULL.
QUEUE_TIMEOUT_IN_SECONDS	INTEGER	Value of QUEUETIMEOUT parameter as defined for the pool. If QUEUETIMEOUT is set to NONE, Vertica displays this value as NULL.
EXECUTION_PARALLELISM	INTEGER	Limits the number of threads used to process any single query issued in this resource pool.
PRIORITY	INTEGER	Value of PRIORITY parameter as defined for the pool. When set to HOLD , Vertica sets a pool's priority to -999 so the query remains queued until QUEUETIMEOUT is reached.

RUNTIMECAP_IN_SECONDS	INTEGER	Defined for this pool by parameter RUNTIMECAP , specifies in seconds the maximum time a query in the pool can execute. If a query exceeds this setting, it tries to cascade to a secondary pool.
RUNTIME_PRIORITY	VARCHAR	Defined for this pool by parameter RUNTIMEPRIORITY , determines how the resource manager should prioritize dedication of run-time resources (CPU, I/O bandwidth) to queries already running in this resource pool.
RUNTIME_PRIORITY_THRESHOLD	INTEGER	Defined for this pool by parameter RUNTIMEPRIORITYTHRESHOLD , specifies in seconds a time limit in which a query must finish before the resource manager assigns to it the resource pool's RUNTIME_PRIORITY setting.
SINGLE_INITIATOR	BOOLEAN	Set for backward compatibility.
QUERY_BUDGET_KB	INTEGER	The current amount of memory that queries are tuned to use. The calculation that Vertica uses to determine this value is described in Query budgeting . Note The calculated value can change when one or more running queries needs more than the budgeted amount to run. For a detailed example of query budget calculations, see Do You Need to Put Your Query on a Budget? in the Vertica User Community .
CPU_AFFINITY_SET	VARCHAR	The set of CPUs on which queries associated with this pool are executed. Can be: <ul style="list-style-type: none"> • A percentage of CPUs on the system • A zero-based list of CPUs (a four-CPU system c of CPUs 0, 1, 2, and 3).
CPU_AFFINITY_MASK	VARCHAR	The bit mask of CPUs available for use in this pool, read from right to left. See Examples below.
CPU_AFFINITY_MODE	VARCHAR	The mode for the CPU affinity, one of the following: <ul style="list-style-type: none"> • ANY • EXCLUSIVE • SHARED

Examples

The following query returns bit masks that show CPU assignments for three user-defined resource pools. Resource pool **bigqueries** runs queries on CPU 0, **ceo_pool** on CPU 1, and **testrp** on CPUs 0 and 1:

```
=> SELECT pool_name, node_name, cpu_affinity_set, cpu_affinity_mode,
  TO_BITSTRING(CPU_AFFINITY_MASK::VARBINARY) "CPU Affinity Mask"
  FROM resource_pool_status WHERE IS_INTERNAL = 'false' order by pool_name, node_name;
```

pool_name	node_name	cpu_affinity_set	cpu_affinity_mode	CPU Affinity Mask
bigqueries	v_vmart_node0001	0	SHARED	00110001
bigqueries	v_vmart_node0002	0	SHARED	00110001
bigqueries	v_vmart_node0003	0	SHARED	00110001
ceo_pool	v_vmart_node0001	1	SHARED	00110010
ceo_pool	v_vmart_node0002	1	SHARED	00110010
ceo_pool	v_vmart_node0003	1	SHARED	00110010
testrp	v_vmart_node0001	0-1	SHARED	00110011
testrp	v_vmart_node0002	0-1	SHARED	00110011
testrp	v_vmart_node0003	0-1	SHARED	00110011

RESOURCE_QUEUES

Provides information about requests pending for various resource pools.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The name of the node for which information is listed.
TRANSACTION_ID	INTEGER	Transaction identifier for this request
STATEMENT_ID	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID uniquely identifies a statement within a session.
POOL_NAME	VARCHAR	The name of the resource pool
MEMORY_REQUESTED_KB	INTEGER	Amount of memory in kilobytes requested by this request
PRIORITY	INTEGER	Value of PRIORITY parameter specified when defining the pool.
POSITION_IN_QUEUE	INTEGER	Position of this request within the pool's queue
QUEUE_ENTRY_TIMESTAMP	TIMESTAMP	Timestamp when the request was queued

See also

- [RESOURCE_ACQUISITIONS](#)
- [RESOURCE_POOLS](#)
- [RESOURCE_REJECTIONS](#)

RESOURCE_REJECTION_DETAILS

Records an entry for each resource request that Vertica denies. This is useful for determining if there are resource space issues, as well as which users/pools encounter problems.

Column Name	Data Type	Description
REJECTED_TIMESTAMP	TIMESTAMPTZ	Time when Vertica rejected the resource.
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
USER_NAME	VARCHAR	Name of the user at the time Vertica recorded the session.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
REQUEST_ID	INTEGER	Unique identifier of the query request in the user session.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any; otherwise NULL .

STATEMENT_ID	INTEGER	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID, STATEMENT_ID, and REQUEST_ID uniquely identifies a statement within a session.
POOL_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the resource pool.
POOL_NAME	VARCHAR	Name of the resource pool
REASON	VARCHAR	Reason for rejecting this request; for example: <ul style="list-style-type: none"> • Usage of single request exceeds high limit • Timed out waiting for resource reservation • Canceled waiting for resource reservation
RESOURCE_TYPE	VARCHAR	Memory, threads, file handles or execution slots. The following list shows the resources that are limited by the resource manager . A query might need some amount of each resource, and if the amount needed is not available, the query is queued and could eventually time out of the queue and be rejected. <ul style="list-style-type: none"> • Number of running plans • Number of running plans on initiator node (local) • Number of requested threads • Number of requested file handles • Number of requested KB of memory • Number of requested KB of address space <p>Note: Execution slots are determined by MAXCONCURRENCY parameter.</p>
REJECTED_VALUE	INTEGER	Amount of the specific resource requested by the last rejection

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

[RESOURCE_REJECTIONS](#)

RESOURCE_REJECTIONS

Monitors requests for resources that are rejected by the [Resource manager](#). Information is valid only as long as the node is up and the counters reset to 0 upon node restart.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
POOL_ID	INTEGER	Catalog-assigned integer value that uniquely identifies the resource pool.
POOL_NAME	VARCHAR	Name of the resource pool.
REASON	VARCHAR	Reason for rejecting this request, for example: <ul style="list-style-type: none"> • Usage of single request exceeds high limit • Timed out waiting for resource reservation • Canceled waiting for resource reservation

RESOURCE_TYPE	VARCHAR	<p>Memory, threads, file handles or execution slots.</p> <p>The following list shows the resources that are limited by the resource manager . A query might need some amount of each resource, and if the amount needed is not available, the query is queued and could eventually time out of the queue and be rejected.</p> <ul style="list-style-type: none"> • Number of running plans • Number of running plans on initiator node (local) • Number of requested threads • Number of requested file handles • Number of requested KB of memory • Number of requested KB of address space <div style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p>Note Execution slots are determined by MAXCONCURRENCY parameter.</p> </div>
REJECTION_COUNT	INTEGER	Number of requests rejected due to specified reason and RESOURCE_TYPE .
FIRST_REJECTED_TIMESTAMP	TIMESTAMPZ	Time of the first rejection for this pool.
LAST_REJECTED_TIMESTAMP	TIMESTAMPZ	Time of the last rejection for this pool.
LAST_REJECTED_VALUE	INTEGER	Amount of the specific resource requested by the last rejection.

Examples

```
=> SELECT node_name, pool_name, reason, resource_type, rejection_count AS count, last_rejected_value AS value FROM resource_rejections;
node_name | pool_name | reason | resource_type | count | value
-----+-----+-----+-----+-----+-----
v_vmart_node0001 | sysquery | Request exceeded high limit | Memory(KB) | 1 | 8248449
(1 row)
```

RESOURCE_USAGE

Monitors system resource management on each node.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
REQUEST_COUNT	INTEGER	The cumulative number of requests for threads, file handles, and memory (in kilobytes).
LOCAL_REQUEST_COUNT	INTEGER	The cumulative number of local requests.
REQUEST_QUEUE_DEPTH	INTEGER	The current request queue depth.
ACTIVE_THREAD_COUNT	INTEGER	The current number of active threads.
OPEN_FILE_HANDLE_COUNT	INTEGER	The current number of open file handles.
MEMORY_REQUESTED_KB	INTEGER	The memory requested in kilobytes.
ADDRESS_SPACE_REQUESTED_KB	INTEGER	The address space requested in kilobytes.

ROS_USED_BYTES	INTEGER	The size of the ROS in bytes.
ROS_ROW_COUNT	INTEGER	The number of rows in the ROS.
RESOURCE_REQUEST_REJECT_COUNT	INTEGER	The number of rejected plan requests.
RESOURCE_REQUEST_TIMEOUT_COUNT	INTEGER	The number of resource request timeouts.
RESOURCE_REQUEST_CANCEL_COUNT	INTEGER	The number of resource request cancelations.
DISK_SPACE_REQUEST_REJECT_COUNT	INTEGER	The number of rejected disk write requests.
FAILED_VOLUME_REJECT_COUNT	INTEGER	The number of rejections due to a failed volume.
TOKENS_USED	INTEGER	For internal use only.
TOKENS_AVAILABLE	INTEGER	For internal use only.

SESSION_MARS_STORE

Shows Multiple Active Result Sets (MARS) storage information.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
SESSION_ID	VARCHAR	Identifier of the Vertica session. This identifier is unique within the cluster for the current session but can be reused in a subsequent session.
USER_NAME	VARCHAR	The username used to create the connection.
RESULTSET_ID	INTEGER	Identifier assigned to the result set.
ROW_COUNT	INTEGER	Number of rows requested by the query.
REMAINING_ROW_COUNT	INTEGER	Number of rows that still need to be returned.
BYTES_USED	INTEGER	The number of bytes requested.

SESSION_PARAMETERS

Provides information about user-defined parameters ([UDPARAMETERS](#)) set for the current session.

Column Name	Data Type	Description
SESSION_ID	VARCHAR	The unique identifier for the session.
SCHEMA_NAME	VARCHAR	The name of the schema on which the session is running.
LIB_NAME	VARCHAR	The name of the user library running the UDX, if necessary.
LIB_OID	VARCHAR	The object ID of the library containing the function, if one is running.
PARAMETER_NAME	VARCHAR	The name of the session parameter.
CURRENT_VALUE	VARCHAR	The value of the session parameter.

See also

- [Configuration parameter management](#)
- [CONFIGURATION_PARAMETERS](#)

SESSION_PROFILES

Provides basic session parameters and lock time out data. To obtain information about sessions, see [Profiling database performance](#).

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
USER_NAME	VARCHAR	The name used to log in to the database or NULL if the session is internal.
CLIENT_HOSTNAME	VARCHAR	The host name and port of the TCP socket from which the client connection was made; NULL if the session is internal.
LOGIN_TIMESTAMP	TIMESTAMP	The date and time the user logged into the database or when the internal session was created. This field is useful for identifying sessions that have been left open for a period of time and could be idle.
LOGOUT_TIMESTAMP	TIMESTAMP	The date and time the user logged out of the database or when the internal session was closed.
SESSION_ID	VARCHAR	A unique numeric ID assigned by the Vertica catalog, which identifies the session for which profiling information is captured. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
EXECUTED_STATEMENT_SUCCESS_COUNT	INTEGER	The number of successfully run statements.
EXECUTED_STATEMENT_FAILURE_COUNT	INTEGER	The number of unsuccessfully run statements.
LOCK_GRANT_COUNT	INTEGER	The number of locks granted during the session.
DEADLOCK_COUNT	INTEGER	The number of deadlocks encountered during the session.
LOCK_TIMEOUT_COUNT	INTEGER	The number of times a lock timed out during the session.
LOCK_CANCELLATION_COUNT	INTEGER	The number of times a lock was canceled during the session.
LOCK_REJECTION_COUNT	INTEGER	The number of times a lock was rejected during a session.
LOCK_ERROR_COUNT	INTEGER	The number of lock errors encountered during the session.
CLIENT_TYPE	VARCHAR	The type of client from which the connection was made. Possible client type values: <ul style="list-style-type: none">• ADO.NET Driver• ODBC Driver• JDBC Driver• vsql
CLIENT_VERSION	VARCHAR	Returns the client version.
CLIENT_OS	VARCHAR	Returns the client operating system.
CLIENT_OS_USER_NAME	VARCHAR	The name of the user that logged into, or attempted to log into, the database. This is logged even when the login attempt is unsuccessful.

See also

[LOCKS](#)

SESSIONS

Monitors external sessions. Use this table to perform the following tasks:

- Identify users who are running lengthy queries.
- Identify users who hold locks because of an idle but uncommitted transaction.
- Determine the details of the database security used for a particular session, either Secure Socket Layer (SSL) or client authentication.
- Identify client-specific information, such as client version.

Note

During session initialization and termination, you might see sessions running only on nodes other than the node on which you ran the virtual table query. This is a temporary situation that corrects itself when session initialization and termination complete.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
USER_NAME	VARCHAR	The name used to log in to the database or NULL if the session is internal.
CLIENT_OS_HOSTNAME	VARCHAR	The hostname of the client as reported by their operating system.
CLIENT_HOSTNAME	VARCHAR	The IP address and port of the TCP socket from which the client connection was made; NULL if the session is internal. Vertica accepts either IPv4 or IPv6 connections from a client machine. If the client machine contains mappings for both IPv4 and IPv6, the server randomly chooses one IP address family to make a connection. This can cause the CLIENT_HOSTNAME column to display either IPv4 or IPv6 values, based on which address family the server chooses.
CLIENT_PID	INTEGER	The process identifier of the client process that issued this connection. Remember that the client process could be on a different machine than the server.
LOGIN_TIMESTAMP	TIMESTAMP	The date and time the user logged into the database or when the internal session was created. This field can help you identify sessions that have been left open for a period of time and could be idle.
SESSION_ID	VARCHAR	The identifier required to close or interrupt a session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
IDLE_SESSION_TIMEOUT	VARCHAR	Specifies how long this session can remain idle before timing out, set by SET SESSION IDLESESSIONTIMEOUT .
GRACE_PERIOD	VARCHAR	Specifies how long a session socket remains blocked while awaiting client input or output for a given query, set by SET SESSION GRACEPERIOD . If the socket is blocked for a continuous period that exceeds the grace period setting, the server shuts down the socket and throws a fatal error. The session is then terminated.
CLIENT_LABEL	VARCHAR	A user-specified label for the client connection that can be set when using ODBC. See Label in ODBC DSN connection properties . An MC output value means there are is a client connection to an MC-managed database for that USER_NAME
TRANSACTION_START	DATE	The date/time the current transaction started or NULL if no transaction is running.
TRANSACTION_ID	INTEGER	A string containing the hexadecimal representation of the transaction ID, if any; otherwise, NULL.

TRANSACTION_DESCRIPTION	VARCHAR	Description of the current transaction.
STATEMENT_START	TIMESTAMP	The timestamp the current statement started execution, or NULL if no statement is running.
STATEMENT_ID	INTEGER	A unique numeric ID assigned by the Vertica catalog, which identifies the currently-executing statement. A value of NULL indicates that no statement is currently being processed.
LAST_STATEMENT_DURATION_US	INTEGER	The duration of the last completed statement in microseconds.
RUNTIME_PRIORITY	VARCHAR	Specifies how many run-time resources (CPU, I/O bandwidth) are allocated to queries that are running in the resource pool.
CURRENT_STATEMENT	VARCHAR	The currently executing statement, if any. NULL indicates that no statement is currently being processed.
LAST_STATEMENT	VARCHAR	NULL if the user has just logged in; otherwise the currently running statement or the most recently completed statement.
SSL_STATE	VARCHAR	Indicates if Vertica used Secure Socket Layer (SSL) for a particular session. Possible values are: <ul style="list-style-type: none"> • None—Vertica did not use SSL. • Server—Server authentication was used, so the client could authenticate the server. • Mutual—Both the server and the client authenticated one another through mutual authentication. See Security and authentication and TLS protocol .
AUTHENTICATION_METHOD	VARCHAR	The type of client authentication used for a particular session, if known. Possible values are: <ul style="list-style-type: none"> • Unknown • Trust • Reject • Hash • Ident • LDAP • GSS • TLS See Security and authentication and Configuring client authentication .
CLIENT_TYPE	VARCHAR	The type of client from which the connection was made. Possible client type values: <ul style="list-style-type: none"> • ADO.NET Driver • ODBC Driver • JDBC Driver • vsql
CLIENT_VERSION	VARCHAR	Client version.
CLIENT_OS	VARCHAR	Client operating system.
CLIENT_OS_USER_NAME	VARCHAR	The name of the user that logged into, or attempted to log into, the database. This is logged even when the login attempt is unsuccessful.

CLIENT_AUTHENTICATION_NAME	VARCHAR	User-assigned name of the authentication method.
CLIENT_AUTHENTICATION	INTEGER	Object identifier of the client authentication method.
REQUESTED_PROTOCOL	INTEGER	The requested Vertica client server protocol to be used when connecting.
EFFECTIVE_PROTOCOL	INTEGER	The requested Vertica client server protocol used when connecting.
EXTERNAL_MEMORY_KB	INTEGER	Amount of memory consumed by the Java Virtual Machines associated with the session.

Privileges

A superuser has unrestricted access to all session information. Users can view information only about their own, current sessions.

See also

- [CLOSE_SESSION](#)
- [CLOSE_ALL_SESSIONS](#)

SPREAD_STATE

Lists [Spread](#) daemon settings for all nodes in the cluster.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Which node the settings are for.
TOKEN_TIMEOUT	INTEGER	The timeout period in milliseconds before spread considers a node to be down due to lack of response to a message.

Examples

```
=> SELECT * FROM V_MONITOR.SPREAD_STATE;
  node_name | token_timeout
-----+-----
v_vmart_node0003 |      8000
v_vmart_node0001 |      8000
v_vmart_node0002 |      8000
(3 rows)
```

See also

- [Adjusting Spread Daemon timeouts for virtual environments](#)
- [SET_SPREAD_OPTION](#)

STATEMENT_OUTCOMES

Records consolidated information about session-level statements, which can consist of more than one operation and might include retries. For example, inserting into a table with a column constraint includes an INSERT query and a constraint check. STATEMENT_OUTCOMES has one row for the statement, and the related [QUERY_REQUESTS](#) table has two rows.

This table tracks only statements that are executed within transactions. Many meta-functions do not automatically open transactions.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that reported the requested information.
USER_NAME	VARCHAR	Name of the user who issued the query at the time Vertica recorded the session.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused after the session ends.

TRANSACTION_ID	INTEGER	Identifier for the transaction within the session. Statements that are not executed within transactions are not recorded in this table.
STATEMENT_ID	INTEGER	Unique identifier for the statement. The combination of TRANSACTION_ID and STATEMENT_ID uniquely identifies a user query within a session.
REQUEST_TYPE	VARCHAR	Type of the query request. Examples include, but are not limited to: <ul style="list-style-type: none"> • QUERY • DDL • LOAD • UTILITY • TRANSACTION • PREPARE • EXECUTE • SET • SHOW
REQUEST	VARCHAR	Query statement.
REQUEST_LABEL	VARCHAR	Label of the query, if any.
SEARCH_PATH	VARCHAR	Contents of the search path.
SUCCESS	BOOLEAN	Whether the statement succeeded.
ERROR	VARCHAR	If the statement did not succeed, the error message.
START_TIMESTAMP	TIMESTAMPTZ	Beginning of history interval.
END_TIMESTAMP	TIMESTAMPTZ	End of history interval.
REQUEST_DURATION	TIMESTAMPTZ	Statement execution time in days, hours, minutes, seconds, and milliseconds. This time includes all operations that make up the statement, including any retries.
REQUEST_DURATION_MS	INTEGER	Statement execution time in milliseconds. This time includes all operations that make up the statement, including any retries.
IS_EXECUTING	BOOLEAN	Whether the statement is currently running.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

See also

[QUERY_PROFILES](#)

STORAGE_BUNDLE_INFO_STATISTICS

Indicates which projections have storage containers with invalid bundle metadata in the database catalog. If any ROS or DV container has invalid bundle metadata fields, Vertica increments the corresponding column (`ros_without_bundle_info_count` or `dv_ros_without_bundle_info_count`) by one.

To update the catalog with valid bundle metadata, call `UPDATE_STORAGE_CATALOG` , as an argument to Vertica meta-function `DO_TM_TASK` . For details, see [Writing bundle metadata to the catalog](#) .

Column Name	Data Type	Description
<code>node_name</code>	VARCHAR	Name of this projection's node
<code>projection_oid</code>	INTEGER	Projection's unique catalog identifier
<code>projection_name</code>	VARCHAR	Projection name

projection_schema	VARCHAR	Projection schema name
total_ros_count	INTEGER	Total number of ROS containers for this projection
ros_without_bundle_info_count	INTEGER	Number of ROS containers for this projection with invalid bundle metadata
total_dv_ros_count	INTEGER	Total number of DV (delete vector) containers for this projection
dv_ros_without_bundle_info_count	INTEGER	Number of DV containers for this projection with invalid bundle metadata

STORAGE_CONTAINERS

Monitors information about Vertica storage containers.

Column Name	Data Type	Description
NODE_NAME *	VARCHAR	Node name for which information is listed.
NAMESPACE_NAME *	VARCHAR	For Eon Mode databases, namespace for which information is listed.
SCHEMA_NAME *	VARCHAR	Schema name for which information is listed. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
PROJECTION_ID *	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the projection.
PROJECTION_NAME *	VARCHAR	Projection name for which information is listed on that node.
STORAGE_OID *	INTEGER	Numeric ID assigned by the Vertica catalog, which identifies the storage. The same OID can appear on more than one node.
SAL_STORAGE_ID	VARCHAR	Unique hexadecimal numeric ID assigned by the Vertica catalog, which identifies the storage.
TOTAL_ROW_COUNT *	VARCHAR	Total rows in the storage container listed for that projection. If the database has been re-sharded, this value will be inaccurate until the Tuple mover realigns the storage containers to the new shard layout.
DELETED_ROW_COUNT *	INTEGER	Total rows in the storage container deleted for that projection. If the database has been re-sharded, this value will be inaccurate until the Tuple mover realigns the storage containers to the new shard layout.
USED_BYTES *	INTEGER	Number of bytes in the storage container used to store the compressed projection data. This value should not be compared to the output of the AUDIT function, which returns the raw data size of database objects. If the database has been re-sharded, this value will be inaccurate until the Tuple mover realigns the storage containers to the new shard layout.
START_EPOCH *	INTEGER	Number of the start epoch in the storage container for which information is listed.
END_EPOCH *	INTEGER	Number of the end epoch in the storage container for which information is listed.

GROUPING	VARCHAR	The group by which columns are stored: <ul style="list-style-type: none"> • ALL : All columns are grouped • PROJECTION : Columns grouped according to projection definition • NONE : No columns grouped, despite grouping in the projection definition • OTHER : Some grouping but neither all nor according to projection (e.g., results from add column)
SEGMENT_LOWER_BOUND	INTEGER	Lower bound of the segment range spanned by the storage container or NULL if the corresponding projection is not elastic.
SEGMENT_UPPER_BOUND	INTEGER	Upper bound of the segment range spanned by the storage container or NULL if the corresponding projection is not elastic.
LOCATION_LABEL	VARCHAR (128)	The location label (if any) for the storage container is stored.
DELETE_VECTOR_COUNT	INTEGER	The number of delete vectors in the storage container. If the database has been re-sharded, this value will be inaccurate until the Tuple mover realigns the storage containers to the new shard layout.
SHARD_ID	INTEGER	Set only for an Eon Mode database, ID of the shard that this container belongs to.
SHARD_NAME	VARCHAR(128)	Set only for an Eon Mode database, name of the shard that this container belongs to.
ORIGINAL_SEGMENT_LOWER_BOUND	INTEGER	The lower bound of a storage container before database re-sharding. This value is set only if the database has been re-sharded and the storage containers have not been realigned with current shard definitions. For details, see RESHARD_DATABASE .
ORIGINAL_SEGMENT_UPPER_BOUND	INTEGER	The upper bound of a storage container before database re-sharding. This value is set only if the database has been re-sharded and the storage container has not been realigned with current shard definitions. For details, see RESHARD_DATABASE .

* Column values cached for faster query performance

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

Examples

The following query identifies any storage containers that have not yet been realigned to the new shard segmentation bounds after running [RESHARD_DATABASE](#):

```
=> SELECT COUNT(*) FROM storage_containers WHERE original_segment_lower_bound IS NOT NULL AND original_segment_upper_bound IS NOT NULL;
```

STORAGE_POLICIES

Monitors the current storage policies in effect for one or more database objects.

Column Name	Data Type	Description
NAMESPACE_NAME	VARCHAR	For Eon Mode databases, namespace for which information is listed.

SCHEMA_NAME	VARCHAR	Schema name for which information is listed. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <code>n1.s</code> refers to schema <code>s</code> in namespace <code>n1</code> .
OBJECT_NAME	VARCHAR	The name of the database object associated through the storage policy.
POLICY_DETAILS	VARCHAR	The object type of the storage policy.
LOCATION_LABEL	VARCHAR (128)	The label for this storage location.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

See also

- [Viewing storage locations and policies](#)
- [PARTITIONS](#)

- [STORAGE_USAGE](#)

STORAGE_TIERS

Provides information about all storage locations with the same label across all cluster nodes. This table lists data totals for all same-name labeled locations.

The system table shows what labeled locations exist on the cluster, as well as other cluster-wide data about the locations.

Column Name	Data Type	Description
LOCATION_LABEL	VARCHAR	The label associated with a specific storage location. The <code>storage_tiers</code> system table includes data totals for unlabeled locations, which are considered labeled with empty strings (").
NODE_COUNT	INTEGER	The total number of nodes that include a storage location named <code>location_label</code> .
LOCATION_COUNT	INTEGER	The total number of storage locations named <code>location_label</code> . This value can differ from <code>node_count</code> if you create labeled locations with the same name at different paths on different nodes. For example: v_vmart_node0001: Create one labeled location, <code>FAST</code> V_vmart_node0002 : Create two labeled locations, <code>FAST</code> , at different directory paths In this case, <code>node_count</code> value = 2, while <code>location_count</code> value = 3.
ROS_CONTAINER_COUNT	INTEGER	The total number of ROS containers stored across all cluster nodes for <code>location_label</code> .
TOTAL_OCCUPIED_SIZE	INTEGER	The total number of bytes that all ROS containers for <code>location_label</code> occupy across all cluster nodes.

Privileges

None

See also

- [DISK_STORAGE](#)
- [STORAGE_POLICIES](#)
- [STORAGE_USAGE](#)
- [Storage functions](#)

STORAGE_USAGE

Provides information about file system storage usage. This is useful for determining disk space usage trends.

Column Name	Data Type	Description
POLL_TIMESTAMP	TIMESTAMPTZ	Time when Vertica recorded the row.
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
PATH	VARCHAR	Path where the storage location is mounted.
DEVICE	VARCHAR	Device on which the storage location is mounted.
FILESYSTEM	VARCHAR	File system on which the storage location is mounted.
USED_BYTES	INTEGER	Counter history of number of used bytes.
FREE_BYTES	INTEGER	Counter history of number of free bytes.
USAGE_PERCENT	FLOAT	Percent of storage in use.

Privileges

Superuser

STRATA

Contains internal details of how the [Tuple Mover](#) combines ROS containers in each projection, broken down by stratum and classifies the ROS containers by size and partition. The related [STRATA_STRUCTURES](#) table provides a summary of the strata values.

[Mergeout](#) describes how the Tuple Mover combines ROS containers.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
SCHEMA_NAME	VARCHAR	The schema name for which information is listed. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <code>n1.s</code> refers to schema <code>s</code> in namespace <code>n1</code> .
PROJECTION_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the projection.
PROJECTION_NAME	VARCHAR	The projection name for which information is listed on that node.
STRATUM_KEY	VARCHAR	References the partition or partition group for which information is listed.
STRATA_COUNT	INTEGER	The total number of strata for this projection partition.

MERGING_STRATA_COUNT	INTEGER	The number of strata the Tuple Mover can merge out.
STRATUM_CAPACITY	INTEGER	The maximum number of ROS containers for the stratum before they must be merged.
STRATUM_HEIGHT	FLOAT	The size ratio between the smallest and largest ROS container in this stratum.
STRATUM_NO	INTEGER	The stratum number. Strata are numbered starting at 0, for the stratum containing the smallest ROS containers.
STRATUM_LOWER_SIZE	VARCHAR	The smallest ROS container size allowed in this stratum.
STRATUM_UPPER_SIZE	VARCHAR	The largest ROS container size allowed in this stratum.
ROS_CONTAINER_COUNT	INTEGER	The current number of ROS containers in the projection partition.

STRATA_STRUCTURES

This table provides an overview of [Tuple Mover](#) internal details. It summarizes how the ROS containers are classified by size. A more detailed view can be found in the [STRATA](#) virtual table.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	The node name for which information is listed.
SCHEMA_NAME	VARCHAR	The schema name for which information is listed.
PROJECTION_NAME	VARCHAR	The projection name for which information is listed on that node.
PROJECTION_ID	INTEGER	Catalog-assigned numeric value that uniquely identifies the projection.
STRATUM_KEY	VARCHAR	References the partition or partition group for which information is listed.
STRATA_COUNT	INTEGER	The total number of strata for this projection partition.
MERGING_STRATA_COUNT	INTEGER	In certain hardware configurations, a high strata could contain more ROS containers than the Tuple Mover can merge out; output from this column denotes the number of strata the Tuple Mover can merge out.
STRATUM_CAPACITY	INTEGER	The maximum number of ROS containers that the strata can contained before it must merge them.
STRATUM_HEIGHT	FLOAT	The size ratio between the smallest and largest ROS container in a stratum.
ACTIVE_STRATA_COUNT	INTEGER	The total number of strata that have ROS containers in them.

Examples

```
=> \pset expanded
Expanded display is on.
=> SELECT node_name, schema_name, projection_name, strata_count,

```

Monitors the overall state of the database.

Column Name	Data Type	Description
CURRENT_EPOCH	INTEGER	The current epoch number.
AHM_EPOCH	INTEGER	The AHM epoch number.
LAST_GOOD_EPOCH	INTEGER	The smallest (min) of all the checkpoint epochs on the cluster.
REFRESH_EPOCH	INTEGER	Deprecated, always set to -1.
DESIGNED_FAULT_TOLERANCE	INTEGER	The designed or intended K-safety level.
NODE_COUNT	INTEGER	The number of nodes in the cluster.
NODE_DOWN_COUNT	INTEGER	The number of nodes in the cluster that are currently down.
CURRENT_FAULT_TOLERANCE	INTEGER	The number of node failures the cluster can tolerate before it shuts down automatically. This is the current K-safety level.
CATALOG_REVISION_NUMBER	INTEGER	The catalog version number.
ROS_USED_BYTES	INTEGER	The ROS size in bytes (cluster-wide).
ROS_ROW_COUNT	INTEGER	The number of rows in ROS (cluster-wide).
TOTAL_USED_BYTES	INTEGER	The total storage in bytes across the database cluster.
TOTAL_ROW_COUNT	INTEGER	The total number of rows across the database cluster.

SYSTEM_RESOURCE_USAGE

Provides history about system resources, such as memory, CPU, network, disk, I/O.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
END_TIME	TIMESTAMP	End time of the history interval.
AVERAGE_MEMORY_USAGE_PERCENT	FLOAT	Average memory usage in percent of total memory (0-100) during the history interval.
AVERAGE_CPU_USAGE_PERCENT	FLOAT	Average CPU usage in percent of total CPU time (0-100) during the history interval.
NET_RX_KBYTES_PER_SECOND	FLOAT	Average number of kilobytes received from network (incoming) per second during the history interval.
NET_TX_KBYTES_PER_SECOND	FLOAT	Average number of kilobytes transmitting to network (outgoing) per second during the history interval.
IO_READ_KBYTES_PER_SECOND	FLOAT	Disk I/O average number of kilobytes read from disk per second during the history interval.
IO_WRITTEN_KBYTES_PER_SECOND	FLOAT	Average number of kilobytes written to disk per second during the history interval.

Privileges

Superuser

SYSTEM_SERVICES

Provides information about background system services that [Workload Analyzer](#) monitors.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
SERVICE_TYPE	VARCHAR	Type of service; can be one of: <ul style="list-style-type: none">• SYSTEM• TUPLE MOVER
SERVICE_GROUP	VARCHAR	Group name, if there are multiple services of the same type.
SERVICE_NAME	VARCHAR	Name of the service.
SERVICE_INTERVAL_SEC	INTEGER	How often the service is executed (in seconds) during the history interval.
IS_ENABLED	BOOLEAN	Denotes if the service is enabled.
LAST_RUN_START	TIMESTAMPTZ	Denotes when the service was started last time.
LAST_RUN_END	TIMESTAMPTZ	Denotes when the service was completed last time.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

SYSTEM_SESSIONS

Provides information about system internal session history by system task.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
USER_NAME	VARCHAR	Name of the user at the time Vertica recorded the session.
SESSION_ID	INTEGER	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, TRANSACTION_ID returns NULL.
STATEMENT_ID	VARCHAR	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID and STATEMENT_ID uniquely identifies a statement within a session.

SESSION_TYPE	VARCHAR	Session type, one of: <ul style="list-style-type: none"> • CLIENT • DBD • MERGEOUT • REBALANCE_CLUSTER • RECOVERY • REFRESH • TIMER_SERVICE • CONNECTION • SUBSESSION • REPARTITION_TABLE • LICENSE_AUDIT • STARTUP • SHUTDOWN • VSPREAD
RUNTIME_PRIORITY	VARCHAR	Specifies how many run-time resources (CPU, I/O bandwidth) are allocated to queries that are running in the resource pool.
DESCRIPTION	VARCHAR	Transaction description in this session.
SESSION_START_TIMESTAMP	TIMESTAMPTZ	Value of session at beginning of history interval.
SESSION_END_TIMESTAMP	TIMESTAMPTZ	Value of session at end of history interval.
IS_ACTIVE	BOOLEAN	Denotes if the session is still running.
SESSION_DURATION_MS	INTEGER	Duration of the session in milliseconds.
CLIENT_TYPE	VARCHAR	Columns not used in SYSTEM_SESSIONS system table. To view values for these columns, see the V_MONITOR schema system tables SESSIONS , USER_SESSIONS , CURRENT_SESSION , and SESSION_PROFILES .
CLIENT_VERSION	VARCHAR	
CLIENT_OS	VARCHAR	
CLIENT_OS_USER_NAME	VARCHAR	
CLIENT_OS_USER_NAME	VARCHAR	The name of the user that logged into, or attempted to log into, the database. This is logged even when the login attempt is unsuccessful.

Privileges

Superuser

TABLE_RECOVERIES

Provides detailed information about recovered and recovering tables during a [recovery by table](#).

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is performing the recovery.
TABLE_NAME	VARCHAR	The name of the table being recovered.
TABLE_OID	INTEGER	The object ID of the table being recovered.

STATUS	VARCHAR	The status of the table. Tables can have the following status: <ul style="list-style-type: none"> recovered: The table is fully recovered recovering: The table is in the process of recovery error_retry: Vertica has attempted to recover the table, but the recovery failed. Tables that have not yet begun the recovery process do not have a status.
PHASE	VARCHAR	The phase of the recovery .
THREAD_ID	VARCHAR	The ID of the thread that performed the recovery.
START_TIME	TIMESTAMPTZ	The date and time that the table began recovery.
END_TIME	TIMESTAMPTZ	The date and time that the table completed recovery.
RECOVER_PRIORITY	INTEGER	The recovery priority of the table being recovered.
RECOVER_ERROR	VARCHAR	Error that caused the recovery to fail.
IS_HISTORICAL	BOOLEAN	If <code>f</code> , the record contains recovery information for the current process.

Privileges

None

Examples

```
=> SELECT * FROM TABLE_RECOVERIES;
-[RECORD 1]-----
node_name      | node04

```

TABLE_RECOVERY_STATUS

Provides node recovery information during a [Recovery By Table](#).

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is performing the recovery.

NODE_RECOVERY_START_TIME	TIMESTAMPTZ	The timestamp for when the node began recovering.
RECOVER_EPOCH	INTEGER	The epoch that the recovery operation is trying to recover to.
RECOVERING_TABLE_NAME	VARCHAR	The name of the table currently recovering.
TABLES_REMAIN	INTEGER	The total number of tables on the node.
IS_RUNNING	BOOLEAN	Indicates if the recovery process is still running.

Privileges

None

Examples

```
=> SELECT * FROM TABLE_RECOVERY_STATUS;
-[ RECORD 1 ]-----+-----
node_name          | v_vmart_node0001
node_recovery_start_time |
recover_epoch      |
recovering_table_name |
tables_remain      | 0
is_running         | f
-[ RECORD 2 ]-----+-----
node_name          | v_vmart_node0002

node_recovery_start_time | 2017-12-13 08:47:28.282377-05
recover_epoch      | 23
recovering_table_name | user_table
tables_remain      | 5
is_running         | y
```

TABLE_STATISTICS

Displays statistics that have been collected for tables and their respective partitions.

Column Name	Data Type	Description
LOGICAL_STATS_OID	INTEGER	Uniquely identifies a collection of statistics for a given table.
TABLE_NAME	VARCHAR	Name of an existing database table.
MIN_PARTITION_KEY, MAX_PARTITION_KEY	VARCHAR	Statistics for a range of partition keys collected by ANALYZE_STATISTICS_PARTITION , empty if statistics were collected by ANALYZE_STATISTICS .
ROW_COUNT	INTEGER	The number of rows analyzed for each statistics collection.
STAT_COLLECTION_TIME	TIMESTAMPTZ	The timestamp of each statistics collection.

TLS_CONFIGURATIONS

Lists settings for TLS Configuration objects for the server, LDAP, etc.

Column Name	Data Type	Description
NAME	VARCHAR	Name of the TLS Configuration. Vertica includes the following TLS Configurations by default: <ul style="list-style-type: none"> • server • LDAPLink • LDAPAuth • data_channel
OWNER	VARCHAR	Owner of the TLS Configuration object.
CERTIFICATE	VARCHAR	The certificate associated with the TLS Configuration object.
CA_CERTIFICATES	VARCHAR	The CA certificate(s) used to verify client certificates. In cases where a TLS Configuration uses more than one CA, each CA will have its own row in the table.
CIPHER_SUITES	VARCHAR	The cipher suites to used to secure the connection.
MODE	VARCHAR	How Vertica establishes TLS connections with another host, one of the following, in order of ascending security: <ul style="list-style-type: none"> • DISABLE : Disables TLS. All other options for this parameter enable TLS. • ENABLE : Enables TLS. Vertica does not check client certificates. • TRY_VERIFY : Establishes a TLS connection if one of the following is true: <ul style="list-style-type: none"> ◦ the other host presents a valid certificate ◦ the other host doesn't present a certificate If the other host presents an invalid certificate, the connection will use plaintext. • VERIFY_CA : Connection succeeds if Vertica verifies that the other host's certificate is from a trusted CA. If the other host does not present a certificate, the connection uses plaintext. • VERIFY_FULL : Connection succeeds if Vertica verifies that the other host's certificate is from a trusted CA and the certificate's cn (Common Name) or subjectAltName attribute matches the hostname or IP address of the other host. Note that for client certificates, cn is used for the username, so subjectAltName must match the hostname or IP address of the other host. <p>VERIFY_FULL is unsupported for client-server TLS (the connection type handled by ServerTLSConfig) and behaves as VERIFY_CA .</p>

Examples

In this example, the LDAPAuth TLS Configuration uses two CA certificates:

```
=> SELECT * FROM tls_configurations WHERE name='LDAPAuth';
  name | owner | certificate | ca_certificate | cipher_suites | mode
-----+-----+-----+-----+-----+-----
LDAPAuth | dbadmin | server_cert | ca          |              | DISABLE
LDAPAuth | dbadmin | server_cert | ica        |              | DISABLE
(2 rows)
```

To make more clear the relationship between a TLS Configuration and its CA certificates, you can format the query with [LISTAGG](#):

```

=> SELECT name, owner, certificate, LISTAGG(ca_certificate) AS ca_certificates, cipher_suites, mode
FROM tls_configurations
WHERE name='LDAPAuth'
GROUP BY name, owner, certificate, cipher_suites, mode
ORDER BY 1;
name | owner | certificate | ca_certificates | cipher_suites | mode
-----+-----+-----+-----+-----+-----
LDAPAuth | dbadmin | server_cert | ca,ica | | DISABLE
(1 row)

```

TRANSACTIONS

Records the details of each transaction.

Column Name	Data Type	Description
START_TIMESTAMP	TIMESTAMPTZ	Beginning of history interval.
END_TIMESTAMP	TIMESTAMPTZ	End of history interval.
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
USER_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the user.
USER_NAME	VARCHAR	Name of the user for which transaction information is listed.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any; otherwise NULL .
DESCRIPTION	VARCHAR	Textual description of the transaction.
START_EPOCH	INTEGER	Number of the start epoch for the transaction.
END_EPOCH	INTEGER	Number of the end epoch for the transaction
NUMBER_OF_STATEMENTS	INTEGER	Number of query statements executed in this transaction.
ISOLATION	VARCHAR	Denotes the transaction mode as "READ COMMITTED" or "SERIALIZABLE".
IS_READ_ONLY	BOOLEAN	Denotes "READ ONLY" transaction mode.
IS_COMMITTED	BOOLEAN	Determines if the transaction was committed. False means ROLLBACK.
IS_LOCAL	BOOLEAN	Denotes transaction is local (non-distributed).
IS_INITIATOR	BOOLEAN	Denotes if the transaction occurred on this node (t).
IS_DDL	BOOLEAN	Distinguishes between a DDL transaction (t) and non-DDL transaction (f).

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

See also

[Transactions](#)

TRUNCATED_SCHEMATA

Lists the original names of restored schemas that were truncated due to name lengths exceeding 128 characters.

Column Name	Data Type	Description
RESTORE_TIME	TIMESTAMPTZ	The time that the table was restored.
SESSION_ID	VARCHAR	Identifier for the restoring session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
USER_ID	INTEGER	Identifier of the user for the restore event.
USER_NAME	VARCHAR	Name of the user for which Vertica lists restore information at the time it recorded the session.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any; otherwise NULL.
ORIGINAL_SCHEMA_NAME	VARCHAR	The original name of the schema prior to the restore.
NEW_SCHEMA_NAME	VARCHAR	The name of the schema after it was truncated.

Privileges

None

TUNING_RECOMMENDATIONS

Returns tuning recommendation results from the last call to [ANALYZE_WORKLOAD](#). This information is useful for building filters on the Workload Analyzer result set.

Column Name	Data Type	Description
OBSERVATION_COUNT	INTEGER	Integer for the total number of events observed for this tuning recommendation. For example, if you see a return value of 1, Workload Analyzer is making its first tuning recommendation for the event in 'scope'.
FIRST_OBSERVATION_TIME	TIMESTAMPTZ	Timestamp when the event first occurred. If this column returns a null value, the tuning recommendation is from the current status of the system instead of from any prior event.
LAST_OBSERVATION_TIME	TIMESTAMPTZ	Timestamp when the event last occurred. If this column returns a null value, the tuning recommendation is from the current status of the system instead of from any prior event.
TUNING_PARAMETER	VARCHAR	Objects on which to perform a tuning action. For example, a return value of: <ul style="list-style-type: none"> public.t informs the DBA to run Database Designer on table t in the public schema bsmith notifies a DBA to set a password for user bsmith
TUNING_DESCRIPTION	VARCHAR	Textual description of the tuning recommendation to perform on the tuning_parameter object. For example: <ul style="list-style-type: none"> Run database designer on table schema.table Create replicated projection for table schema.table Consider incremental design on query Re-segment projection projection-name on high-cardinality column(s) Drop the projection projection-name Alter a table's partition expression Reorganize data in partitioned table Decrease the MoveOutInterval configuration parameter setting

TUNING_COMMAND	VARCHAR	<p>Command string if tuning action is a SQL command. For example:</p> <p>Update statistics on a particular schema's table.column:</p> <pre>SELECT ANALYZE_STATISTICS('public.table.column');</pre> <p>Resolve mismatched configuration parameter LockTimeout:</p> <pre>SELECT * FROM CONFIGURATION_PARAMETERS WHERE parameter_name = 'LockTimeout';</pre> <p>Set the password for user <code>bsmith</code> :</p> <pre>ALTER USER (bsmith) IDENTIFIED BY ('new_password');</pre>
TUNING_COST	VARCHAR	<p>Cost is based on the type of tuning recommendation and is one of:</p> <ul style="list-style-type: none"> • LOW : minimal impact on resources from running the tuning command • MEDIUM : moderate impact on resources from running the tuning command • HIGH : maximum impact on resources from running the tuning command <p>Depending on the size of your database or table, consider running high-cost operations after hours instead of during peak load times.</p>

Privileges

Superuser

Examples

See [ANALYZE_WORKLOAD](#).

TUPLE_MOVER_OPERATIONS

Monitors the status of [Tuple Mover](#) operations on each node.

Column Name	Data Type	Description
OPERATION_START_TIMESTAMP	TIMESTAMP	Start time of a Tuple Mover operation.
NODE_NAME	VARCHAR	Node name for which information is listed.
OPERATION_NAME	VARCHAR	<p>One of the following:</p> <ul style="list-style-type: none"> • Analyze Statistics • DVMergeout • Mergeout • Partitioning • Rebalance • Recovery Replay Delete

OPERATION_STATUS	VARCHAR	Returns the status of each operation, one of the following: <ul style="list-style-type: none"> • Empty string: not running • Start • Running • Complete • Update • Abort • Change plan type to Replay Delete
TABLE_SCHEMA	VARCHAR	Schema name for the specified projection. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, <code>n1.s</code> refers to schema <code>s</code> in namespace <code>n1</code> .
TABLE_NAME	VARCHAR	Table name for the specified projection.
PROJECTION_NAME	VARCHAR	Name of the projection being processed.
PROJECTION_ID	INTEGER	Unique numeric ID assigned by the Vertica catalog, which identifies the projection.
COLUMN_ID	INTEGER	Identifier for the column for the associated projection being processed.
EARLIEST_CONTAINER_START_EPOCH	INTEGER	Populated for mergeout and purge operations only. For an automatically-invoked mergeout, for example, the returned value represents the lowest epoch of containers involved in the mergeout.
LATEST_CONTAINER_END_EPOCH	INTEGER	Populated for mergeout and purge_partitions operations. For an automatically-invoked mergeout, for example, the returned value represents the highest epoch of containers involved in the mergeout.
ROS_COUNT	INTEGER	Number of ROS containers.
TOTAL_ROS_USED_BYTES	INTEGER	Size in bytes of all ROS containers in the mergeout operation. (Not applicable for other operations.)
PLAN_TYPE	VARCHAR	One of the following: <ul style="list-style-type: none"> • Analyze Statistics • DVMergeout • Mergeout • Partitioning • Rebalance • Recovery Replay Delete • Replay Delete
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
TRANSACTION_ID	INTEGER	Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, <code>TRANSACTION_ID</code> returns NULL.
IS_EXECUTING	BOOLEAN	Distinguishes between actively-running (t) and completed (f) tuple mover operations.

RUNTIME_PRIORITY	VARCHAR	Determines how many run-time resources (CPU, I/O bandwidth) the Resource Manager should dedicate to running queries in the resource pool, one of the following: <ul style="list-style-type: none"> • HIGH • MEDIUM • LOW
------------------	---------	---

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

Examples

```
=> SELECT node_name, operation_status, projection_name, plan_type
FROM TUPLE_MOVER_OPERATIONS;
```

```
node_name      | operation_status | projection_name | plan_type
```

```
-----+-----+-----+-----
v_vmart_node0001 | Running      | p1_b2         | Mergeout
v_vmart_node0002 | Running      | p1            | Mergeout
v_vmart_node0001 | Running      | p1_b2         | Replay Delete
v_vmart_node0001 | Running      | p1_b2         | Mergeout
v_vmart_node0002 | Running      | p1_b2         | Mergeout
v_vmart_node0001 | Running      | p1_b2         | Replay Delete
v_vmart_node0002 | Running      | p1            | Mergeout
v_vmart_node0003 | Running      | p1_b2         | Replay Delete
v_vmart_node0001 | Running      | p1            | Mergeout

UDFS_EVENTS

Records information about events involving the [S3](#), [HDFS](#), [GCS](#), and [Azure](#) file systems.

Events are logged if they take longer to complete than the threshold specified by [UDFSslowRequestThreshold](#) (default 1000ms).

HTTP requests are logged if they take longer to complete than the threshold specified by [HTTPslowRequestThreshold](#) (default 500ms), or if they produce errors or are retries. HTTP requests are logged only for S3.

Column Name	Data Type	Description
START_TIME	TIMESTAMPTZ	Event start time
END_TIME	TIMESTAMPTZ	Event end time
NODE_NAME	VARCHAR	Name of the node that reported the event
SESSION_ID	VARCHAR	Identifies the event session, unique within the cluster at any point in time but can be reused when the session closes.
USER_ID	INTEGER	Identifies the event user.
TRANSACTION_ID*	INTEGER	Identifies the event transaction within the SESSION_ID-specified session, if any; otherwise NULL.
STATEMENT_ID*	INTEGER	Uniquely identifies the current statement, if any; otherwise NULL.
REQUEST_ID*	INTEGER	Uniquely identifies the event request in the user session.
FILESYSTEM	VARCHAR	Name of the file system, such as S3

PATH	VARCHAR	Complete file path
EVENT	VARCHAR	An event type, such as <code>HttpRequestAttempt</code> , or a function call, such as <code>virtual size_t SAL::S3FileOperator::read(void*, size_t)</code>
STATUS	VARCHAR	Status of the event: OK, CANCEL, or FAIL
DESCRIPTION	VARCHAR	Other event details. Depending on the event type, this column can be plain text or JSON.
ACTIVITY	VARCHAR	Points to the component that was active and logged the event, for internal use only.
PLAN_ID	VARCHAR	Uniquely identifies the node-specific Optimizer plan for this event.
OPERATOR_ID	INTEGER	Identifier assigned by the Execution Engine operator instance that performs the work

* In combination, TRANSACTION_ID, STATEMENT_ID, and REQUEST_ID uniquely identify an event within a given session.

Privileges

Superuser

UDFS_OPS_PER_HOUR

This table summarizes the S3 file system statistics for each hour.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node the file system is on.
FILESYSTEM	VARCHAR	Name of the file system, such as S3.
START_TIME	TIMESTAMP	Start time for statistics gathering.
END_TIME	TIMESTAMP	Stop time for statistics gathering.
AVG_OPERATIONS_PER_SECOND	INTEGER	Average number of operations per second during the specified hour.
AVG_ERRORS_PER_SECOND	INTEGER	Average number of errors per second during the specified hour.
RETRIES	INTEGER	Number of retry events during the specified hour.
METADATA_READS	INTEGER	Number of requests to write metadata during the specified hour. For example, S3 POST and DELETE requests are metadata writes.
METADATA_WRITES	INTEGER	Number of requests to write metadata during the specified hour. For example, S3 POST and DELETE requests are metadata writes.
DATA_READS	INTEGER	Number of read operations, such as S3 GET requests to download files, during the specified hour.
DATA_WRITES	INTEGER	Number of write operations, such as S3 PUT requests to upload files, during the specified hour.
UPSTREAM_BYTES	INTEGER	Number of bytes received during the specified hour.
DOWNSTREAM_BYTES	INTEGER	Number of bytes sent during the specified hour.

Examples

```

=> \x
Expanded display is on.
=> SELECT * FROM UDFS_OPS_PER_HOUR;
-[ RECORD 1 ]-----+-----
node_name          | e1
filesystem         | S3

[UDFS_OPS_PER_MINUTE](#)

UDFS_OPS_PER_MINUTE

This table summarizes the S3 file system statistics for each minute.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node the file system is on.
FILESYSTEM	VARCHAR	Name of the file system, such as S3.
START_TIME	TIMESTAMP	Start time for statistics gathering.
END_TIME	TIMESTAMP	Stop time for statistics gathering.
AVG_OPERATIONS_PER_SECOND	INTEGER	Average number of operations per second during the specified minute.
AVG_ERRORS_PER_SECOND	INTEGER	Average number of errors per second during the specified minute.
RETRIES	INTEGER	Number of retry events during the specified minute.
METADATA_READS	INTEGER	Number of requests to write metadata during the specified minute. For example, S3 POST and DELETE requests are metadata writes.
METADATA_WRITES	INTEGER	Number of requests to write metadata during the specified minute. For example, S3 POST and DELETE requests are metadata writes.
DATA_READS	INTEGER	Number of read operations, such as S3 GET requests to download files, during the specified minute.
DATA_WRITES	INTEGER	Number of write operations, such as S3 PUT requests to upload files, during the specified minute.
UPSTREAM_BYTES	INTEGER	Number of bytes received during the specified minute.
DOWNSTREAM_BYTES	INTEGER	Number of bytes sent during the specified minute.

Examples

```

=> \x
Expanded display is on.
=> SELECT * FROM UDFS_OPS_PER_MINUTE;
-[ RECORD 1 ]-----+-----
node_name      | e1
filesystem     | S3
start_time     | 2018-04-06 04:17:00
end_time       | 2018-04-06 04:18:00
avg_operations_per_second | 0
avg_errors_per_second   | 0
retries        | 0
metadata_reads  | 0
metadata_writes | 0
data_reads     | 0
data_writes    | 0
upstream_bytes | 0
downstream_bytes | 0
...

```

See also

[UDFS_OPS_PER_HOUR](#)

UDFS_STATISTICS

Records aggregate information about operations on file systems and object stores. For access through LibHDFS++, the table records information about metadata but not data.

An operation can be made up of many individual read, write, or retry requests. SUCCESSFUL_OPERATIONS and FAILED_OPERATIONS count operations; the other counters count individual requests. When an operation finishes, one of the OPERATIONS counters is incremented once, but several other counters could be incremented several times each.

Column Name	Data Type	Description
FILESYSTEM	VARCHAR	Name of the file system, such as S3 or Libhdfs++.
SUCCESSFUL_OPERATIONS	INTEGER	Number of successful operations.
FAILED_OPERATIONS	INTEGER	Number of failed operations.
RETRIES	INTEGER	Number of retry events.
METADATA_READS	INTEGER	Number of requests to read metadata. For example, S3 list bucket and HEAD requests are metadata reads.
METADATA_WRITES	INTEGER	Number of requests to write metadata. For example, S3 POST and DELETE requests are metadata writes.
DATA_READS	INTEGER	Number of read operations, such as S3 GET requests to download files.
DATA_WRITES	INTEGER	Number of write operations, such as S3 PUT requests to upload files.
DOWNSTREAM_BYTES	INTEGER	Number of bytes received.
UPSTREAM_BYTES	INTEGER	Number of bytes sent.
OPEN_FILES	INTEGER	Number of files that are currently open.
MAPPED_FILES	INTEGER	Number of files that are currently mapped. On S3 file systems, this is the number of streaming connections for reading data. On other file systems, this value is 0.
READING	INTEGER	The number of read operations that are currently running.

WRITING	INTEGER	The number of write operations that are currently running.
TOTAL_REQUEST_DURATION_MS	INTEGER	Accumulated HTTP request duration, in milliseconds. This information is recorded only for S3 and GCS.
OVERALL_AVERAGE_LATENCY_MS	INTEGER	Average HTTP request duration, in milliseconds. This value is TOTAL_REQUEST_DURATION_MS divided by the sum of SUCCESSFUL_OPERATIONS and FAILED_OPERATIONS (rounded). This value is set only for S3 and GCS.
OVERALL_DOWNSTREAM_THROUGHPUT_MB_S	FLOAT	HTTP request downstream throughput in megabytes per second (MB/s). This value is DOWNSTREAM_BYTES divided by TOTAL_REQUEST_DURATION_MS. This value is set only for S3 and GCS.
OVERALL_UPSTREAM_THROUGHPUT_MB_S	FLOAT	HTTP request upstream throughput in megabytes per second (MB/s). This value is UPSTREAM_BYTES divided by TOTAL_REQUEST_DURATION_MS. This value is set only for S3 and GCS.

Examples

The following query gets the total number of metadata RPCs for Libhdfs++ operations:

```
-> SELECT SUM(metadata_reads) FROM UDFS_STATISTICS WHERE filesystem = 'Libhdfs++';
```

UDX_EVENTS

Records information about events raised from the execution of user-defined extensions.

A UDX populates the `__RAW__` column using `ServerInterface::logEvent()` (C++ only). VMap support is provided by Flex Tables, which must not be disabled.

In combination, TRANSACTION_ID, STATEMENT_ID, and REQUEST_ID uniquely identify an event within a given session.

Column Name	Data Type	Description
REPORT_TIME	TIMESTAMPTZ	Time the event occurred.
NODE_NAME	VARCHAR	Name of the node that reported the event
SESSION_ID	VARCHAR	Identifies the event session, unique within the cluster at any point in time but can be reused when the session closes.
USER_ID	INTEGER	Identifies the user running the UDX.
USER_NAME	VARCHAR	Identifies the user running the UDX.
TRANSACTION_ID	INTEGER	Identifies the event transaction within the SESSION_ID-specified session, if any; otherwise NULL.
STATEMENT_ID	INTEGER	Uniquely identifies the current statement, if any; otherwise NULL.
REQUEST_ID	INTEGER	Uniquely identifies the event request in the user session.
UDX_NAME	VARCHAR	Name of the UDX, as specified in the corresponding CREATE FUNCTION statement.
__RAW__	VARBINARY	VMap containing UDX-specific values. See the documentation of individual UDXs for supported fields.

UDX_FENCED_PROCESSES

Provides information about processes Vertica uses to run user-defined extensions in fenced mode.

Column Name	Data Type	Description
-------------	-----------	-------------

NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
PROCESS_TYPE	VARCHAR	Indicates what kind of side process this row is for and can be one of the following values: <ul style="list-style-type: none"> UDxZygoteProcess — Master process that creates worker side processes, as needed, for queries. There will be, at most, 1 UP UDxZygoteProcess for each Vertica instance. UDxSideProcess — Indicates that the process is a worker side process. There could be many UDxSideProcesses, depending on how many sessions there are, how many queries, and so on.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
LANGUAGE	VARCHAR	The language of the UDx. For example 'R' or 'C++';
MAX_MEMORY_JAVA_KB	INTEGER	The maximum amount of memory in KB that can be used for the Java heap file on the node.
PID	INTEGER	Linux process identifier of the side process (UDxSideProcess).
PORT	VARCHAR	For Vertica internal use. The TCP port that the side process is listening on.
STATUS	VARCHAR	Set to UP or DOWN, depending on whether the process is alive or not. After a process fails, Vertica restarts it only on demand. So after a process failure, there might be periods of time when no side processes run.

Privileges

None

USER_LIBRARIES

Lists the user libraries that are currently loaded. These libraries contain user-defined extensions (UDxs) that provide additional analytic functions.

Column Name	Data Type	Description
NAMESPACE_NAME	VARCHAR	For Eon Mode databases, name of the namespace that contains the library.
SCHEMA_NAME	VARCHAR(8192)	The name of the schema containing the library. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
LIB_NAME	VARCHAR(8192)	The name of the library.
LIB_OID	INTEGER	The object ID of the library.
AUTHOR	VARCHAR(8192)	The creator of the library file.
OWNER_ID	INTEGER	The object ID of the library's owner.
LIB_FILE_NAME	VARCHAR(8192)	The name of the shared library file.

MD5_SUM	VARCHAR(8192)	The MD5 checksum of the library file, used to verify that the file was correctly copied to each node. Note This use of MD5 is not for cryptographic or authentication purposes. For information on authenticating with MD5 see Hash authentication .
SDK_VERSION	VARCHAR(8192)	The version of the Vertica SDK used to compile the library.
REVISION	VARCHAR(8192)	The revision of the Vertica SDK used to compile the library.
LIB_BUILD_TAG	VARCHAR(8192)	Internal information set by library developer to track the when the library was compiled.
LIB_VERSION	VARCHAR(8192)	The version of the library.
LIB_SDK_VERSION	VARCHAR(8192)	The version of the Vertica SDK intended for use with the library. The developer sets this value manually. This value may differ from the values in the SDK_VERSION and REVISION, which are set automatically during compilation.
SOURCE_URL	VARCHAR(8192)	A URL that contains information about the library.
DESCRIPTION	VARCHAR(8192)	A description of the library.
LICENSES_REQUIRED	VARCHAR(8192)	The licenses required to use the library.
SIGNATURE	VARCHAR(8192)	The signature used to sign the library for validation.
DEPENDENCIES	VARCHAR (8192)	External libraries on which this library depends. These libraries are maintained by Vertica, just like the user libraries themselves.

USER_LIBRARY_MANIFEST

Lists user-defined functions contained in all loaded user libraries.

Column Name	Data Type	Description
NAMESPACE_NAME	VARCHAR	For Eon Mode databases, name of the namespace that contains the function.
SCHEMA_NAME	VARCHAR	Name of the schema that contains the function. If the schema belongs to a non-default namespace in an Eon Mode database, the schema name is front-qualified with the name of the schema's namespace. For example, n1.s refers to schema s in namespace n1 .
LIB_NAME	VARCHAR	The name of the library containing the UDF.
LIB_OID	INTEGER	The object ID of the library containing the function.
OBJ_NAME	VARCHAR	The name of the constructor class in the library for a function.
OBJ_TYPE	VARCHAR	The type of user defined function (scalar function, transform function)
ARG_TYPES	VARCHAR	A comma-delimited list of data types of the function's parameters.
RETURN_TYPE	VARCHAR	A comma-delimited list of data types of the function's return values.

Privileges

None

USER_SESSIONS

Returns user session history on the system.

Column Name	Data Type	Description
NODE_NAME	VARCHAR	Name of the node that is reporting the requested information.
USER_NAME	VARCHAR	Name of the user at the time Vertica recorded the session.
SESSION_ID	VARCHAR	Identifier for this session. This identifier is unique within the cluster at any point in time but can be reused when the session closes.
TRANSACTION_ID	VARCHAR	Identifier for the transaction within the session, if any. If a session is active but no transaction has begun, TRANSACTION_ID returns NULL.
STATEMENT_ID	VARCHAR	Unique numeric ID for the currently-running statement. NULL indicates that no statement is currently being processed. The combination of TRANSACTION_ID and STATEMENT_ID uniquely identifies a statement within a session.
RUNTIME_PRIORITY	VARCHAR	Determines the amount of run-time resources (CPU, I/O bandwidth) the Resource Manager should dedicate to queries already running in the resource pool. Valid values are: <ul style="list-style-type: none"> HIGH MEDIUM LOW Queries with a HIGH run-time priority are given more CPU and I/O resources than those with a MEDIUM or LOW run-time priority.
SESSION_START_TIMESTAMP	TIMESTAMPTZ	Value of session at beginning of history interval.
SESSION_END_TIMESTAMP	TIMESTAMPTZ	Value of session at end of history interval.
IS_ACTIVE	BOOLEAN	Denotes if the operation is executing.
CLIENT_OS_HOSTNAME	VARCHAR	The hostname of the client as reported by their operating system.
CLIENT_HOSTNAME	VARCHAR	The IP address and port of the TCP socket from which the client connection was made; NULL if the session is internal. Vertica accepts either IPv4 or IPv6 connections from a client machine. If the client machine contains mappings for both IPv4 and IPv6, the server randomly chooses one IP address family to make a connection. This can cause the CLIENT_HOSTNAME column to display either IPv4 or IPv6 values, based on which address family the server chooses.
CLIENT_PID	INTEGER	Linux process identifier of the client process that issued this connection. Note: The client process could be on a different machine from the server.
CLIENT_LABEL	VARCHAR	User-specified label for the client connection that can be set when using ODBC. See Label in DSN Parameters.

SSL_STATE	VARCHAR	<p>Indicates if Vertica used Secure Socket Layer (SSL) for a particular session. Possible values are:</p> <ul style="list-style-type: none"> • None – Vertica did not use SSL. • Server – Server authentication was used, so the client could authenticate the server. • Mutual – Both the server and the client authenticated one another through mutual authentication. <p>See Implementing Security and TLS protocol.</p>
AUTHENTICATION_METHOD	VARCHAR	<p>Type of client authentication used for a particular session, if known. Possible values are:</p> <ul style="list-style-type: none"> • Unknown • Trust • Reject • Kerberos • Password • MD5 • LDAP • Kerberos-GSS • Ident <p>See Security and authentication and Configuring client authentication.</p>
CLIENT_TYPE	VARCHAR	<p>The type of client from which the connection was made. Possible client type values:</p> <ul style="list-style-type: none"> • ADO.NET Driver • ODBC Driver • JDBC Driver • vsql
CLIENT_VERSION	VARCHAR	Returns the client version.
CLIENT_OS	VARCHAR	Returns the client operating system.
CLIENT_OS_USER_NAME	VARCHAR	The name of the user that logged into, or attempted to log into, the database. This is logged even when the login attempt is unsuccessful.

Privileges

Non-superuser: No explicit privileges required. You only see records for tables that you have privileges to view.

API reference

The Vertica SDK has application programming interfaces (APIs) in the following languages:

- [C++ SDK documentation](#)
- [Java SDK documentation](#)
- [Python SDK documentation](#)
- [R SDK](#)

Vertica has the following client API:

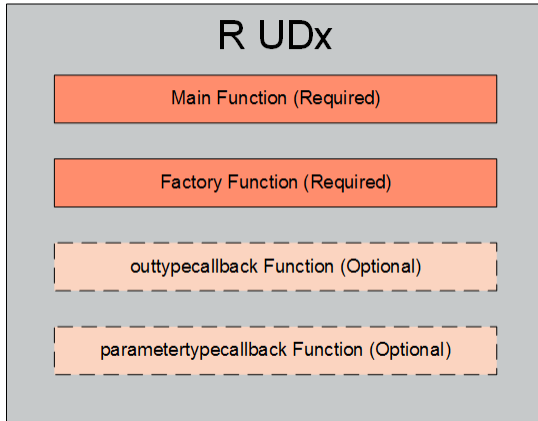

- [JDBC API](#)

In this section

- [C++ SDK](#)
- [Java SDK](#)
- [R SDK](#)
- [Python SDK](#)
- [JDBC API](#)

R SDK

Welcome to the Vertica R SDK API Documentation. This documentation covers all of the functions that make up the R SDK. Using this API, you can create User Defined Extensions (UDxs) that integrate your own features into the Vertica Analytics Platform.

To learn how UDxs work and how to develop, compile, and deploy them, see [Developing user-defined extensions \(UDxs\)](#).

In this section

- [Main function](#)
- [Factory function](#)
- [Outtypecallback function](#)
- [Parametertypecallback function](#)

Main function

The first function called when Vertica runs an R user-defined extension (UDx). It must return a data frame and is defined by the `name` parameter of the factory function.

Example

```
functionName <- function(input_data_frame, parameters_data_frame) {
  # Each column from Vertica is turned into a column in the input data frame.
  # This is a brief example of multiplying two columns of the input data frame.
  output_data_frame <- data.frame(input_data_frame[, 1] * input_data_frame[, 2])
  # The function must return a data frame.
  return(output_data_frame)
}
```

Arguments

<code>input_data_frame</code>	The data read by the Vertica user-defined extension (UDx). This input must be a data frame.
<code>parameters_data_frame</code>	The parameters passed to the Vertica user-defined extension (UDx). This input must be a data frame. If you are passing parameters from your Vertica UDx, defined with <code>USING PARAMETERS</code> , then you must include this in your R UDx. If you are not passing parameters to your R UDx, then this can be omitted from your R UDx.

Description

The main function takes as input one data frame as the first argument, and if your UDx accepts parameters, a parameter data frame as the second argument. The main function must return a data frame. The factory function converts the `intype` argument into a data frame for the main function. For example, `intype=c("float","float")` is converted by the factory function into a two-dimensional matrix.

The function can call other functions defined in your R UDX library file.

Factory function

The factory function consists of an R list which specifies the parameters of your R user-defined extension (UDx).

Example

```
FunctionNameFactory <- function() {  
  list(name          = MainFunctionName,  
       udxtype      = c("scalar"),  
       intype       = c("float", "int", ...),  
       outtype      = c("float", ...),  
       outtypecallback = MyReturnTypeFunc,  
       parametertypecallback = MyParamReturnFunc,  
       volatility    = c("volatile"),  
       strictness    = c("called_on_null_input") )  
}
```

Arguments

name	The name of the R function in this UDx that is called when the function is invoked by Vertica, and which returns the value(s) back to Vertica.
udxtype	The type of UDx, one of the following: <ul style="list-style-type: none">• scalar• transform
intype	Data types of arguments accepted by the function. UDxs support up to 9800 arguments.
outtype	Data types of the arguments returned by the function.
outtypecallback	(Optional) The callback function to call before sending the data back to Vertica, which defines the types and precision that the main function returns.
parametertypecallback	The callback function to send parameter types and names to Vertica. This parameter is required if your UDx is called from Vertica with USING PARAMETERS.
volatility	(Optional) Indicates whether the function returns the same output given the same input, one of the following: <ul style="list-style-type: none">• VOLATILE (default)• IMMUTABLE• STABLE For details, see Setting null input and volatility behavior for R functions.
strictness	(Optional) Indicates whether the function always returns NULL when any input argument is NULL, one of the following: <ul style="list-style-type: none">• CALLED_ON_NULL_INPUT (default)• RETURN_NULL_ON_NULL_INPUT• STRICT For details, see Setting null input and volatility behavior for R functions.

Description

User-defined functions in R (R UDx) require a factory function for each main R function that you want to call from within Vertica. The factory function encapsulates all the information required by Vertica to load the R UDx.

Outtypecallback function

Function to define the column names, output data types, length/precision, and scale of the data being returned to Vertica.

Example

```
SalesTaxReturnTypes <- function(arguments.data.frame, parameters.data.frame) {  
  output.return.type <- data.frame(datatype = rep(NA, 2),  
    length = rep(NA, 2),  
    scale = rep(NA, 2),  
    name = rep(NA, 2))  
  output.return.type$datatype <- c("float", "float")  
  output.return.type$name <- c("Sales Tax Rate", "Item Cost with Tax")  
  return(output.return.type)  
}
```

Arguments

* arguments.data.frame	Data frame that contains the arguments passed to the UDX from Vertica. This data frame is created and used internally by the UDX process.
* parameters.data.frame	Data frame that contains the parameters defined in the UDX from Vertica. This data frame is created and used internally by the UDX process.
datatype	Output data type.
length	(Optional) Dimension of the output.
scale	(Optional) Proportional dimensions of the output.
name	Column name of the output.

Description

When creating the **outtypecallback** function, define one row for each value returned. Use the same order as in the **outtype** defined in the factory function. If any columns are left blank or the **outtypecallback** function is omitted, then Vertica uses default values.

Important

When specifying LONG VARCHAR or LONG VARBINARY data types, include the space between the two words. For example:

```
datatype = c("long varchar")
```

Parametertypecallback function

Function to define the output data type(s), length/precision, and scale of the parameters sent to the main function.

Example

```
FunctionNameParameterTypes <- function() {  
  parameters <- list(datatype = c("int", "varchar"),  
    length = c("NA", "100"),  
    scale = c("NA", "NA"),  
    name = c("k", "algorithm"))  
  return(parameters)  
}
```

Arguments

datatype	The data type of the parameter.
length	(Optional) The dimension of the parameter.
scale	The proportional dimensions of the parameter.

name	The name of the parameter.
-------------	----------------------------

Description

When creating the `parametertypecallback` function, you define one row for each parameter being sent to the function. You must specify a `parametertypecallback` function if your UDx uses parameters.

The `parametertypecallback` does not accept any input arguments.

Vertica error messages

Welcome to the Vertica Error Codes guide. This guide is mainly for developers who need to understand how Vertica's error codes relate to error states returned by the ODBC and JDBC drivers.

The different ways Vertica reports errors

Vertica reports warnings and errors via two different mechanisms: SQLSTATEs and error messages. SQLSTATEs are intended for use by client applications, such as those accessing Vertica via ODBC or JDBC. Error messages are displayed to interactive users (for example, users connected to Vertica through [vsqL](#)) and written to error logs.

About SQLSTATE

Vertica reports the success or failure of each statement it executes to client applications using a five-character SQLSTATE value. Many of these values are defined by the SQL standard. Others (identified by the letter "V" in their values) are Vertica-specific.

SQLSTATE values are grouped into classes which are defined by the first two characters in the SQLSTATE value. The last three characters indicate a specific condition within a class. For example, the SQLSTATE class 22 represents all data errors. The specific SQLSTATE value 22012 represents a division by zero error. SQLSTATE classes let an application that does not recognize a specific SQLSTATE value to still get a general idea of the result.

Warning and error messages

Each error and warning message displayed to interactive users or written to a log file by Vertica has its own numeric error code assigned to it. For example:

ERROR 3117: Division by zero
WARNING 4098: No projections found
ERROR 5617: Multiple WITH clauses not allowed

The error code number is not related to the SQLSTATE value. However, error and warning messages do correspond to a specific SQLSTATE. They are just a more-specific human-readable message compared to the SQLSTATE, which is mainly intended for client applications.

For example, all warning messages displayed by Vertica correspond to the SQLSTATE class 01. The warning message "**WARNING 3084: Design Workspace couldn't be dropped**" corresponds to the SQLSTATE value 01000 ERRCODE_WARNING.

Error codes do not change between Vertica releases, but individual error and warning messages may be added or removed in new releases. Your client application should not depend on particular error code appearing from one release to the next. Instead, it should use the SQLSTATE value to determine the result of executing a statement.

See the [SQL state list](#) for a list of all the SQLSTATE classes and values defined by Vertica. This table also links to lists of error or warning messages that are associated with each SQLSTATE value.

In this section

- [SQL state list](#)

SQL state list

The following table lists the SQLSTATE classes and individual SQLSTATE codes.

SQLState	Description	Details
Class 00—Successful Completion		
00000	SUCCESSFUL_COMPLETION	associated error messages

Class 01—Warning		
01000	WARNING	associated warning messages
01003	WARNING_NULL_VALUE_ELIMINATED_IN_SET_FUNCTION	
01004	WARNING_STRING_DATA_RIGHT_TRUNCATION	associated warning messages
01006	WARNING_PRIVILEGE_NOT_REVOKED	associated warning messages
01007	WARNING_PRIVILEGE_NOT_GRANTED	associated warning messages
01008	WARNING_PRIVILEGE_ALREADY_GRANTED	
01009	WARNING_PRIVILEGE_ALREADY_REVOKED	associated warning messages
0100C	WARNING_DYNAMIC_RESULT_SETS_RETURNED	
01V01	WARNING_DEPRECATED_FEATURE	associated warning messages
01V02	WARNING_QUERY_RETRIED	
Class 02—No Data		
02000	NO_DATA	associated error messages
02001	NO_ADDITIONAL_DYNAMIC_RESULT_SETS_RETURNED	
Class 03—SQL Statement Not Yet Complete		
03000	SQL_STATEMENT_NOT_YET_COMPLETE	
Class 08—Client Connection Exception		
08000	CONNECTION_EXCEPTION	associated error messages
08001	SQLCLIENT_UNABLE_TO_ESTABLISH_SQLCONNECTION	associated error messages
08003	CONNECTION_DOES_NOT_EXIST	associated error messages
08004	SQLSERVER_REJECTED_ESTABLISHMENT_OF_SQLCONNECTION	associated error messages
08006	CONNECTION_FAILURE	associated error messages
08007	TRANSACTION_RESOLUTION_UNKNOWN	
08V01	PROTOCOL_VIOLATION	associated error messages
Class 09—Triggered Action Exception		
09000	TRIGGERED_ACTION_EXCEPTION	associated error messages
Class 0A—Feature Not Supported		
0A000	FEATURE_NOT_SUPPORTED	associated error messages
0A005	PLAN_TO_SQL_NOT_SUPPORTED	associated error messages
Class 0B—Invalid Transaction Initiation		

0B000	INVALID_TRANSACTION_INITIATION	associated error messages
Class 0F—Locator Exception		
0F000	LOCATOR_EXCEPTION	
0F001	L_E_INVALID_SPECIFICATION	
Class 0L—Invalid Grantor		
0L000	INVALID_GRANTOR	
0LV01	INVALID_GRANT_OPERATION	associated error messages
Class 0P—Invalid Role Specification		
0P000	INVALID_ROLE_SPECIFICATION	
Class 20—Case Not Found		
20000	CASE_NOT_FOUND	associated error messages
Class 21—Cardinality Violation		
21000	CARDINALITY_VIOLATION	associated error messages
Class 22—Data Exception		
22000	DATA_EXCEPTION	associated error messages
22001	STRING_DATA_RIGHT_TRUNCATION	associated error messages
22002	NULL_VALUE_NO_INDICATOR_PARAMETER	
22003	NUMERIC_VALUE_OUT_OF_RANGE	associated error messages
22004	NULL_VALUE_NOT_ALLOWED	associated error messages
22005	ERROR_IN_ASSIGNMENT	
22007	INVALID_DATETIME_FORMAT	associated error messages
22008	DATETIME_FIELD_OVERFLOW	associated error messages
22009	INVALID_TIME_ZONE_DISPLACEMENT_VALUE	associated error messages
2200B	ESCAPE_CHARACTER_CONFLICT	associated error messages
2200C	INVALID_USE_OF_ESCAPE_CHARACTER	
2200D	INVALID_ESCAPE_OCTET	associated error messages
2200F	ZERO_LENGTH_CHARACTER_STRING	
2200G	MOST_SPECIFIC_TYPE_MISMATCH	
22010	INVALID_INDICATOR_PARAMETER_VALUE	
22011	SUBSTRING_ERROR	associated error messages

22012	DIVISION_BY_ZERO	associated error messages
22015	INTERVAL_FIELD_OVERFLOW	associated error messages
22018	INVALID_CHARACTER_VALUE_FOR_CAST	
22019	INVALID_ESCAPE_CHARACTER	associated error messages
2201B	INVALID_REGULAR_EXPRESSION	associated error messages
2201E	INVALID_ARGUMENT_FOR_LOG	
2201F	INVALID_ARGUMENT_FOR_POWER_FUNCTION	
2201G	INVALID_ARGUMENT_FOR_WIDTH_BUCKET_FUNCTION	associated error messages
22020	INVALID_LIMIT_VALUE	
22021	CHARACTER_NOT_IN_REPERTOIRE	associated error messages
22022	INDICATOR_OVERFLOW	
22023	INVALID_PARAMETER_VALUE	associated error messages
22024	UNTERMINATED_C_STRING	
22025	INVALID_ESCAPE_SEQUENCE	associated error messages
22026	STRING_DATA_LENGTH_MISMATCH	
22027	TRIM_ERROR	
2202E	ARRAY_ELEMENT_ERROR	
22906	NONSTANDARD_USE_OF_ESCAPE_CHARACTER	associated error messages
22V01	FLOATING_POINT_EXCEPTION	
22V02	INVALID_TEXT_REPRESENTATION	associated error messages
22V03	INVALID_BINARY_REPRESENTATION	associated error messages
22V04	BAD_COPY_FILE_FORMAT	associated error messages
22V05	UNTRANSLATABLE_CHARACTER	
22V0B	ESCAPE_CHARACTER_ON_NOESCAPE	associated error messages
22V21	INVALID_EPOCH	associated error messages
22V23	RAISE_EXCEPTION	associated error messages
22V24	COPY_PARSE_ERROR	associated error messages
Class 23—Integrity Constraint Violation		
23000	INTEGRITY_CONSTRAINT_VIOLATION	
23001	RESTRICT_VIOLATION	

23502	NOT_NULL_VIOLATION	associated error messages
23503	FOREIGN_KEY_VIOLATION	associated error messages
23505	UNIQUE_VIOLATION	associated error messages
23514	CHECK_VIOLATION	associated error messages
Class 24—Invalid Cursor State		
24000	INVALID_CURSOR_STATE	
Class 25—Invalid Transaction State		
25000	INVALID_TRANSACTION_STATE	associated error messages
25001	ACTIVE_SQL_TRANSACTION	
25002	BRANCH_TRANSACTION_ALREADY_ACTIVE	
25003	INAPPROPRIATE_ACCESS_MODE_FOR_BRANCH_TRANSACTION	
25004	INAPPROPRIATE_ISOLATION_LEVEL_FOR_BRANCH_TRANSACTION	
25005	NO_ACTIVE_SQL_TRANSACTION_FOR_BRANCH_TRANSACTION	
25006	READ_ONLY_SQL_TRANSACTION	associated error messages
25007	SCHEMA_AND_DATA_STATEMENT_MIXING_NOT_SUPPORTED	
25008	HELD_CURSOR_REQUIRES_SAME_ISOLATION_LEVEL	
25V01	NO_ACTIVE_SQL_TRANSACTION	associated error messages
25V02	IN_FAILED_SQL_TRANSACTION	
Class 26—Invalid SQL Statement Name		
26000	INVALID_SQL_STATEMENT_NAME	
Class 27—Triggered Data Change Violation		
27000	TRIGGERED_DATA_CHANGE_VIOLATION	
Class 28—Invalid Authorization Specification		
28000	INVALID_AUTHORIZATION_SPECIFICATION	associated error messages
28001	ACCOUNT_LOCKED	associated error messages
28002	PASSWORD_EXPIRED	
28003	PASSWORD_IN_GRACE_PERIOD	
Class 2B—Dependent Privilege Descriptors Still Exist		
2B000	DEPENDENT_PRIVILEGE_DESCRIPTOR_STILL_EXIST	
2BV01	DEPENDENT_OBJECTS_STILL_EXIST	associated error messages

Class 2D—Invalid Transaction Termination		
2D000	INVALID_TRANSACTION_TERMINATION	
Class 2F—SQL Routine Exception		
2F000	SQL_ROUTINE_EXCEPTION	
2F002	S_R_E_MODIFYING_SQL_DATA_NOT_PERMITTED	
2F003	S_R_E_PROHIBITED_SQL_STATEMENT_ATTEMPTED	
2F004	S_R_E_READING_SQL_DATA_NOT_PERMITTED	
2F005	S_R_E_FUNCTION_EXECUTED_NO_RETURN_STATEMENT	
Class 34—Invalid Cursor Name		
34000	INVALID_CURSOR_NAME	
Class 38—External Routine Exception		
38000	EXTERNAL_ROUTINE_EXCEPTION	
38001	E_R_E_CONTAINING_SQL_NOT_PERMITTED	
38002	E_R_E_MODIFYING_SQL_DATA_NOT_PERMITTED	
38003	E_R_E_PROHIBITED_SQL_STATEMENT_ATTEMPTED	
38004	E_R_E_READING_SQL_DATA_NOT_PERMITTED	associated error messages
Class 39—External Routine Invocation Exception		
39000	EXTERNAL_ROUTINE_INVOCATION_EXCEPTION	
39001	E_R_I_E_INVALID_SQLSTATE_RETURNED	
39004	E_R_I_E_NULL_VALUE_NOT_ALLOWED

SQLSTATE 01000 description

WARNING

Messages associated with this SQLState

Error messages

ERROR 5922: Insufficient privileges to alter table *string*

Notice messages

NOTICE 2005: *string*
NOTICE 2519: Cannot shut down while users are connected
NOTICE 2690: Compression hint specified for column '*string*' does nothing because column is GROUPED
NOTICE 3175: Encoding requested for column '*string*' does nothing
NOTICE 3512: Ignoring data path, change unsupported
NOTICE 4927: The *string string* depends on *string*
NOTICE 4929: The *string [string]* depends on *string*
NOTICE 5748: API limitation: affinities will be set only for the first *value* (out of *value*) CPUs
NOTICE 6008: Resetting CPU affinity set for resource pool *string* to the default (ANY)
NOTICE 6182: Cannot shut down while DBD sessions are running
NOTICE 7090: Cannot set affinity set for resource pool '*string*' because the affinity mode is ANY
NOTICE 7338: The column "*string*" of table "*string*" is referenced by table "*string*", column "*string*"
NOTICE 8689: *value* objects could not be re-parented
NOTICE 9088: Omitting rest of dependent objects, overall *value* objects depending on *string*
NOTICE 9503: The *string [value]* depends on *string*

Warning messages

WARNING 2005: *string*
WARNING 2362: Cannot begin transaction; transaction is already running
WARNING 3084: Design couldn't be dropped
WARNING 3152: Duplicate values in columns marked as UNIQUE will now be ignored for the remainder of your session or until `reenable_duplicate_key_error()` is called
WARNING 3372: Failed to disable profiling: *string*
WARNING 3373: Failed to enable profiling: *string*
WARNING 3539: Incorrect results are possible. Please contact Vertica Support if unsure
WARNING 3791: Invalid view *string: string*
WARNING 4071: NO COMMIT option will be ignored for external table "*string*"
WARNING 4088: No new valid default roles specified. Retaining previous

set of default roles for user *string*

WARNING 4098: No projections found

WARNING 4102: No rows are inserted into table "*string*". "*string*" because ON COMMIT DELETE ROWS is the default for create temporary table

WARNING 4116: No super projections created for table *string*.

WARNING 4246: Only GLOBAL scope is supported for clearing *string* profiles

WARNING 4463: Projection *string* is not up to date

WARNING 4468: Projection *<string>* is not available for query processing.
Execute the select start_refresh() function to copy data into this projection.

The projection must have a sufficient number of buddy projections and all nodes must be up before starting a refresh

WARNING 4539: Received no response from *stringstring*

WARNING 4792: Storage option "*string*" will be ignored for external table "*string*"

WARNING 4871: System view *string* for tuning rule *string* is currently invalid

WARNING 4873: System view for tuning rule *string* does not exist

WARNING 4996: This request may deadlock the system. Please report the details to technical support

WARNING 5068: Total declared length of columns of one of the constraints exceeds the limit, truncation may happen

WARNING 5119: UDx code didn't respond when Vertica tried to get function prototype for *string* in library *string: string*

WARNING 5448: View *string* is currently invalid

WARNING 5451: Violations of some of foreign key constraints may not be reported because of no privilege on the foreign tables

WARNING 5642: Projection *string* is not persistent or not up to date; it will not be copied

WARNING 5717: No statistics has been exported. Either the DB is empty or you try to export an external table or you do not have access to the available objects

WARNING 5724: Segmentation clause contains a *string* - data loads may be slowed significantly

WARNING 5727: Sort clause contains a *string* - data loads may be slowed significantly

WARNING 5741: View *string* depends on other relations

WARNING 5819: Design could not be reset

WARNING 5821: Detected keys sharing the same case-insensitive key name

WARNING 5860: Due to the data isolation of temp tables with an on-commit-delete-rows policy, the compute_flexable_keys() and compute_flexable_keys_and_build_view() functions cannot access this table's data. The build_flexable_view() function can be used with a user-provided keys table to create a view, but involves a DDL commit which will delete the table's rows

WARNING 5873: Failed to add table *string* of hcatalog schema *string* to catalog: *string*

WARNING 5875: Failed to alter table *string* of hcatalog schema *string* to catalog: *string*

WARNING 5880: Failed to describe table *string* in hcatalog database *string: string*

WARNING 5881: Failed to describe table *string* in schema *string: HCatalog* database *string* does not exist

WARNING 5884: Failed to list hcatalog tables of hcatalog schema *string: string*

WARNING 5886: Failed to mirror table *string* in schema *string: string*

WARNING 5909: Found and ignored keys with names longer than the maximum column-name length limit

WARNING 5912: HASH() arguments contain expressions that reference

table columns

WARNING 5917: Ignored some keys since the total key count exceeds the view column limit

WARNING 5922: Insufficient privileges to alter table *string*

WARNING 5923: Insufficient privileges to drop table *string*

WARNING 5991: Projection basename "*string*" hint was ignored. "*string*" is used as the basename

WARNING 5993: Projection is irregularly segmented by column

WARNING 6053: The view creation involved a DDL commit which deleted the table's rows

WARNING 6256: Error while analyzing constraint(s) *string* on *string*

WARNING 6257: Error while creating LTT for analyzing constraints on *string*

WARNING 6356: No partitions have been swapped. Neither table has partitions fall in range

WARNING 6417: Swapped partitions are not immediately moved to a new storage location

WARNING 6515: Projection with name "*string*" already exists in schema "*string*" for anchor table "*string.string*"

WARNING 6565: Inequal query trees produced the same hash code query1:

string

query2:

string

WARNING 6594: Unknown RangeTblEntry: *value*

WARNING 6608: *string* is an invalid argument for hint *string*

WARNING 6765: Error parsing distrib value *string* in Distrib hint's arguments. The whole hint will be ignored

WARNING 6773: Failed to compare plans for query '*string*'

WARNING 6797: Hint *string* can accept at most one argument, the hint with *value* arguments is ignored

WARNING 6798: Hint *string* can be specified only once for each join, if multiple instances listed only the first is considered

WARNING 6799: Hint *string* is not feasible and will be ignored

WARNING 6800: Hint *string* must have one argument

WARNING 6801: Hint *string* requires exactly two arguments, the hint with *value* arguments is ignored

WARNING 6813: Inherited privileges are globally disabled; schema parameter is set but has no effect

WARNING 6814: Inherited privileges are globally disabled; table parameter is set but has no effect

WARNING 6815: Inherited privileges are globally disabled; view parameter is set but has no effect

WARNING 6818: Input operations specified for Hint *string* is not feasible and will be ignored

WARNING 6922: Projection name was changed to *string* because it conflicts with the basename of the table *string*

WARNING 6990: Text index has invalid tokenizer

WARNING 6991: The active saved plan for this query has incompatible output column set. Continuing with the original query

WARNING 7000: The projection '*string*' was used to enforce the enabled key constraint '*string*', and may be regenerated to validate a DML statement on the base table

WARNING 7020: Unable to find the following query in the export file:

'string'

WARNING 7030: Unexpected group clause found during query comparison

WARNING 7031: Unexpected group clause found during query hashing

WARNING 7033: Unexpected sort clause found during query comparison

WARNING 7036: Unknown Expr: *value* during query comparison

WARNING 7037: Unknown Expr: *value* found

WARNING 7037: Unknown Expr:*value* found

WARNING 7038: Unknown Expr:*value* found during query hashing

WARNING 7039: Unknown Inequality OpOid:*value* found during query hashing

WARNING 7040: Unknown Logic OpExpr:*value* found during query comparison

WARNING 7041: Unknown Logic OpExpr:*value* found during query hashing

WARNING 7044: Unknown OpExpr:*value* found during query comparison

WARNING 7045: Unknown OpExpr:*value* found during query hashing

WARNING 7046: Unknown RangeTblEntry:*value* found during query comparison

WARNING 7047: Unknown RangeTblEntry:*value* found during query hashing

WARNING 7048: Unknown Sublink:*value* found during query comparison

WARNING 7049: Unknown Sublink:*value* found during query hashing

WARNING 7052: Unsupported JoinExpr Type found during query comparison

WARNING 7053: Unsupported JoinExpr Type found during query hashing

WARNING 7070: View "*string*" will include privileges from schema "*string*"

WARNING 7074: You appear to be using an old version of HDFS that may have stability problems under high load. See the Vertica documentation for supported HDFS versions

WARNING 7186: Inherited privileges are globally disabled. Privileges will be materialized and visibility of table *string* may change

WARNING 7265: Inherited privileges are globally disabled. Privileges will be materialized and visibility of view *string* may change

WARNING 7709: Could not drop table '*string*'. Please remove manually if necessary.

Detail: *string*

WARNING 7752: Cannot make a local query plan for "try local" hint, please check hash function, segment quantity, segment boundary, etc

WARNING 7793: The cache will be set to 1 instead

WARNING 7942: Unknown expression found during hashing: *value*

WARNING 7994: Not converged before max_iterations [*value*]

WARNING 8012: The parameter [*string*] is not defined for this function

WARNING 8086: Encoding option specified for attribute (*string*) of external table (*string*) will be ignored

WARNING 8275: The following shards missed the *string* due to missing primary subscriber (probably down): *string*

WARNING 8343: Not converged before max_iterations *value*

WARNING 8413: Lambda provided without regularization type: default for regularization is [*string*]; lambda will have no effect

WARNING 8414: max_depth is set to *value* while max_breadth to *value*. This means the size of trees may become limited by *string* first

WARNING 8419: Parameters [*string*] are not supported for optimizer [*string*], only for [*string*]

WARNING 8506: CGD optimizer could not invert covariance matrix which is required for calculating statistics. Coefficients are not affected

WARNING 8526: Regularization type [*string*] may cause optimizer [*string*] to not converge

WARNING 8531: *string* Directory for errors files was not created.

Unable to write errors for this instance of COPY command

WARNING 8547: Not converged before maximum inner iterations *value*

WARNING 8557: Feature *string* not applicable in Eon mode

WARNING 8580: Failed to convert internal form to readable form: *string*

WARNING 8581: Failed to convert to internal form: *string*

WARNING 8582: Failed to describe hcatalog tables of hcatalog schema *string*: *string*

WARNING 8583: Given lambda value [*value*] will result in all zero coefficients; use a value lower than lambda_max for this

coefficients, use a value lower than lambda_max for this dataset [value]

WARNING 8602: Caught exception while parsing JSON

WARNING 8621: The following string provided is not valid JSON: *string*

WARNING 8704: This table is not partitioned. Ignore activePartitionCount changes

WARNING 8737: The meta function set_recover_by_table is disabled in 9.1SP1. set_recover_test_settings() is supposed to be used only for testing purpose by developers

WARNING 8818: Library and dependencies have a combined size of *value* GB,

WARNING 8841: Consider enabling MergeOutCache when reflexive mergeout is disabled. Otherwise background TM Mergeout service may affect the query performance

WARNING 8953: Hint ECSMode is not feasible and will be ignored

WARNING 9002: Setting the token timeout greater than *value* msec may severely decrease cluster responsiveness to node shutdowns and failures

WARNING 9011: MergeOutCache doesn't work when reflexive mergeout is enabled

WARNING 9127: UPDATE/DELETE a table with aggregate projections (LAPs) will automatically run refresh on the LAPs when this transaction commits

WARNING 9210: Target node *string* is down, so depot size has been estimated from depot location on initiator. As soon as the node comes up, its depot size might be altered depending on its disk size

WARNING 9337: Caught exception while connecting to LDAP: *string*

WARNING 9740: Changed max_depth to [value] to avoid a structural limit

WARNING 9974: No DFS file replicas available for retrieval of DFS file located at *string* (Oid: *value*) from its DFS file distribution *value*. This file will be dropped by Recovery

WARNING 9975: No nodes in cluster contain DFSFileBlocks for retrieving DFS file located at *string*: (Oid: *value*). This file will be dropped

WARNING 9990: :c hint in Create directed query CUSTOM has no effect, every constant counts by default

WARNING 9994: IgnoreConst/:v hint in Create directed query OPT has no effect, all constants are ignored by default

WARNING 10003: Unsupported hint for Constant type

WARNING 10251: Failed to disable debugging: *string*

WARNING 10252: Failed to enable debugging: *string*

WARNING 10365: No mergeout ran because mergeout is disabled on table(s) *string*

WARNING 10395: New query label *string* will replace already set label *string*

WARNING 10420: New range-partitioned projection *string* is segmented. Because anchor table *string* has no unsegmented super projections, the new projection cannot be used to process queries

WARNING 10440: Endpoint does not exist (http_code=*value*).Phone home data upload to [*string*] failed: *string*

WARNING 10441: Failed to collect Phone home data

WARNING 10447: Phone home data upload to [*string*] failed: *string*

WARNING 10582: Failed to parse schema [*string*] with error [*string*]

WARNING 10586: Token introspection request to [*string*] failed: *string*

WARNING 10606: Discovery URL request to [*string*] failed: *string*

WARNING 10608: Failed to parse schema of discovery URL response [*string*] with error [*string*]

TRIGGERED_ACTION_EXCEPTION

Messages associated with this SQLState

Error messages

ERROR 2005: *string*

ERROR 7353: A problem during the execution of writeModel.

Detail: *string*

ERROR 7356: A problem occurred during the execution of a BFGS iteration.

Detail: *string*

ERROR 7358: A problem occurred during the execution of a MinMax iteration.

Detail: *string*

ERROR 7359: A problem occurred during the execution of a Newton iteration.

Detail: *string*

ERROR 7360: A problem occurred during the execution of a robust_zscore iteration.

Detail: *string*

ERROR 7361: A problem occurred during the execution of a zscore iteration.

Detail: *string*

ERROR 7362: A problem occurred during the execution of an iteration.

Detail: *string*

ERROR 7373: Cannot check if all columns are numeric.

Detail: *string*

ERROR 7377: Cannot compute input column list.

Detail: *string*

ERROR 7378: Cannot find the current user.

Detail: *string*

ERROR 7383: Cannot make inf clause.

Detail: *string*

ERROR 7384: Cannot make null clause.

Detail: *string*

ERROR 7395: Could not compute evaluation metrics.

Detail: *string*

ERROR 7396: Could not create view '*string*'.

Detail: *string*

ERROR 7497: Problem in balance.

Detail: *string*

ERROR 7498: Problem in balance: Unknown exception

ERROR 7503: Problem in detect outliers

ERROR 7500: Problem in detect_outliers.

Detail: *string*

ERROR 7504: Problem in detect_outliers: Unknown exception

ERROR 7505: Problem in initializing centers table.

Detail: *string*

ERROR 7506: Problem in kmeans.

Detail: *string*

ERROR 7507: Problem in kmeans: Unknown exception

ERROR 7516: Problem in normalize.

Detail: *string*

ERROR 7517: Problem in normalize: Unknown exception

ERROR 7524: Problem in writing initial model to DFS.

Detail: *string*

ERROR 7593: Could not randomly pick *value* distinct centers after trying *value* times

ERROR 7626: A problem during the execution of computing the number of detected outliers.

Detail: *string*

ERROR 7731: Problem in calculating alpha for Linear Regression.

Detail: *string*

ERROR 7732: Problem in calculating Hessian matrix for Linear Regression.

Detail: *string*

ERROR 7733: Problem in strongWolfeLineSearch.

Detail: *string*

ERROR 7734: Problem in zoom.

Detail: *string*

ERROR 7761: A problem during the execution of computing the mad.

Detail: *string*

ERROR 7762: A problem during the execution of computing the median.

Detail: *string*

ERROR 7763: A problem occurred during the execution of a mad computation.

Detail: *string*

ERROR 7764: A problem occurred during the execution of median computation.

Detail: *string*

ERROR 7769: Kmeans++ exceeded max number of retries for choosing initial center

ERROR 7805: No input columns provided

ERROR 7826: Numeric overflow occurred during execution of kmeans++

ERROR 7827: Numeric overflow occurred when computing total sum of squares

ERROR 7828: Numeric overflow occurred when computing total within-cluster sum of squares

ERROR 7829: Numeric overflow occurred when computing within-cluster sum of squares

ERROR 7844: Input table *string* is empty

ERROR 7845: No input columns left after excluding

ERROR 7851: No rows remain after filtering rows with null and infinity values

ERROR 7949: A problem occurred during the execution

of mode computation.

Detail: *string*

ERROR 7961: Problem in impute.

Detail: *string*

ERROR 7962: Problem in impute: Unknown exception

ERROR 7975: A problem occurred during training of SVM model.

Detail: *string*

ERROR 7988: Input table is empty

ERROR 7992: No rows remain after filtering rows containing NULL, NaN or INF

ERROR 8000: Problem in `normalize_fit`.

Detail: *string*

ERROR 8001: Problem in `normalize_fit`: Unknown exception

ERROR 8020: Unexpected empty result from query

ERROR 8045: A blob container cannot be initialized more than once

ERROR 8046: A problem during the execution of computing the max weight.

Detail: *string*

ERROR 8047: A problem during the execution of `sse_linear_reg`

ERROR 8055: A problem occurred during the execution of computing weight table.

Detail: *string*

ERROR 8056: A problem occurred during the execution of saving weight table to vectors.

Detail: *string*

ERROR 8078: Could not link model *string* to catalog object.

Details: *string*

ERROR 8102: Invalid value [*string*] for parameter [*string*]. Valid values are [*string*]

ERROR 8113: Model name cannot be empty

ERROR 8134: Problem in factor function.

Detail: *string*

ERROR 8241: A problem occurred during the execution of

a mode imputation with partition by.

Detail: *string*

ERROR 8242: A problem occurred during the execution of

a mode imputation without partition by.

Detail: *string*

ERROR 8243: A problem occurred during the execution of a mean

imputation with partition by.

Detail: *string*

ERROR 8244: A problem occurred during the execution of a mean imputation.

Detail: *string*

ERROR 8291: A problem occurred during the execution of coordinate descent covariance.

Detail: *string*

ERROR 8293: A problem occurred during the execution of offsets query (averages of all columns).

Detail: *string*

ERROR 8301: Parameter [*string*] cannot be redefined
ERROR 8306: Problem in creating model [*string*].

Detail: *string*

ERROR 8307: Problem in creating model [*string*]: Unknown exception
ERROR 8308: Problem in cross_validation.

Detail: *string*

ERROR 8309: Problem in cross_validation: Unknown exception
ERROR 8315: Type [*string*] of parameter [*string*] is not supported
ERROR 8318: Empty string cannot be passed into extra_levels parameter
ERROR 8319: Invalid JSON for extra_levels: [*string*]
ERROR 8320: Problem in one_hot_encoder_fit.

Detail: *string*

ERROR 8321: Problem in one_hot_encoder_fit: Unknown exception
ERROR 8344: Parameter [*string*] was provided and cannot be included again in cv_hyperparams
ERROR 8369: Could not train any tree. Increase sampling_size
ERROR 8399: A problem in model summary.

Detail: *string*

ERROR 8405: Could not create catalog object for model [*string*]

Detail: *string*

ERROR 8406: Could not create catalog object for temporary model

Detail: *string*

ERROR 8407: Could not link temporary model to catalog object.

Details:*string*

ERROR 8420: Problem in creating temporary model.

Detail: *string*

ERROR 8421: Problem in creating temporary model: Unknown exception
ERROR 8499: A problem occurred during training of a Naive Bayes model.

Detail: *string*

ERROR 8523: One of the folds does not have enough data to train.
Please try to reduce the number of folds
ERROR 8529: Unsupported model format version for upgrade
ERROR 8565: Relation [*string*] has no valid rows
ERROR 8566: Relation [*string*] is empty
ERROR 8572: Error while initializing model upgrade task.

Details:*string*

ERROR 8577: Error while upgrade models.

DETAILS:*string*

ERROR 8590: Schema *value* not found

ERROR 8626: A problem occurred during training of PCA model.

Detail: *string*

ERROR 8627: A problem occurred during training of SVD model.

Detail: *string*

ERROR 8732: Input relation [*string*] is empty

ERROR 9090: Subcluster is already set to default

ERROR 9263: A problem occurred during the execution of a kmeans iteration.

Detail: *string*

ERROR 9267: Could not randomly pick *value* distinct centers after trying *value* times: Number of clusters must not be bigger than the number of distinct rows without null or infinity values

ERROR 9278: Only found less than 2 centers during a bisection. You may want to try again; or there may be fewer than k distinct data points in the table

ERROR 9279: Problem in writing initial kmeans model to DFS.

Detail: *string*

ERROR 9415: Invalid model category: *string*

ERROR 9416: Invalid model type: *string*

ERROR 9450: Failed to import model(s): *string*

ERROR 9477: Unknown exception in importing model(s)

ERROR 9807: The columns [*string*] is empty

ERROR 9808: The total number of categories in all input columns must be less than *value*, but it is *value*

ERROR 9970: Problem in one_hot_encoder_fit.

Detail: *stringstringstring*

ERROR 10127: Could not train any tree, increase sampling_size

ERROR 10300: A problem occurred during the execution of a Moving Average iteration.

Detail: *string*

ERROR 10435: A problem occurred while deleting temp DFS files.

Detail: *string*

Warning messages

WARNING 2005: *string*

WARNING 7784: Could not remove blob named *string*.

Detail: Unexpected exception

WARNING 7785: Could not remove the blob named *string*.

Detail: *string*

WARNING 7858: Only found *value* non-empty clusters. You may want to try again or use a better set of initial centers; or there may be fewer than k distinct datapoints in the table

WARNING 8346: The total number of models to be trained is very large [*value*]. It could take very long time to finish

WARNING 8507: Could not upgrade model to latest version, during import. Please run `upgrade_model()`.

DETAIL:*string*

WARNING 8508: Could not upgrade model to latest version, during import. Please run `upgrade_model()`. Unknown Exception

WARNING 8571: Cannot upgrade an incomplete model: [*value*]. Skipping this model

WARNING 8573: Error while performing upgrade for model: *string*.

ERROR 7790: Order BY is not allowed within the OVER() clause of User
Defined Transforms in projection definitions

ERROR 7792: Resource pool *string* cannot be modified

ERROR 7818: Unsupported type '*string*' for column '*string*'

ERROR 7840: Column [*string*] is duplicated in exclude_columns

ERROR 7841: Column [*string*] is duplicated in predictor_columns

ERROR 7846: Relation *string* is empty

ERROR 7848: Table '*string*' contains *value* rows, should be *value*

ERROR 7878: Too many columns in MLA grouping sets: *value*, while only up
to *value* MLA columns are allowed

ERROR 7889: ALTER MODEL does not support multiple clauses

ERROR 7898: Model *string* cannot be moved under hcatalog schema *string*

ERROR 7900: Model cannot be moved to system schema

ERROR 7926: Catalog object *string* is not either a table or a schema

ERROR 7927: Column "*string*" is referenced in a column set using expression
of projection "*string*" but is not stored in the projection

ERROR 7930: COMPLEX JOIN without a boolean marker column not supported

ERROR 7931: COMPLEX JOIN without a complex_join_marker() column at the
end of the select list not supported

ERROR 7932: COMPLEX JOIN without a subquery not supported

ERROR 7934: Refresh_columns on multiple tables is only supported for
"rebuild" mode

ERROR 7935: Refreshed column cannot be any projection's sort key

ERROR 7937: Refreshed column cannot be referenced in projection's
segmentation expression

ERROR 7938: Refreshed column cannot be referenced in table's partition
expression

ERROR 7964: The selected missing value imputation method is not
supported.

Only support mean and mode based missing value imputation
at present

ERROR 7974: *string* is not supported in fenced UDx

ERROR 7976: Add column with default subquery is not supported for
unsegmented projections

ERROR 7980: Cannot alter model in an incomplete state

ERROR 8008: Refresh_columns with rebuild mode is not supported for
unsegmented projections

ERROR 8010: Table *string* is not supported in fenced UDx

ERROR 8013: The selected normalization method is not supported. Valid options are 'minmax', 'zscore', and 'robust_zscore'

ERROR 8023: Unsupported column type [*string*] for column [*string*]

ERROR 8034: Refresh_columns on enforced PK/Unique constraint columns not supported

ERROR 8038: Cannot alter type of column "*string*" since it is referenced in the SET USING expression of column "*string*"

ERROR 8040: Cannot refresh column containing grouped containers

ERROR 8043: Refreshed column cannot be any projection's grouped column

ERROR 8060: Cannot COPY "*string*" from the client using the keyword LOCAL

ERROR 8123: Not enough number of appropriate samples to run the algorithm (excluding samples with NULL, NaN, or Infinity values)

ERROR 8140: Projections on shared storage cannot use explicit node lists

ERROR 8141: Projections on shared storage cannot use explicit range segmentation

ERROR 8155: SET SCHEMA over flex keys tables is not supported

ERROR 8156: SET SCHEMA over text index tables is not supported

ERROR 8180: UDX concurrency request is not supported for empty OVER clause

ERROR 8202: Cannot run refresh_columns or add column with default subquery when any node is recovering

ERROR 8212: Block Dictionary Compression is not supported for data types longer than *value* bytes

ERROR 8213: Block Dictionary Compression is not supported for data types longer than 65000 bytes

ERROR 8357: Cannot use meta function in partition GROUP BY expression

ERROR 8358: Cannot use non-deterministic function in partition GROUP BY expression

ERROR 8362: PARTITION BY expression must appear at least once in partition GROUP BY expression

ERROR 8363: Partition GROUP BY expression can only reference columns by way of inclusion of the PARTITION BY expression

ERROR 8379: num_clusters must be less than or equal to 10000

ERROR 8386: Cannot use subquery in partition GROUP BY expression

ERROR 8388: PARTITION BY expression may not contain window functions

ERROR 8389: Partition GROUP BY expression cannot return a tuple

ERROR 8390: Partition GROUP BY expression has an unknown type

ERROR 8391: Partition GROUP BY expression may not contain aggregate functions

ERROR 8392: Partition GROUP BY expression may not contain window functions

ERROR 5308: Unterminated hexadecimal string literal at or near "*string*"

ERROR 5310: Unterminated quoted identifier at or near "*string*"

ERROR 5311: Unterminated quoted string at or near "*string*"

ERROR 5323: Usage: clear_profiling(*string* , *string*)

ERROR 5324: Usage: disable_profiling(*string*)

ERROR 5325: Usage: enable_profiling(*string*)

ERROR 5326: Use "*string*(*)" to call this aggregate function

ERROR 5383: User Defined Transform Functions are allowed only in a
SELECT list

ERROR 5386: User defined transform will return *value* columns, whereas *value*
aliases provided

ERROR 5401: User-defined transform function *string* must have an OVER
clause

ERROR 5413: Value must be either "units" or "plain"

ERROR 5415: Value must be either ON or OFF

ERROR 5452: Virtual tables are not allowed in FROM clause of
projection

ERROR 5492: Wrong number of parameters for prepared statement "*string*"

ERROR 5493: Wrong number of parameters on left side of OVERLAPS
expression

ERROR 5494: Wrong number of parameters on right side of OVERLAPS
expression

ERROR 5505: You can specify a node name only once in a create
projection statement, node *string* appears more than once

ERROR 5518: Zero-length delimited identifier at or near "*string*"

ERROR 5566: Dimension tables may not have data that shorter lived than
the fact table

ERROR 5577: Expression for user-defined type column *string* cannot be
coerced

ERROR 5600: Invalid predicate in projection-select. Only PK=FK
equijoins are allowed

ERROR 5617: Multiple WITH clauses not allowed

ERROR 5629: Not a Star or Snow-Flake Query

ERROR 5630: Nullable FKs are not allowed in projection definition

ERROR 5664: Subqueries not allowed in projection definition

ERROR 5670: The number of alias columns must be the same as the number
of selected columns

ERROR 5679: Unrecognized order by expression

ERROR 5691: User-defined function *string* is not a supported scalar
function

ERROR 5711: Invalid function arguments

ERROR 5916: If specified, maximum error percentage must be a numeric
constant

ERROR 5929: Invalid maximum error percentage specified

ERROR 6034: Syntax Error: '*string*' is a built in type

ERROR 6048: The minimum value that may be specified for maximum error
percentage is 0.88

ERROR 6061: Too many arguments to *string*

ERROR 6119: 'deleted' hint takes no arguments

ERROR 6120: 'latestdata' hint arguments must be strings

ERROR 6124: A single argument must be supplied to *string*

ERROR 6136: Aggregate projection without group-by columns is not
supported

ERROR 6137: Aggregate projections must have at least one aggregate
(SUM, COUNT, MIN, or MAX)

ERROR 6140: All sort keys should be in the target list of the
projection

ERROR 6146: At least two columns must be specified

ERROR 6196: Columns in ORDER-BY must be defined in the SELECT
statement

ERROR 6197: Columns/Expressions in GROUP BY/PARTITION BY must be first
and in the same order with columns in SELECT

ERROR 6198: ORDER BY columns/expressions in the OVER() clause must be

the first SELECT columns/expressions not specified by PARTITION BY clause, and must be specified in SELECT list order

ERROR 6199: Columns/Expressions in the PARTITION BY clause may not be repeated in the ORDER BY clause

ERROR 6232: DISTINCT Aggregates are not allowed in projection

ERROR 6293: Interpolated join predicates cannot have expressions or functions over join columns

ERROR 6294: Invalid Argument

ERROR 6321: Limit in Top-K query must be a positive number

ERROR 6324: Limit/Offset is only allowed in topk projections

ERROR 6340: Multiple ORDER BY clauses in partition TopK/Limit query are not allowed

ERROR 6341: Multiple PARTITION clauses in TopK/Limit query are not allowed

ERROR 6367: Only one table or projection is allowed in FROM clause of top-k projection

ERROR 6369: Only SUM, MIN, MAX and COUNT are allowed in aggregate projections

ERROR 6372: ORDER BY is not allowed in aggregate projection. The aggregate projection is automatically ordered on group by columns

ERROR 6373: ORDER BY is not allowed in top-k projections. The top-k projection is automatically ordered on partition by columns

ERROR 6379: PARTITION BEST can only be used with single-phase user defined transform functions

ERROR 6381: PARTITION NODES can only be used with single-phase user defined transform functions

ERROR 6394: SEGMENTED BY / UNSEGMENTED is not allowed in aggregate projection. The aggregate projection is automatically segmented on group by columns

ERROR 6395: SEGMENTED BY / UNSEGMENTED is not allowed in top-k projections. The top-k projection is automatically segmented on partition by columns

ERROR 6539: User Defined Transform *string* returns a string on which collation can't be applied in non default locale

ERROR 6543: Grouping functions only allowed with aggregates

ERROR 6544: MultiLevel Aggregates are not allowed in projection

ERROR 6640: Argument of hint *string* must be a positive integer

ERROR 6654: Batch/Prepass may only be used in the over(...) clause of a user defined transform in a Live Aggregate Projection

ERROR 6686: Cannot specify LIMIT with OVER(...) clause with a user defined transform

ERROR 6696: Column "*string.string*" refers to table "*string*" which is out of scope

ERROR 6697: Columns/Expressions in the partition clause have to appear in the SELECT list

ERROR 6701: Constants with the same parameter hint must be identical

ERROR 6800: Hint *string* must have one argument

ERROR 6853: Live aggregate projections may only be one of the following types: Group-by, Top-K, or UDT

ERROR 6878: No previously saved query to associate with

ERROR 6899: Parameters cannot have NULL values

ERROR 6969: Subqueries for aggregate projections need to contain User Defined Transforms

ERROR 6972: Syntax Error. Struct member '*string*' has missing base type

ERROR 7014: UD Parameters value length [*value*] is more than the max allowed length [*value*]

ERROR 7051: Unsupported hint for input expr

ERROR 7109: Parameter '*string*' is required

ERROR 7147: Option *string* is repeated. Please specify each option only

once

ERROR 7153: Syntax Error. At least one parameter has to be specified

ERROR 7164: Cannot use ORC format with FLEX tables

ERROR 7228: Cannot use *string* compression with *string* files

ERROR 7229: Cannot use PARQUET format with FLEX tables

ERROR 7327: SET USING cannot be specified for IDENTITY/AUTO_INCREMENT column "*string*" of table "*string*"

ERROR 7391: Cannot use an UDSrc with *string* files

ERROR 7420: Expression list has more than one *string* column

ERROR 7488: Number of key/value pairs [*value*] exceeds the maximum allowed

ERROR 7538: Sequence manipulation functions not supported in INSERT SELECT with implicit column that has default query

ERROR 7744: Try local hint only supports SELECT queries without table join

ERROR 7746: Try local hint requires all nodes to be up

ERROR 7755: This projection is not valid with "try_local" hint

ERROR 7875: SET USING/DEFAULT cannot be specified for IDENTITY/AUTO_INCREMENT column "*string*" of table "*string*"

ERROR 7909: Columns/Expressions in PARTITION BY must be first and in the same order with columns in SELECT

ERROR 7965: At most one WHEN MATCHED clause is allowed in MERGE

ERROR 7966: At most one WHEN NOT MATCHED clause is allowed in MERGE

ERROR 7967: MERGE/INSERT has more expressions than target columns

ERROR 7968: MERGE/INSERT has more target columns than expressions

ERROR 7982: Cannot use expressions in OVER(...) clause

ERROR 7989: Invalid column in MERGE statement: *string*. The insert filter of a WHEN NOT MATCHED clause cannot reference the target table *string*

ERROR 8011: SELECT expressions must have column labels

ERROR 8114: Multiple SET USING values specified for column "*string*" of table "*string*"

ERROR 8116: No '=' found in '*string*', while parsing for *string*

ERROR 8164: Subquery in MERGE statement are allowed at SOURCE only

ERROR 8205: Hint *string* cannot be used on NULL

ERROR 8956: If provided synopsis_version must be 2

ERROR 8961: Invalid synopsis_version specified

ERROR 8989: synopsis_version must be a numeric constant

ERROR 9015: Sequence manipulation functions allowed only in outer SELECT list

ERROR 9016: Sequence manipulation functions not allowed in subqueries

ERROR 9040: Cannot add new sort order to an existing projection

ERROR 9060: Mismatch with the existing sort order

ERROR 9062: No changes made to the existing sort order

ERROR 9362: Only a table or projection is allowed in the FROM clause of a top-k projection

ERROR 9363: Only a table or projection is allowed in the FROM clause of an aggregate projection

ERROR 9364: Only one table or projection is allowed in the FROM clause of an aggregate projection

ERROR 9365: Only table or projection is allowed in FROM clause of aggregate projection

ERROR 9579: Invalid AES key. AES keys should be supplied as a hex string

ERROR 9582: Key length [*value*] is invalid. Supported AES key lengths are 128, 192, and 256

ERROR 9583: Key type [*string*] is not supported

ERROR 9591: RSA keys with passwords are not currently supported

ERROR 9642: Subquery must return only one scalar column

ERROR 9714: Syntax error: keyword SECONDARY cannot be used in CREATE SUBCLUSTER LIKE

ERROR 9720: Top level alias name missing

ERROR 9730: Top-level alias name missing

ERROR 9759: Invalid bound for collection type *string*

ERROR 9788: Recursive query "*string*" does not have the form non-recursive-term UNION [ALL] recursive-term

ERROR 9789: Recursive query "*string*" must not contain data-modifying statements

ERROR 9790: Recursive reference to query "*string*" must not appear more than once

ERROR 9791: Recursive reference to query "*string*" must not appear within a subquery

ERROR 9792: Recursive reference to query "*string*" must not appear within an outer join

ERROR 9793: Recursive reference to query "*string*" must not appear within EXCEPT

ERROR 9794: Recursive reference to query "*string*" must not appear within INTERSECT

ERROR 9795: Recursive reference to query "*string*" must not appear within its non-recursive term

ERROR 9868: LIMIT OVER clause is not allowed in Time Series queries

ERROR 10140: Negative array index *value*

ERROR 10159: Cannot *string* labelled non-loop blocks

ERROR 10160: Cannot *string* unlabelled non-loop blocks

ERROR 10175: Could not find *string*'s target block

ERROR 10185: FETCH statement cannot return multiple rows

ERROR 10188: FOR (RANGE) target name cannot include array indices

ERROR 10189: FOR (RANGE) target name cannot include labels

ERROR 10190: Found no SQL expression where one was required

ERROR 10191: Found unexpected SQL expression

ERROR 10194: IF statements require exactly one condition

ERROR 10196: Invalid TLS Verify mode [*string*]

ERROR 10203: Parameter with the name "*string*" has already been declared

ERROR 10209: SQLSTATE digits may only be numbers or capital letters

ERROR 10210: SQLSTATE must be exactly 5 characters long

ERROR 10221: Variable with the name "*string*" already exists in the same scope

ERROR 10255: Instantiation of nonexistent parameter "*string*"

ERROR 10257: Invalid exception condition name

ERROR 10269: Redundant instantiation of parameter "*string*"

ERROR 10298: Variable "*string*" must be initialized, since it's declared NOT NULL

ERROR 10313: WITH clause query may not have SELECT INTO

ERROR 10325: FOR (RANGE) target must be a single variable

ERROR 10331: Query returned *value* columns for assignment where *value* expected

ERROR 10345: CONTEXT is not yet supported

ERROR 10352: For '*string*', nested array columns are not supported

ERROR 10356: ROW_COUNT is not yet supported

ERROR 10385: Query returned *value* columns where 1 was expected

ERROR 10409: Cursor variables ("*string*") cannot be assigned into

ERROR 10414: Mismatch between the number of format parameters (*value*) and the number of supplied arguments (*value*)

ERROR 10415: Mismatch between the number of parameters (*value*) and the number of supplied arguments (*value*)

ERROR 10424: The option *string* is only available for GET CURRENT DIAGNOSTICS

ERROR 10425: The option *string* is only available for GET STACKED DIAGNOSTICS

ERROR 10448: PL/vSQL parser failed at *string* of source string: *string*

ERROR 10456: TYPE-aliased variable must name a PL/vSQL variable or a SQL column

ERROR 10460: Cannot specify 'CREATE OR REPLACE' and 'IF NOT EXISTS' in

ERROR 10400: Cannot specify 'CREATE OR REPLACE' and 'IF NOT EXISTS' in the same create function statement
ERROR 10461: Cannot specify 'CREATE OR REPLACE' and 'IF NOT EXISTS' in the same create procedure statement
ERROR 10534: Error encountered while tuning annotated query: *string*
ERROR 10535: Error encountered while verifying target query: *string*
ERROR 10536: No '=' found in '*string*', while parsing
ERROR 10540: Tuning doesn't support the action '*string*'
ERROR 10561: MATCH_COLUMNS() can either be specified as an element in a SELECT list, or passed in to a function that allows an unlimited number of arguments
ERROR 10613: Password with provided salt cannot be processed: *string*
ERROR 10625: DEFAULT can only appear once in the FROM clause of an UPDATE
ERROR 10627: Syntax error near "DEFAULT"
ERROR 10629: Argument '*string*' was found more than once while parsing
ERROR 10635: Invalid key-value pair: the correct format is 'key1=value1;key2=value2'
ERROR 10636: Invalid keyword: '*string*'
ERROR 10651: Queries with syntactic hints are not supported

Warning messages

WARNING 2030: *string* has been deprecated as *string string* Vertica option
WARNING 2238: At least two arguments are required

Access rank

Determines the speed at which a column can be accessed. Columns are stored on disk from the highest ranking to the lowest ranking in which the highest ranking columns are placed on the fastest disks and the lowest ranking columns are placed on the slowest disks.

Administration host

The host on which the Vertica rpm package was manually installed. Always run the Administration Tools on this host if possible.

Administration tools

Vertica [Administration Tools](#) provides a graphical user interface for managing a Vertica database. With this tool, you can perform various tasks, including:

- View the state of the database cluster.
- Create a database.
- Start a database.
- Stop a database.
- Run Database Designer.
- Connect to a database using [vsql](#).

Agent

A daemon process that runs on each Vertica cluster node. The agent is used by certain clients, such as Management Console, to administer Vertica.

Agents monitor Vertica database clusters and communicate with their clients to provide the following functionality:

- Provide local access, command, and control over database instances on a given node, using functionality similar to [Administration tools](#)
- Report log-level data from the Administration Tools and Vertica log files
- Cache details from long-running jobs—such as create/start/stop database operations—that you can view through your browser
- Track changes to data-collection and monitoring utilities and communicate updates to clients
- Specifically for MC, communicate between all cluster nodes and MC through a webhook subscription, which automates information sharing and reports on cluster-specific issues like node state, alerts, events, and so on

The agent runs on port 5444, which must be accessible to agent clients.

Anchor table

Database table that is the source for data in a [projection](#). The anchor table and its projection must be in the same schema. The privileges to create, access, or alter a projection are based on the anchor tables that the projection references, as well as the schemas that contain them.

In the following simple statement, public data is the anchor table:

```
=> CREATE PROJECTION publicdataproj AS (SELECT * FROM publicdata);
```

Ancient history mark (AHM)

Also known as AHM, the ancient history mark is the oldest epoch whose data is accessible to [historical queries](#). Any data that precedes the AHM is eligible to be [purged](#).

For detailed information, see [Understanding Vertica Epochs](#) in the [Vertica Knowledge Base](#).

Apportioned load

An *apportioned load* is a divisible load, such that you can load a single data file on more than one node. Apportioned load divides the load at planning time, based on available nodes and cores on each node. Each load starts at a different offset, requiring a parser that supports apportioning. Some of the parsers built into Vertica support apportioned load. Using the SDK, you can write parsers that perform apportioned loads.

Authentication service (AS)

A service that usually runs on the same host as the Kerberos Key Distribution Center (KDC). The AS issues tickets for a requested service. The tickets are in turn given to users for access to the service. The AS answers requests from clients that do not send credentials with a request. The AS is generally used to gain access to the ticket-granting service (TGS) by issuing a ticket-granting ticket (TGT).

Bitstring

A sequence of bits.

Buddy projection

Required for K-safety. Two projections are considered to be buddies if they contain the same columns and have the same hash segmentation, using different node ordering.

For more information, see:

- [High availability with projections](#)
- [Designing segmented projections for K-safety](#)
- [GET_PROJECTION_STATUS](#)

Bulk loading

A process of loading large amounts of data, such as an initial load of historic data.

C-store

A research project at MIT, Brandeis, Brown, and the University of Massachusetts (Boston), on which Vertica is based.

Cardinality

Refers to the number of unique values for a given column in a relational table:

- *High cardinality* : Refers to columns containing values that are highly unique, such as a customer ID or an employee e-mail address. For example, in the Vertica [VMart schema](#), the `employee_dimension` table contains an `employee_key` column. This column contains values that uniquely identify each employee. Since the values in this column are unique and could be numerous, the column's cardinality type is referred to as high cardinality.
- *Normal cardinality* : Refers to columns containing values that are less unique, such as job titles and street addresses. An example of a normal-cardinality column would be `job_title` or `employee_first_name` in the `employee_dimension` table, where many employees could share the same job title or same first name.
- *Low cardinality*: Refers to a low number of unique values, relative to the overall number of records in a table. For example, in the `employee_dimension` table, the column called `employee_gender` would contain two unique values: 'Male' or 'Female'. Since there are only two values possible in this column, cardinality is low.

Catalog

A set of files that contains information (metadata) about the objects—such as nodes, tables, constraints, and projections—in a database. Vertica maintains a catalog on each node in the cluster.

Catalog path

A storage location used to store the database catalog.

Cell

A cell is space in a database object allocated for a single piece of data. For a list of supported data types that can populate a cell, see [Data types](#).

Cluster

The concept of Cluster in the Vertica Analytics Platform is a collection of hosts with the Vertica software packages (RPM or DEB) that are in one admin tools domain. You can access and manage a cluster from one admintools initiator host.

Columnar tables

Vertica database tables consisting of structured data columns. The term differentiates these tables from Flex (or Flexible) tables, which minimally contain one column of unstructured, or semi-structured data. Flex tables can also have structured data columns, but they are not required. Compare with [Flexible tables](#).

Communal storage

The shared storage location containing an Eon Mode database's data. The data within the communal storage is the canonical copy of the data—Vertica does not consider data as being committed until it has been written to communal storage.

The communal data storage location is based on an object store, such as an S3 bucket when Vertica runs in the AWS cloud, or a PureStorage FlashBlade.

Connection node

In the context of [workload routing](#), the connection node is a node in the default subcluster that the client first connects to before being routed to an execution node in some subcluster as specified by the [routing rule](#) associated with the client's workload. The connection node then acts as a proxy between the client and the execution node.

Control node

A node that connects to the [Spread](#) service to send and receive cluster-wide broadcast messages. In databases where the large cluster feature is disabled, all nodes are control nodes. In databases where the large cluster feature is enabled, a subset of nodes are control nodes. Vertica assigns non-control nodes to a control node. These dependent nodes rely on their control node to relay broadcast messages to them. See [Large Cluster](#) for more information.

Execution node

In the context of [workload routing](#), the execution node handles the execution of client queries. Clients are routed to a subcluster containing the execution node based on [routing rules](#).

Cooperative parse

A *cooperative parse* occurs when a single node uses multiple threads to parse data for loading. Cooperative parse divides a load at execution time, based on how threads are scheduled, if the parser supports cooperation. Some of the parsers built into Vertica support cooperative parse. Using the SDK, you can write parsers that perform cooperative parse.

Correlated columns

Two columns are correlated if the value of one column is related to the value of the other column. For example, state name and country name columns are strongly correlated because the city name usually, but perhaps not always, identifies the state name. The city of Conshohocken is uniquely associated with Pennsylvania, whereas the city of Boston exists in Georgia, Indiana, Kentucky, New York, Virginia, and Massachusetts. In this case, city name is strongly correlated with state name.

Critical node

A critical node is a node whose failure would cause the database to become unsafe and force a shutdown. Nodes can become critical for the following reasons:

- A node has the only copy of a particular projection.
- Fewer than half of your nodes are active. In an Eon Mode database, at least half of your primary nodes must be up to maintain data integrity.

The [V_MONITOR.CRITICAL_NODES](#) system table lists the critical nodes, if any, in your cluster.

For more information, see [K-safety in an Enterprise Mode database](#) for Enterprise Mode databases, and [Data integrity and high availability in an Eon Mode database](#) for Eon Mode databases.

Current epoch

The epoch into which data (COPY, INSERT, UPDATE, and DELETE operations) is currently being written.

Data collector

A utility that collects and retains database monitoring information. For details, see [Data Collector utility](#).

Data path

A storage location that contains actual database data files.

Database

A cluster of nodes that, when active, can perform distributed data storage and SQL statement execution through administrative, interactive, and programmatic user interfaces.

Database Designer

A tool that analyzes a logical schema definition, sample queries, and sample data, and creates a physical schema ([projections](#)) in the form of a SQL script that you deploy automatically or manually. The script creates a minimal set of superprojections to ensure K-safety, and, optionally, non-superprojections. In most cases, the projections created by the Database Designer provide excellent query performance within physical constraints.

The Database Designer can create two distinct design types. The design you choose depends on what you are trying to accomplish:

- [Comprehensive](#)
- [Incremental](#)

You can also [create custom designs](#) if the Database Designer does not meet your needs.

For detailed information, see [Creating a database design](#).

Database superuser

The automatically-created database user who has the same name as the Linux database administrator account and who can bypass all GRANT/REVOKE authorization, or any user that has been granted the PSEUDOSUPERUSER role. Do not confuse the concept of a database superuser with Linux superuser (root) privilege. A database superuser cannot have Linux superuser privilege.

Default subcluster

The default subcluster is the subcluster Vertica adds new nodes to if you do not specify a subcluster to contain the new nodes. Your database can only have a single default subcluster. You can make a subcluster the default using the [ALTER SUBCLUSTER](#) statement.

DELTAVAL (delta encoding)

Stores only the differences between sequential data values instead of the values themselves.

Depot

A cache of data maintained by the nodes in an Eon Mode database to limit reads from [communal storage](#). Retrieving data from communal storage often has high latency and potentially limited bandwidth, especially in cloud environments. Each node in the database caches the data it reads from and writes to the communal storage. When processing a query, they first check this local cache for the data they need. If the data is cached locally, the nodes use the cached version instead of retrieving the data from communal storage.

Depot warming

On startup, the depots of new nodes are empty, while the depots of restarted nodes often contain stale data that must be refreshed. When depot warming is enabled, a node that is undergoing startup preemptively loads its depot with frequently queried and pinned data. When the node completes startup and begins to execute queries, its depot already contains much of the data it needs to process those queries. This reduces the need to fetch data from communal storage, and expedites query performance accordingly.

Note

Fetching data to a warming depot can delay node startup.

For details, see [Managing depot caching](#).

Derived column

A column whose values are calculated by an expression at load time. The expression is specified within the COPY statement, and the column exists in the target database.

Dimension table

Sometimes called a lookup or reference table, a dimension table is one of a set of companion tables to a large (fact/anchor) table in a star schema. It contains the PRIMARY KEY column corresponding to the join columns in fact tables. For example, a business might use a dimension table to contain item codes and descriptions.

Dimension tables can be connected to other dimension tables to form a hierarchy of dimensions in a snowflake schema.

Directed query

A saved set of instructions that direct the optimizer to generate a query plan for a given query. The query plan consists of SQL annotated with hints. A directed query pairs two components:

- *Input query*: A query that triggers use of this directed query when it is active.
- *Annotated query*: A SQL statement with embedded optimizer [hints](#). The annotated query is used by the optimizer in creating a query plan for the specified input query.

Encoding

The process of converting data into a standard format. In Vertica, encoded data can be processed directly, while compressed data cannot. Vertica uses a number of different encoding strategies, depending on column data type, table cardinality, and sort order.

Enterprise Mode

A database mode that optimizes your database for analytic speed. This is the "original" mode of the Vertica database—the only mode it supported before Eon Mode was introduced. In this mode, data is stored by the database nodes. This proximity allows nodes to operate on locally stored data for most queries, reducing query times. An Enterprise Mode database is harder to scale up and down than an Eon Mode database, which is optimized for scalability.

Eon Mode

Eon Mode is the database mode that optimizes your database for scalability. This mode separates data storage from computing resources. By separating the two, you can add or remove nodes from your cluster to adjust growing or shrinking analytic workloads. Scaling the cluster size does not affect running queries. Eon Mode is especially well-suited for cloud environments. See [Eon Mode concepts](#) for more information.

Epoch

A logical unit of time in which a single change is made to data in your Vertica database.

For detailed information, see [Epochs](#).

Epoch map

A catalog object that provides mapping between time and epochs. Specifically, an epoch map contains a list of epoch numbers and their associated timestamps.

Executor node

Any node that participates in executing a specific SQL statement. The initiator node can, and usually does, also function as an executor node.

Expression

An expression is anything that can represent a single column in a [SELECT](#) statement.

For example, the following are all expressions:

```
1+2
foo(3)
x
```

External procedure

A procedure external to Vertica that you create, maintain, and store on the server.

Event series

Tables with a time column, most typically a timestamp data type.

Flexible tables

Vertica database tables that minimally contain two columns:

[__identity__](#) : A real column with an incrementing IDENTITY value for partitioning and sorting. Used if no other columns serve this purpose.

[__raw__](#) : A real **LONG VARBINARY** column containing unstructured, or semi-structured data.

You can create Flex tables with additional real columns, but they are not required. Compare with [Columnar tables](#).

Flattening (subqueries and views)

Occurs when a subquery or named view is internally rewritten so the subquery is combined with the outer query block. The result sets of the original and flattened queries are exactly the same, but the flattened query usually benefits from significant performance improvements.

Full backup

Consists of copying each catalog and all data files (ROS containers) on each node, as well as the complete `/opt/vertica/config` directory.

GENERAL pool

A special built-in pool that represents the total amount of RAM available to the resource manager for use by queries. Other pools can borrow memory from the GENERAL pool. See also [Built-in pools](#).

Grant

Vertica defines GRANT in two ways:

1. Grant a user privileges to access database objects using any [GRANT statement](#), except GRANT (Authentication).
2. Associate a user-defined authentication method with a user through [GRANT \(Authentication\)](#). This operation differs from GRANT <privileges> as authentication methods are “associated” with a user or role and privileges are “granted” to a user or role.

Examples

Grant Access Privileges to a User

This example shows how to grant a user, Joe, privileges to access the online_sales schema:

```
=> GRANT USAGE ON SCHEMA online_sales TO Joe;
```

Associate an Authentication Method with a User

This example shows how to associate the v_ldap authentication method to user jsmith:

```
=> GRANT AUTHENTICATION v_ldap TO jsmith;
```

Grouped ROS

A grouped ROS is a highly-optimized, read-oriented physical storage structure organized by projection. A grouped ROS makes heavy use of compression and indexing. Unlike a ROS, a grouped ROS stores data for two or more grouped columns in one disk file.

Hash segmentation

Specifies how to segment projection data for distribution across all cluster nodes. You can specify segmentation for a table and a projection. If a table definition specifies segmentation, Vertica uses it for that table's [auto-projections](#).

It is strongly recommended that you use Vertica's built-in [HASH](#) function, which distributes data evenly across the cluster, and facilitates optimal query execution.

For more detailed information, see [Segmented projections](#).

Historical data

Refers to any data in memory or physical storage other than the current epoch. Historical data includes all COPY, INSERT, UPDATE, and DELETE operations, including deleted rows. This allows Vertica to run a historical query on data written up to and including the epoch representing the specified date and time.

Historical query

A query that retrieves data from a snapshot of the database, taken at a specific timestamp or epoch. For details, see [Historical queries](#).

Immutable (invariant) functions

When run with a given set of arguments, immutable functions always produce the same result, regardless of environment or session settings such as locale.

Initiator node

In the context of a client connection, the initiator node is the node associated with the specific host to which the connection was made. The initiator node can, and usually does, also function as an executor node, and is generally where the most descriptive log messages reside.

K-safety

K-safety sets fault tolerance for the database cluster, where K can be set to 0, 1, or 2. The value of K specifies how many copies Vertica creates of [Segmented projections](#) data. If K-safety for a database is set to 1 or 2, Vertica creates K+1 instances, or *buddies*, of each projection segment. Vertica distributes these buddies across the database cluster, such that projection data is protected in the event of node failure. If any node fails, the database can continue to process queries so long as buddies of data on the failed node remain available elsewhere on the cluster.

For more information, see [Designing for K-safety](#).

Last epoch

The last epoch is the current epoch minus one. SELECT statements under READ COMMITTED isolation read from the last epoch.

Last good epoch (LGE)

A term used in manual recovery, LGE (Last Good Epoch) refers to the most recent epoch that can be recovered.

Live aggregate projection

A live aggregate projection contains columns with values that are aggregated from columns in its anchor table. When you load data into the table, Vertica aggregates the data before loading it into the live aggregate projection. On subsequent loads—for example, through [INSERT](#) or [COPY](#)—Vertica recalculates aggregations with the new data and updates the projection.

Locale

Locale specifies the user's language, country, and any special variant preferences, such as collation. Vertica uses locale to determine the behavior of certain string functions. Locale also determines the collation for various SQL commands that require ordering and comparison, such as aggregate [GROUP BY](#) and [ORDER BY](#) clauses, joins, and the analytic [ORDER BY](#) clause.

The default locale for a Vertica database is [en_US@collation=binary](#) (English US). You can define a new default locale that is used for all sessions on the database. You can also override the locale for individual sessions. However, projections are always collated using the default [en_US@collation=binary](#) collation, regardless of the session collation. Any locale-specific collation is applied at query time.

If you set the locale to null, Vertica sets the locale to [en_US_POSIX](#). You can set the locale back to the default locale and collation by issuing the vsqll meta-command [\locale](#). For example:

Note

```
=> set locale to "";
INFO 2567: Canonical locale: 'en_US_POSIX'
Standard collation: 'LEN'
English (United States, Computer)
SET
=> \locale en_US@collation=binary;
INFO 2567: Canonical locale: 'en_US'
Standard collation: 'LEN_KBINARY'
English (United States)
=> \locale
en_US@collation=binary;
```

You can set locale through [ODBC](#), [JDBC](#), and [ADO.net](#).

Logical schema

Consists of a set of tables and referential integrity constraints in a Vertica database. The objects in the logical schema are visible to SQL users. The logical schema does not include projections, which make up the physical schema.

Location label

A label assigned to a storage location. Location labels identify the location so you can create object storage policies. The labeled location you use in a storage policy becomes the default storage location for the object.

Management Console

A database management tool that provides a unified view of your Vertica database and lets you monitor multiple clusters from a single point of access. See [Management Console](#).

MC SUPER administrator (superuser)

Called **Super** on the MC interface, the MC SUPER administrator is the Linux user account that gets created when you [configure MC](#). For details, see the following:

- [Configuring Management Console](#)
- [Configuration roles in MC](#)

MC-managed database

A Vertica database that an MC SUPER or ADMIN user creates on MC or imports into the MC interface, along with the database cluster. When MC users are granted database privileges, their privileges are defined through the MC itself and pertain only to databases managed on the MC. See [Users, roles, and privileges in MC](#).

Mergeout

Mergeout is a Tuple Mover process that consolidates ROS containers and purges deleted records.

Meta-functions

Used to query or change the internal state of Vertica and are not part of the SQL standard.

Meta-functions can be used in a top-level SELECT statement only, and the statement cannot contain other clauses such as FROM or WHERE.

Metadata

Data that describes the data in a database, such as data type, compression, constraints, and so forth, for each column in the tables. Metadata is stored in the Vertica catalog.

Mutual mode

When a database is configured for TLS/SSL security in *mutual mode*, incoming client requests verify the certificate of the server, and the server also requires that each client present a certificate and private key so that the server can verify the client.

Node

A host configured to run an instance of Vertica. It is a member of the database cluster. For a database to have the ability to recover from the failure of a node requires a database K-safety value of at least 1 (3+ nodes).

Non-repeatable read

Occurs in a READ COMMITTED isolation level when two identical queries in the same transaction produce different results. This occurs when another transaction commits changes that alter the results of the query after the first query has completed and before the second query has begun.

NUL

Represents a character whose ASCII/Unicode code is zero, sometimes qualified "ASCII NUL".

NULL

Means *no value*, and is true of a field (column) or constant but not of a character.

OID

An object identifier (OID) is an identifier used to name an object. Structurally, an OID consists of a node in a hierarchically-assigned namespace, formally defined using the International Telecommunication Union-Telecommunication's (ITU-T) Abstract Syntax Notation standard (ASN.1). Vertica database objects are always assigned an OID. The OID can be used directly in some statements, such as [HAS_TABLE_PRIVILEGE](#).

Source: Wikipedia

Parallel load

Parallel load is the process of loading data on any available node in the cluster (not necessarily the local node). Use this approach in combination with wildcards (such as *.dat) to load data files in parallel in a distributed manner. See COPY ON ANY NODE in [Parameters](#).

Path (quality plan)

The execution strategy of the Vertica cost-based query optimizer, denoting a sub operation in the query plan.

Partitioning

Specifies how data is organized within individual nodes. Partitioning attempts to introduce hot spots within the node, providing a convenient way to drop data and reclaim the disk space.

Note

Partitioning and segmentation are terms often used interchangeably for other databases, but they have completely separate goals in Vertica regarding data localization. See [Partitioning and segmentation](#) in the Administrator's Guide for details.

Phantom read

Occurs in a READ COMMITTED isolation level when two identical queries in the same transaction produce different collections of rows. This occurs because a table lock is not acquired on SELECT during the initial query.

Physical schema

Consists of a set of projections used to store data on disk. The projections in the physical schema are based on the objects in the logical schema.

Physical schema design

A usable K=1 design based on an analysis of the sample data files and queries (if available). The physical schema design contains segmented (fact table) superprojections and replicated (dimension table) superprojections.

Primary column

A column that is loaded from raw data, and not derived from an expression.

Primary node

In Eon Mode, a primary node is a node that is a member of a [primary subcluster](#). Primary nodes are the only nodes in the database that Vertica considers when determining whether the database is able to maintain data integrity. Vertica requires that more than half of the primary nodes in the database be up. Also, all shards must have at least one primary node as a subscriber. If either of these conditions are not met, Vertica shuts the database down to prevent potential data corruption.

Primary subcluster

In Eon Mode, a primary subcluster is a type of subcluster that is intended to form the core of your database. Vertica only considers the nodes in primary subclusters when determining the [K-safety](#) of your database. Your database can remain running as long as half the nodes in your primary subclusters are up, and all shards have at least one node in a primary subcluster as a subscriber. See [Subcluster Types and Elastic Scaling](#) for more information.

Primary subscriber

In an Eon Mode database, each shard has a primary subscriber node. This node is responsible for running Tuple Mover processes that maintain the data in the shard.

Projection

Optimized collections of table columns that provide physical storage for data. A projection can contain some or all of the columns of one or more tables.

For more information about Vertica projections, see [Projections](#).

Projection set

A group of buddy projections that are safe for a given level of K-safety. When K=1, there are two buddies in a set; when K=2, there are three buddies. The Database Designer assigns all projections in a projection set the same base name so they can be identified as a group.

A projection must be part of a projection set before it is refreshed. Once a projection set is created (by creating buddies), the set is refreshed in a single transaction.

Query cluster level

Determines the number of sets used to group similar queries. The query cluster level can be any integer from one (1) to the number of queries to be included in the physical schema design.

Queries are generally grouped based on the columns they access and the way in which they are used. The following work loads typically use different types of queries and are placed in different query clusters: drill downs, large aggregations, and large joins. For example, if a reporting tool and dashboard both access the same database, the reporting tool is likely to use a drill down to access a subset of data and the dashboard is likely to use a large aggregation to look across a large range of data. In this case, there would be at least two (2) query clusters.

Query optimizer

The component that evaluates different strategies for running a query and picks the best one.

Quorum

Your database has a minimum number of nodes that must be up and part of the database cluster for the database to continue operating. When this minimum requirement is met, your database has a quorum of nodes.

The number of nodes that make up a quorum depends on the database mode:

- In Enterprise Mode, over half the nodes (50% of total nodes + 1) must be up.
- In Eon Mode, over half of the [primary nodes](#) in the cluster must be up.

The database can lose quorum if too many nodes go down. The database's reaction to losing quorum also depends on the database's mode:

- An Enterprise Mode database that loses quorum shuts down to prevent potential data corruption.
- An Eon Mode database that loses quorum goes into read-only mode to prevent potential data corruption. In this mode, you can usually execute queries, but DDL and DML statements fail with an error.

For more on database availability, see [K-safety in an Enterprise Mode database](#) and [Data integrity and high availability in an Eon Mode database](#).

Recovery

Vertica can restore the database to a fully functional state after one or more nodes in the system experiences a software- or hardware-related failure. Vertica recovers nodes by querying replicas of the data stored on other nodes. For example, a hardware failure can cause a node to lose database objects or to miss changes made to the database (INSERTs, UPDATEs, and so on) while offline. When the node comes back online, queries other nodes in the cluster to recover lost objects and catch up with database changes.

Referential integrity

Consists of a set of constraints (logical schema objects) that define primary key and foreign key columns.

- Each small table must have a PRIMARY KEY constraint.
- The large table must contain columns that can be used to join the large table to smaller tables.
- Outer join queries produce the same results as the corresponding inner join query if there is a FOREIGN KEY constraint on the outer table. Note that the inner table of the outer join query must always have a PRIMARY KEY constraint on its join columns.

Refresh (projections)

Ensures that all projections on a node are up-to-date (can participate in query execution). This process could take a long time, depending on how much data is in the table(s).

For more information, see [Refreshing projections](#).

Resegmentation

A process that Vertica performs automatically during query execution that distributes the rows of an existing projection or intermediate relation evenly to each node in the cluster. At the end of resegmentation, every row from the input relation is on exactly one node. Vertica resegs data when the input does not have the [segmentation](#) required to compute the requested result efficiently and correctly.

Resource pool

A resource pool comprises a pre-allocated subset of the system resources, with an associated queue. A resource pool is created using the [CREATE RESOURCE POOL](#) command as described in the SQL Reference Manual.

Resource manager

In a single-user environment, the system can devote all resources to a single query and get the most efficient execution for that one query. However, in a environment where several concurrent queries are expected to run at once, there is tension between providing each query the maximum amount of resources (thereby getting fastest run time for that query) and serving multiple queries simultaneously with a reasonable run time. The Resource Manager provides options and controls for resolving this tension, while ensuring that every query eventually gets serviced and that true system limits are respected at all times.

Role

A role groups together a set of privileges that can be assigned to a user or another role. You can use roles to quickly grant or revoke privileges on multiple tables, schemas, functions or other database entities to one or more users with a single command.

Vertica's implementation of roles conforms to the SQL Standard T331 for basic roles.

Rollback

Transaction rollbacks restore a database to an earlier state by discarding changes made by that transaction. Statement-level rollbacks discard only the changes initiated by the reverted statements. Transaction-level rollbacks discard all changes made by the transaction.

With a **ROLLBACK** statement, you can explicitly roll back to a named savepoint within the transaction, or discard the entire transaction. Vertica can also initiate automatic rollbacks in two cases:

- An individual statement returns an **ERROR** message. In this case, Vertica rolls back the statement.
- DDL errors, systemic failures, dead locks, and resource constraints return a **ROLLBACK** message. In this case, Vertica rolls back the entire transaction.

Explicit and automatic rollbacks always release any locks that the transaction holds.

ROS (Read optimized store)

Read Optimized Store (ROS) is a highly optimized, read-oriented, disk storage structure, organized by projection. ROS makes heavy use of compression and indexing.

Savepoint

A *savepoint* is a special marker inside a transaction that allows commands that execute after the savepoint to be rolled back. The transaction is restored to the state that preceded the savepoint.

Vertica supports two types of savepoints:

- An *implicit savepoint* is automatically established after each successful command within a transaction. This savepoint is used to roll back the next statement if it returns an error. A transaction maintains one implicit savepoint, which it rolls forward with each successful command. Implicit savepoints are available to Vertica only and cannot be referenced directly.
- *Named savepoints* are labeled markers within a transaction that you set through [SAVEPOINT](#) statements. A named savepoint can later be referenced in the same transaction through [RELEASE SAVEPOINT](#), which destroys it, and [ROLLBACK TO SAVEPOINT](#), which rolls back all operations that followed the savepoint. Named savepoints can be especially useful in nested transactions: a nested transaction that begins with a savepoint can be rolled back entirely, if necessary.

Secondary subcluster

A secondary subcluster is a type of subcluster that is easy to start and shutdown on demand. In Eon Mode, Vertica does not consider the nodes in a secondary subcluster when determining whether the database has shard coverage or a quorum of nodes. You can stop or remove secondary subclusters without causing the database to go into read-only mode. See [Subcluster Types and Elastic Scaling](#) for more information.

Segmentation

Defines how physical data storage (projections) is stored in a database cluster using the [CREATE PROJECTION](#) statement. The goal is to distribute data evenly across multiple nodes in the database so that all nodes can participate in query execution.

Note

Partitioning and segmentation are terms often used interchangeably for other databases, but they have completely separate goals in Vertica regarding data localization. See [Partitioning and segmentation](#) in the Administrator's Guide for details.

Server mode

When a database is configured for TLS/SSL security in *server mode*, incoming client requests do verify the certificate of the server, but the server does not verify the clients. In Vertica, the server is the Vertica database server, and the client is any Vertica user who logs into the database. The Vertica client user may log in to the database directly in a command window, or may connect to the Vertica database server via the Management Console running in a browser.

Session

An occurrence of a user interacting with a database through the use of SQL statements. You can start a session using vsql or a JDBC application. In Vertica, the scope of a session is the same as that of a connection. Connecting to the database starts a session, and exiting ends it.

Session-scoped data is preserved beyond the lifetime of a single transaction. Terminating a session truncates a table and deletes all rows.

Shard

A subset of the data and associated metadata stored in an Eon Mode database. Shards are how Vertica divides the work of processing queries, data loads, and data maintenance between the nodes in a subcluster. Nodes subscribe to one or more shards. When processing a query, each node is responsible for processing the data in the shard or shards to which it subscribes.

The number of shards that data is segmented into depends on the shard count of the [namespace](#) to which the data belongs. By default, the database contains a single namespace, `default_namespace`, with the shard count specified during database setup. You can create additional namespaces using the [CREATE NAMESPACE](#) statement.

Shards have a single primary subscriber in the database cluster. The primary subscriber node maintains the data in the shard by running [Tuple Mover](#) processes on it.

Shard coverage

In an Eon Mode database, nodes in a subcluster subscribe to one or more shards in communal storage. Each node handles the data in the shard or shards it subscribes to when processing queries. When a subcluster has at least one node subscribed to each shard, it has shard coverage. It is able to process queries because it has access to all of the data in the database. In a K-safe database, each subcluster has at least two nodes subscribing to each node. If the subcluster loses too many nodes in rapid succession, it may no longer have a node subscribing to each shard. In this case, the subcluster loses shard coverage and cannot process queries.

The database cluster as a whole must have at least one [primary node](#) subscribed to each shard in communal storage. This state is called having primary shard coverage. Primary nodes coordinate the maintenance of data in communal storage. If the cluster loses primary nodes to the point that it does not have at least one subscribed to each shard, it loses primary shard coverage. In this case, the database goes into read-only mode because it is unsafe to alter the data in communal storage when one or more shards do not have a primary node subscriber.

See [Data integrity and high availability in an Eon Mode database](#).

Snapshot isolation

An [historical query](#) that gets data from the latest epoch (**AT LATEST EPOCH**). For details, see [Historical queries](#).

Spread

An open source toolkit used in Vertica to provide a high performance messaging service that is resilient to network faults. Spread daemons start automatically when a database starts up for the first time, and the spread process runs on [control nodes](#) in the cluster.

Sort-merge join

If both inputs are pre-sorted, merge joins do not have to do any pre-processing. Vertica uses the term sort-merge join to refer to the case when one of the inputs must be sorted prior to the merge join. Vertica sorts the inner input side but only if the outer input side is already sorted on the join keys.

Stable functions

When run with a given set of arguments, stable functions produce the same result within a single query or scan operation. However, a stable function can produce different results when issued under different environments or at different times, such as change of locale and time zone—for example, [SYSDATE](#).

See also [Immutable \(invariant\) functions](#).

Statement

A line of SQL, excluding the semicolon. For example, the following are all statements:

```
SELECT * FROM foo WHERE bar = 6
CREATE TABLE t1 (i INT);
INSERT INTO t1 VALUES(3)
```

Storage location

A directory path used by Vertica to store catalog, actual data files, and temporary data files. You can also create storage locations for users, and then grant one or more users access to the storage. You can also create a storage location with a location label, for use in storage policies.

Storage policy

A database object you create to associate a labeled location as the default storage location for the object. Database object can be a database, schema, table, or min- and max- ranges of a partition.

Strict

Indicates that a function always returns null when any of its input arguments is null.

Subcluster

A subset of a cluster in an Eon Mode database. Subclusters isolate workloads to a group of nodes, letting you separate tasks such as load and query.

Subclusters come in two types:

- **Primary subclusters** count when Vertica determines whether the database can continue to run safely. Your database shuts down if less than half the primary nodes in your database are up, or does not have a primary node as a subscriber. Primary subclusters are best used for data loading and DDE workloads.
- **Secondary subclusters** do not count towards maintaining data integrity. You can shut them down without impacting the stability of the database. Secondary subclusters are best used for query workloads. They cannot commit transactions directly, so they are less efficient at performing data loads and DDE statements.

Superprojection

A projection that includes all columns in an anchor table. Vertica uses superprojections to ensure support for all queries and other DML operations.

Under certain conditions, Vertica [automatically creates a table's superprojection](#) immediately on table creation. Vertica also creates a superprojection when you first load data into that table, if none already exists. [CREATE PROJECTION](#) can create a superprojection if it specifies to include all table columns. A table can have multiple superprojections.

For more information, see [Creating projections](#).

Temp location

A storage location used as [temp space](#) by Vertica.

Temp space

Disk space temporarily occupied by temporary files created by certain query execution operations, such as hash joins and sorts, in the case when they have to spill to disk. Such operations might also be encountered during queries, recovery, refreshing projections, and so on. If a [temp location](#) is provided to the database, Vertica uses it as temp space.

Top-k projection

A projection that configures the projection data for a Top-K query. A Top-K query is one that retrieves the top k rows from a group of tuples.

A Top-K projection is a type of [live aggregate projection](#).

Transaction

One or more operations that are executed as a unit of work. At the user level, transactions occur in the current session by a user or script running one or more SQL statements. When you commit a transaction, any changes you make to data in tables using **INSERT**, **DELETE**, **UPDATE**, **MERGE**, and **COPY** during the transaction become permanent. If you roll back the transaction, all changes made to table data are undone.

Vertica supports Atomicity, Consistency, Isolation, and Durability (ACID) for SQL transactions.

Tuple mover (TM)

The Tuple Mover manages ROS data storage. On [mergeout](#), it combines small ROS containers into larger ones and purges deleted data.

UDx

User-defined extensions (UDxs) are functions contained in external libraries that are developed in C++, Python, Java, or R using the Vertica SDK. The external libraries are defined in the Vertica catalog using the [CREATE LIBRARY](#) statement. They are best suited for analytic operations that are difficult to perform in SQL, or that need to be performed frequently enough that their speed is a major concern.

Up-to-date (projection)

A projection is up-to-date (or up to date) if it is eligible to participate in query execution. Projections on empty tables are up-to-date upon creation. If the table has data loaded already, newly created projections are marked not up-to-date until refreshed. If a projection is refreshed while a node is down, that projection can be marked up-to-date even though it is missing data on one of the nodes. This is because the node will build the data during the recovery process before participating in queries.

User-defined SQL function

User-defined SQL functions let you define and store commonly-used SQL expressions as a function. User-defined SQL functions are useful for executing complex queries and combining Vertica built-in functions. You simply call the function name you assigned in your query.

A user-defined SQL function can be used anywhere in a query where an ordinary SQL expression can be used, except in a table partition clause or the projection segmentation clause.

View

A named logical relation specified by an associated query that can be accessed similarly to a table in the FROM clause of a SQL statement. The results of the query are not stored but obtained on the fly when the SQL referencing the view is executed.

Volatile functions

Regardless of their arguments or environment, volatile functions can return a different result with each invocation—for example, [UUID_GENERATE](#).

vsq

vsq is a character-based, interactive, front-end utility that lets you type SQL statements and see the results. It also provides a number of meta-commands and various shell-like features that facilitate writing scripts and automating a variety of tasks.

For more information, see [Installing the vsq client](#) and the more general topic, [Using vsq](#).

Window (analytic)

An analytic function's **OVER** clause specifies how to partition, sort, and frame function input with respect to the current row. The input data is the result set that the query returns after it evaluates **FROM** , **WHERE** , **GROUP BY** , and **HAVING** clauses.

Working data size

The amount of data that most of your queries operate on. In most Vertica databases, you store more data than you regularly query. For example, suppose you are storing sales data for a corporation. You may keep many years of sales data in your database. However, the majority of queries you run may only query the last year of data to determine current sales trends. In that case, your working data size is the amount of sales data you load into the database in a year.

Knowing your working data size is important when configuring an Eon Mode database. You want the total size of the depots in all of the nodes a subcluster to be large enough to fit the working data size. Note that the working data size may vary per subcluster. Some subclusters may only work on recently-loaded data, while others do many queries on a larger data set.

Workload analyzer

An advisor tool that analyzes system information held in [SQL system tables](#) (monitoring APIs) and returns a set of tuning recommendations. See [Analyzing workloads](#) in the Administrator's Guide for details.
